J. M. T. Automatic Injector

Made in Canada

Made according to the most approved ideas with connections to suit any requirement. Injectors start from 2 to 3 lbs. of steam pressure when water is taken from a barrel or tank, at level of the Injector. With water pressure of 20 lbs. they start at from 10 to 12 lbs. of steam and work up to 175 lbs. Used for low pressure in steam heating plants.

We also make our J.M.T. Improved Injector for Working Pressures up to 220 lbs. Steam.

Send us your Injector enquiries.

Five Facts about Famous Five Files

They are made from high carbon steel.

The heat treatment for each file is scientifically determined.

The grinding is done by machinery, which insures a perfect surface for cutting.

The teeth are mathematically accurate, insuring a sharp, even cut.

They are recognized as standard tools by mechanics everywhere.

Be on the safe side and specify "Famous Five" Files when ordering.

FOR SALE

Standing Timber

in Large or Small Blocks

and

Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery For Sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.
1 Double cylinder steam nigger, right hand.
1 Log Loader for right hand mill.
1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.
1 left-hand steam nigger.
1 Log-loader.
1 Endless chain jack ladder with two kickers complete for right and left hand mills.
2 Roger Gang Edgers for 8-in. cants and lumber.
1 Waterous double edger, 6 saws.
1 2-saw Trimmer.
1 20-ft. Slash Table.
1 16-ft. Revolving Slash Table
1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.
1 Lath Mill with bolter.
2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.
5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
2 125 h.p. Water Wheels.
1 Upright Engine for sawdust conveyor.
1 10 h.p. Engine.
1 Wood Machine for 22-in. wood.
1 Edger for ripping dry lumber, installed.
1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

Rubber Goods FOR LUMBERMEN

Belting Our long experience in the making of Rubber Belts enables us to specialize on this line. "P.M.S.," "Special Drive" and "Lion" are our leading brands for power transmission.

Packings "Redstone" High Pressure Sheet Packing has proved by test that it will outlast any other similar packing on the market. We make Spiral and Ring Packings, etc., that are equally reliable.

Hose for Steam, Water, etc., in various grades, made especially to give satisfactory and economical service under different conditions.

Fire Hose One or more of our twenty brands of Fire Hose will be found, not only in the best equipped Factories, Mills, etc., but in almost every Fire Department in the Dominion.

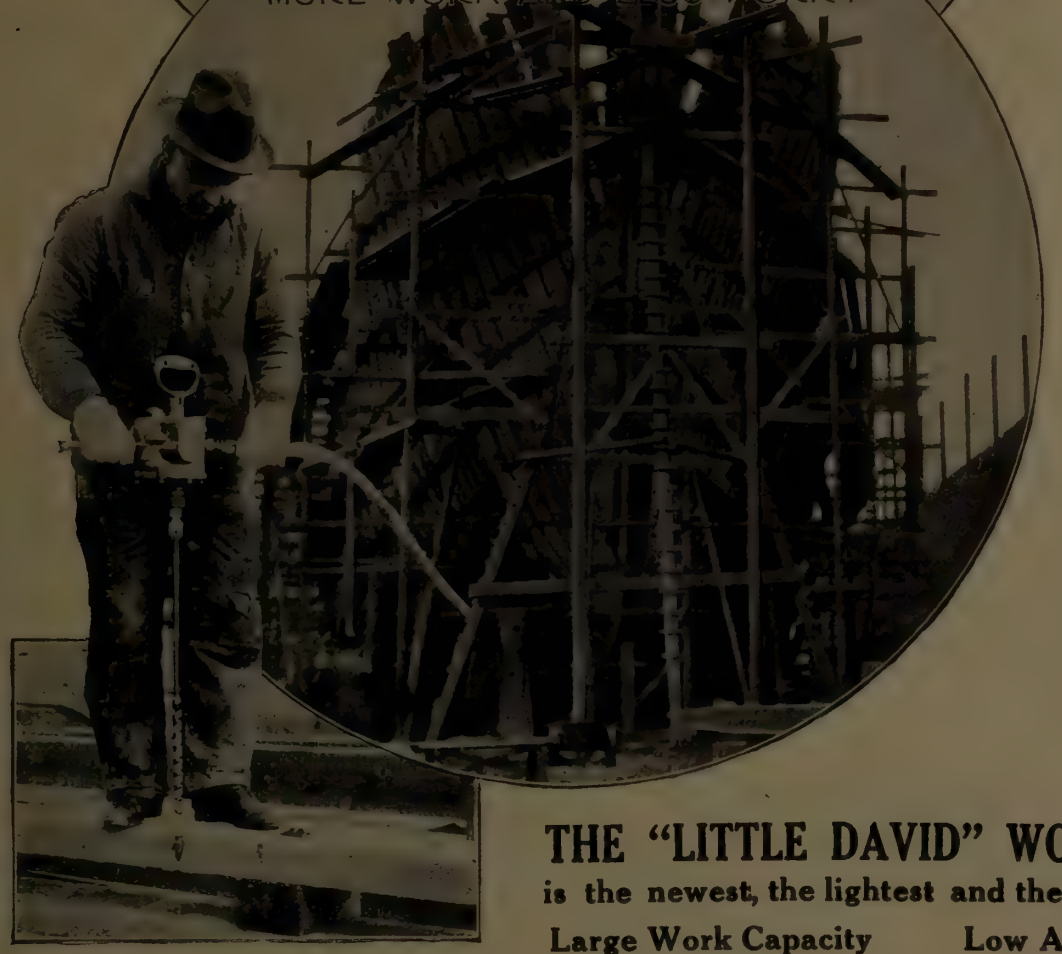
YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING
MORE WORK AND LESS WORRY



THE "LITTLE DAVID" WOOD BORER
is the newest, the lightest and the most powerful.

Large Work Capacity
Easy to Operate
Low Air Consumption
Low Cost of Upkeep

Leading shipbuilding companies are standardizing "LITTLE DAVID" Tools because of their capacity for work, ready control and low air consumption. Other features which have turned the scale in favor of these tools are their simple construction and low upkeep costs.

Our No. 40 "LITTLE DAVID" Riveter is being widely used in wooden shipbuilding, for "horsing" in oakum, etc. This tool is a wonderful time-saver in this industry, where time now counts so much. Bulletins covering the "LITTLE DAVID" Tools, as well as prices, etc., will be gladly sent on request to your address. Write nearest branch office to-day.

"LITTLE DAVID" Tools for shipbuilding comprise Chipping and Riveting Hammers, Drills, Reamers, Grinders, Wood Borers, etc. The "LITTLE DAVID" Wood Borer shown above is made in three sizes, boring holes 1 in. to 4 in. The machine is reversible, and the largest size is about 10 lbs. lighter than other wood boring machines of the same capacity.

Another desirable tool is our CC-101 Drift Bolt Driver. With it, bolts can be driven in any position and at any angle. Two men with one of these machines, will drive a 1⅜" diameter bolt 5 ft. long, with 100 lbs. air pressure through oak with 1/16" drift at the rate of 5 ft. in 25 seconds. This is a great advance over driving these bolts with a sledge hammer. Our nearest branch will be pleased to give you full information.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Railways Asking Too Much

Proposed railway freight tariff increases, and actual increases in the cost of shipping lumber resulting from advanced minimums and increased stop-over charges, have been coming thick and fast of late, and the question arises where they will stop, or how long the lumbermen will stand for it. Apparently the railway companies will keep it going just so long as they find they can get away with it. In the face of events that have been taking place in the railway world it is difficult to justify the increases that are being asked for, and so often permitted, by the Dominion Board of Railway Commissioners.

Take the matter in its widest possible bearing and it becomes evident that any increases permitted to the Grand Trunk and the Canadian Northern on the plea that they must have greater earnings in order to continue in operation will amount to a gift to the Canadian Pacific Railway, which must be granted the same permission to increase rates, even though it is already operating at a profit. The argument of the railways, whenever they seek to justify the increase, is that they need the mony, yet the Canadian Pacific Railway gets along well without it. The reason, therefore, must be sought elsewhere, and it is to be found in the unfortunate history of the railway companies which to-day are financially in such difficult straits.

Will the remedy of increased rates for their services be of any avail, so far as the shipping public is concerned, in the direction of affording them greater facilities for making shipment? It is greatly to be doubted whether this will be the case. The financial history of the Grand Trunk Railway, for instance, indicates strongly that the increases will not enable the company to do any better; in short, it indicates that the remedy proposed is only a temporizing one, and that what the railways need is not a financial tonic, but a surgical operation.

The average shipper, perhaps, does not look into the financial condition of the railways as much as he should, and for this reason some of them to-day are showing sufficient sympathy with the railways to back them up to a considerable extent in their requests for a flat rate increase of 15 per cent. in their freight charges. What will they do with this money if they get it? While only they can answer this question, it is important to look into their past record. First of all, the Grand Trunk Railway is managed in London, a situation which cannot be ideal under any conditions. The Grand Trunk pays dividends upon its preference shares to the average amount of $3,610,643 annually. Its common shares have never paid any dividends. It is hard for the layman, and particularly hard for the shipper, to understand why the preference shares should be paying a dividend while the company is not investing sufficient money in maintenance and equipment to enable it to meet the demands upon its system. Should not the money that is going into dividends be devoted to improving the road's ability to serve the public and, as a result, improving its own position from the point of view of its future dividend-earning capacity?

That this view is a sound one is pretty generally conceded. Sir Henry Drayton and Mr. W. M. Ackworth, in their report to the government upon this point, set the matter forth quite clearly and simply. "The average amount paid in dividends by the Grand Trunk Railway," they say in their report, "has been $3,600,000 per annum. So the stock exchange valuation practically capitalizes the dividends on 5 per cent. basis. And this, in a rapidly-developing country, might be reasonable if the dividends had been earned and could be maintained. But, in view of the statement of the company's own officers that $21,000,000, which ought to have been spent out of revenue for maintenance, has not been so spent, it cannot be contended that the dividends have been earned. In view of the further fact that the company has to face immediate liabilities of over $5,000,000 per annum in connection with the Grand Trunk Pacific, and of the statement of its own officers that a capital expenditure of $30,000,000 is immediately required on its own lines to put the company in proper condition to do its existing business, it can still less be contended that the dividends are maintainable. . . . It is evident that the Grand Trunk Company is not, and will not be for some time to come, in a position entitling it to pay out any money at all in dividends."

When the government commissioners, who enquired into the situation closely, have no hesitation in saying that the company is not earning its dividends, and that these dividends have been paid regularly, it is difficult to make the shipping public feel that they are getting a square deal when they are compelled to pay increased rates for the transportation of their goods. If the dividends were cut off, and if unearned dividends had not been paid in the past, they would be able to look at the matter from a very different point of view.

A peculiar part of the whole situation is the indefensible nature of the increases made. Simply and solely, the requests for further charges by the railway companies of late have been based upon the assertion that they need the money. They cannot be based logically upon a claim that the increased operating costs make them necessary; for, if the railways were well managed, they would be able to earn good dividends at present tariffs, as the Canadian Pacific Railway is doing. An example of the nature of the increases is the new minimum schedule of weights on shipments of lumber, which are given in detail elsewhere in this issue. Minimums are established which are considerably beyond the capacity of the cars in a number of cases. The advances mean simply an arbitrary tax upon the shipping public for services that are not rendered. Take also the increased stop-over charges that are now proposed. The new tariff for stop-over privilege is 1 cent per hundred pounds (the old rate), with a minimum of $5 per car. Even with the increases in the minimum weights of cars, a $5 minimum on stop-over will involve a tax of from 50c to $1.50 per car in a great many cases, for which the company has performed no service. Take, for instance, a car on which the new minimum is 45,000 pounds. Under the old stop-over tariff the charge would be $4.50, yet it must be $5 under the new tariff. Where the minimum is 40,000 pounds the unearned tax on the same basis amounts to one dollar. Such exactions cannot be defended.

The 15 per cent. increase in freight rates, for which the railway companies are asking, is on much the same footing as the rest of the increases. Possibly some people will feel that this is to a certain extent justified, in order to save the railway companies from further losses. If an extensive increase is found to be necessary, however, it should

not be a flat rate increase on all traffic, but should be graded according to the circumstances of each particular case. There is no justice, for instance, in putting a 15 per cent. increase on the charge for a long haul and a 15 per cent. increase on a charge for a short haul. The effect would be to create in some cases a barrier against trade in some of the commodities that are subject to the long haul.

One of the readers of the Canada Lumberman suggests that lumbermen should write to Sir Henry Drayton, expressing their objections to the frequent increases which the railway companies are obtaining. The matter cannot be brought to the attention of the Dominion Board of Railway Commissioners too strongly, and a large number of letters to Sir Henry Drayton, the Chief Commissioner, would bring the matter to his attention forcibly. Lumbermen have been getting a pretty heavy deal from the Railway Commission of late, and should start something effective in the way of protest if they wish to confine the increased railway charges within reasonable bounds. Personal letters will, perhaps, have a good effect, but the most effective means that could be adopted would be the holding of a convention of representatives of all the lumbermen's associations in Canada to discuss the matter in detail and to draw up a vigorous presentation of their side of the case, to be laid officially before the board at the earliest possible moment.

It is interesting to note that, according to the opinion of Mr. Gordon Waldron, representing the United Farmers, in their protest before the Dominion Board of Railway Commissioners, an increase of 15 per cent. in freight and passenger rates and a 15 cent per ton increase on commercial coal, would provide an additional revenue to the railways of $39,000,000. Of this amount the Canadian Pacific Railway would get more than $18,500,000, the Canadian Northern Railway $5,321,000, and the Grand Trunk Railway $5,873,356.

Ontario Retailers Ready to Organize

Retail lumbermen in Ontario are taking keenly to the proposal for the formation of local retail lumbermen's associations to represent the various sections of the province, and a central association, with headquarters at Toronto, to look after the mutual interests of the local associations. The agitation for this move had its origin with the Southwestern Ontario Retail Lumbermen's Association a short time ago. At their meeting early in May they appointed a committee, with instructions to act in whatever manner they thought best to induce the retailers in other parts of the province to organize along the lines suggested. This committee has lost no time in getting to work. First of all it enlisted the sympathies of some of the Toronto retailers who have been communicating with retailers in all parts of the province, laying the plan before them and asking for their co-operation. Many replies have been received, all of them being favorable to the proposal. Since the idea was first mooted, a few months ago, it has taken quite definite shape. Discussion has revealed the fact that the plan for local associations and a central one is the only feasible method of handling the situation. Other Ontario associations which were formed in the past were short-lived, largely because they covered too wide a field and were not able to work out definite plans that would be of interest to all the members. By forming local associations this difficulty will be overcome, and by having a central association operated in conjunction with the various local associations it will be possible to take care of many important mutual problems that are too big for the local associations to handle.

That the plan is making good progress is shown by the fact that the retailers in Toronto and Hamilton have given it hearty support. No steps have yet been taken in either of these cities to organize, but the retailers in both places are working out their ideas, and within the nxt few weeks will probably have matters in shape for calling preliminary meetings and forming organizations of the retailers in the districts of which they are the natural centres. In Northern Ontario many of the prominent retailers have expressed their approval of the idea, and their desire is to see it put into effect without delay. In Eastern Ontario the retailers are equally keen to see an association organized and to have it represented in a central association. Retailers in Ottawa, Kingston, Brockville, and other places have given the movement their support, and intend to hold a meeting at an early date.

When the various sections have been organized and have appointed representatives to a central association the work will be well under way, and the testing time of the plan will have arrived. No amount of organization will ever be effective unless it has not only the support of a large membership, but also the individual assistance of all the members in developing its many lines of activity. A retail lumbermen's association can do a great many things for its members that are of practical value. In the first place, it can handle those more or less local matters that formerly were considered to be the chief duties of such an association. In addition to these it can work out plans for the improvement of trade methods and conditions, plans which were not even thought of a few years ago. The progress of the association movement of late has been based almost entirely upon these new services. Some of the chief lines of service are in connection with advertising, plan books, insurance, credit information, etc. It would take a great deal of space to explain these in detail. When the retailers get together it will be easy enough for them to obtain full information as to the working out of these services from the successful associations which are already in operation both in the United States and in Western Canada. Briefly, some of them may be outlined. In the matter of advertising, for instance, an association can be of great value. To many a retailer advertising is a very difficult problem; yet an association, by its wide connections and the combined experiences of its members can work out advertising copy and methods which can be counted upon to give the best results—much better results than many of them ever thought to be possible. This is being done by other associations, and is one of their best service features.

The plan book service, inaugurated by most of the large and successful retail associations already in existence, is a great feature of their work. These books are furnished to members who keep them in their offices and are enabled in this way to show to their customers plans of any kind of a building that they wish to construct, together with details of the materials required and the costs. In a great many cases these books convert a curious enquirer into a customer, and they appeal so strongly to the customer that he may be counted upon to purchase lumber more freely than he would if he had to find out most of these details for himself.

Some retail associations have been operating insurance departments for a number of years, and have enabled their members to obtain good, safe insurance at a mere fraction of the cost which they had to pay when only the old line companies were available.

Good credit information is vital to the success of any retail dealer. Credits are the rock upon which many a good retail business has been broken up. There is no way in which such information can be obtained so easily and so thoroughly as by co-operation among dealers. This has been demonstrated clearly by those associations which have already been organized. It is a natural development for the retail association to form a credit information exchange, and, once it is formed, it repays to its members many times over the cost of membership, to say nothing of relieving them of the anxieties connected with trade when one has only his own experience to guide him.

Legislative matters sometimes affect the trade very closely, and the individual is helpless if he desires reform, or wishes to prevent changes which are to his detriment. Organization is the only way in which this problem can be dealt with. Only by means of presenting a combined front is it possible to make the interests of the trade felt when new laws are being passed, or when revisions of existing laws are found to be necessary.

The systematizing of trade methods is a subject that could be discussed from now until the day of judgment and nothing achieved by individual effort; yet terms of credit, varieties of stock carried, delivery problems, labor difficulties, substitute competition, systematizing of cost accounting methods, and one hundred and one other pro-

blems of the retail business which are all full of difficulties for the individual, can be dealt with by an association effectively.

There is no argument, in short, that can be raised against the plan, and everything is in favor of it. It is encouraging to see the way in which the Ontario retailers are now taking hold of the matter, and we confidently expect that before long the whole plan will be in operation. We know, from the results obtained elsewhere, that the trade will be benefited extensively.

U. S. Lumbermen Showing Fine Patriotism

It is impossible to witness what the lumbermen of the United States are doing in the way of co-operating with their government to promote rapid preparations for the war without feeling admiration for the manner in which they have gone about the whole business, and, looking back upon certain events in Canada in connection with the shell box industry, a feeling steals over us that, much as Canada has done, possibly our friends to the south are in the way of doing much greater things. It would not, perhaps, be right to compare the efforts of the people of the United States in this direction with those of Canadians. When we entered the war we had little or no precedent to go upon in our various undertakings. We had to develop our own plans and methods of putting them into operation. Moreover, we had no idea whatever, and nothing to assist us in forming an idea, as to the probable duration and intensity of the struggle. In both these respects the people of the United States have the advantage of us; they know what they have to face, and they have all our mistakes and successes to guide them. Yet the enthusiasm and loyalty which is being shown by industry in general throughout the country are greater, perhaps, than we in Canada were prepared to see.

It is characteristic of that great organizing and pushing ability of the United States citizen which has made him famous throughout the world that, individually and as a nation, the people have been able to emerge from times of peace into the war, almost overnight, and to set in motion their vast human and material machinery in a manner which is confounding their critics, both at home and abroad; those who, previous to the war—the German nation included—were so fond of asserting that the co-operation of the people of the United States would mean little in the way of assistance to the Allies. We see the whole situation more clearly to-day. We see that the assistance of the United States will be a great determining factor in bringing about the end of the war, and those who are engaged in the lumber business in Canada now see that not the least important, or progressive, of the various elements contributing to the success of the efforts of the United States will be the patriotic work of the lumber manufacturers in the great producing districts of the South and the Pacific Coast.

Lumbermen of great experience in many parts of the United States promptly offered their assistance to the government, upon the outbreak of war, and this assistance has been utilized freely in drawing up schedules of the vast quantities of timber and lumber required, in determining the price for which it is to be purchased, and in systematizing production and delivery. Remarkable speed in delivery has been obtained already in connection with the furnishing of material for the construction of cantonments. Mills in the South and West are ready to furnish, almost immediately, as much material as the government's shipping board will require for the construction of wooden vessels; and in all these preparations for the furnishing of great quantities of material the outstanding feature seems to be the fact that the manufacturers are promptly undertaking to provide this stock at prices considerably below those for which the material could be disposed of in the open market.

Interesting figures are being made public regarding the quantity of material that the government will consume in shipbuilding, cantonment construction, and other work. During the next twelve months, for the purpose of national defence solely, the consumption is estimated at 2,000,000,000 feet, which strikes one as an enormous quantity of lumber and timber; yet this great amount is only one-twentieth of the annual lumber production of the country. The industry will be able to furnish it quickly and efficiently. No less than 140,000,000 is already upon order to be used in the construction of 100 wooden vessels. This order has been placed with the Southern Pine Emergency Bureau, and will be distributed among Southern mills, which are undertaking to furnish it at an average price of $35 a thousand feet at the mills. Training camps for the navy will use 200,000,000; aviation school cantonments, 120,000,000; boxes and crates for the army and navy, at least 200,000,000 feet, and so on. Quantities are being required which are so large as to make one realize something of the greatness of the task the United States undertook in entering the war, yet the outstanding feature of the whole thing is that these requirements, abnormal as they are, both as to quantity and to speed of delivery, are being taken care of as though they were regular features of the trade. The patriotism and efficiency of the lumbermen of the United States are being displayed in a marvellous manner, worthy of the greatness of the cause for which the country is fighting, and worthy of the best business and industrial traditions of the people

Canadian Portable Houses in France

During a discussion in the House of Commons recently, Sir Geo. E. Foster, Minister of Trade and Commerce, replying to a question about ready-built houses for France, said:—"The matter was brought to my attention, and I took it up with the department and had the woodworkers plan certain houses. After these plans were made it was thought better—and under my advice it was done—to send the plans to Paris to have them thoroughly looked into and vised, as it were, by governmental authority, acting either directly or through a committee. That was done, and we received modified plans from them for two or three different styles of what we would call shacks, to be used temporarily until more permanent buildings could be erected. In every case their plan called for a more elaborate and more costly building than we had planned. Our buildings would cost from $75 to $100, but with the improvements, coverings, and the like of that, suggested by the French authorities, they would cost considerably more. However, a number of houses were constructed and I got transport for them free of charge to Paris, where they were on exhibition in the Champs Elysees. I myself saw them when I was over there last summer. They had the name of Canada on them, and served to show not only our plan of construction for temporary buildings of this kind, but our materials as well, and they were seen by a great many people. But the war has gone on much longer than anybody thought it would, and although we know now what they want and though the plans are in the hands of the woodworkers of Canada, not much is being done at present. They, too, I suppose, are awaiting the proper time. What works directly against them is the absolute impossibility of getting transport for goods."

U. S. Lumbermen Adopt War Orphans

Memphis lumbermen have adopted 100 war orphans of France by subscribing $7,300 for their upkeep for a period of two years. France has 200,000 or more orphans whose fathers have fallen in battle. The French Government allows 10 cents per day for the support of each destitute child. This is not enough, and the Fatherless Children of France Society is seeking to raise an additional 10 cents for the support of each child. This will enable each orphan to remain sheltered in its own home and still have ample nourishment and opportunity for education and physical growth.

Canadian Railways Seek Many Advances

Minimum Weights on Lumber Increased—Fifteen Per Cent. Freight Rate Advance Wanted—Stop-off Charge Increase Made

The Canadian railways have put into effect a tariff increasing minimum weights on lumber shipments. The new minimums are set forth in C. P. R. Tariff E, 2886, effective May 21st. Compared with the minimums formerly in effect they are as follows:—

	New Minimum Weight Pounds	Old Minimum Weight Pounds
Under 35 feet long inside or platform measurement for clapboards, flooring, shingles, lath and dressed lumber	34,000	30,000
Except when cars loaded to full capacity will not contain this minimum, actual weight, but not less than	30,000	
Cars 35 feet, and not over 36 feet 6 inches, inside measurement, for box, stock and gondola, or 36 feet 10 inches platform measurement for flat cars, boards, flooring, shingles, lath and dressed lumber	40,000	34,000
Except when cars loaded to full capacity will not contain this minimum, actual weight, but not less than	35,000	
For cars of all kinds under 35 feet in length inside or platform measurement for lumber (except dressed lumber) and other forest products	40,000	30,000
Except when cars loaded to full capacity will not contain this minimum, actual weight, but not less than	35,000	
For cars of all kinds 35 feet and not over 36 feet 6 inches inside measurement for box stock and gondola, or 36 feet 10 inches platform measurement, for box stock and gondola, or 36 feet 10 inches platform measurement, for flat cars, lumber (except dressed lumber) and other forest products	45,000	34,000
Except when cars loaded to full capacity will not contain this minimum, actual weight, but not less than	40,000	
When box, stock or gondola cars of greater length than 36 feet 6 inches are used, the minimum weight for a car of that length will be increased 5 per cent. per foot, or part thereof. When flat cars of greater length than 36 feet 10 inches are used the weight for a car of that length will be increased 5 per cent. up to 37 feet 6 inches, and an additional 5 per cent. for each foot or part thereof over 37 feet 6 inches.		

It is expected that the lumbermen will appeal to the Dominion Board of Railway Commissioners against the increases.

Increased Minimums Not Justified

Montreal, June 23.

Editor Canada Lumberman:

I find that very few of the lumbermen are aware of the fact that the railroad companies have increased the minimum weights on carloads of lumber—on cars under 35 ft. from 30,000 pounds to 35,000 pounds, and 35 ft. to 36 ft. 6 in. cars from 34,000 to 40,000 pounds.

Down our way most of the spruce lumber is sawn 12 and 13 ft. lengths and piled 10/13 ft. We find it is impossible to load dry spruce in 35 ft. and 36 ft. cars to a minimum of 40,000 pounds.

We think that the railroad companies are certainly getting enough increase without making the lumber shippers pay for something they do not get.

It is the writer's idea that it would be a splendid plan if your paper would suggest that the lumber dealers write to Sir Henry Drayton about this matter. It seems to me that the railroads are continually asking for increases, and, when the war is over, our Canadian lumbermen are going to have a hard time to sell their lumber under such handicaps as the railroads are placing on the shippers.

Campbell, MacLaurin Lumber Company, Ltd.

Railways Increasing Cost of Stop-over Privilege

Supplements to railway tariffs have been issued, effective July 13, making changes in the arrangements for stop-off for dressing, re-sawing, or sorting and reshipment of lumber (Canadian traffic). The minimum stop-off charge has been made $5 per car. The revised rules will read as follows (C.P.R. tariff example):

Shipments of rough lumber, carloads, for dressing, re-sawing or sorting and reshipment, within thirty days (except as shown in Rule 1) after arrival at stop-off point; and moving between stations on the C.P.R. in Canada, Fort William, Ont., and east, may be given the benefit of the through rate, original shipping point to final destination (provided stop-off point is on direct run), plus 1 cent per 100 pounds, minimum $5 per car for each stop-off, under the following conditions:

The stop-off privilege will apply only to straight carloads of hardwood or straight carloads of softwood, not on mixed carloads of hardwood and softwood, both into and out from stop-off point. It is not permissible to forward from stop-off point on through rate from point of origin other than the same kind of lumber received. Softwood lumber must not be substituted for hardwood, shingles for lumber, or vice versa, nor can one kind of softwood be substituted for another, or one kind of hardwood for another, for example: pine for spruce, oak for maple, pine for oak or maple, etc. Neither is it permissible to substitute Canadian lumber for United States lumber or vice versa. Where there is any substitution of lumber current tariff rate will apply from stop-off point.

Shipping bills and paid freight receipts must, in all cases, both in movement from point of shipment to stop-off point and on outward movement to final destination, distinctly indicate the kind of lumber, i.e., birch, pine, spruce, etc.; also on outwards movement from stop-off point show the process through which it has been put.

Proposed Freight Rate Increases

The Dominion Board of Railway Commissioners held a sitting at Montreal on June 20, at which the application of the railway companies for additions to existing freight rates was further considered. The chief part of the discussion related to the application for an increase of 15 cents per ton on coal.

Mr. W. S. Tilston, of the Montreal Board of Trade Transportation Bureau, read a letter written by Mr. G. Hadrill, secretary of the Board of Trade (which was concurred in by the lumbermen's section), stating that the council of the board, "recognizing the need of an improved service and the need of the railway companies for financial assistance to enable them to provide the necessary equipment and additional facilities, as well as to cover the increased costs of labor, coal, and supplies, will not oppose the application of the railway companies for a general advance on existing tariffs covering freight and passenger tolls, except with regard to the following conditions:

"1. That the amount of the increase shall be such as the Board of Railway Commissioners is convinced from evidence submitted is necessary under present abnormal conditions, but that it shall not exceed 15 per cent.

"2. That such increases do not apply to terminal rates, charges, and allowances, or absorptions and rates and charges for demurrage, weighing, switching, car service, transfer, diversions, reconsignment, refrigeration, icing, storage, elevation, and other transit or special services.

"3. That, owing to the general hardship involved by the current high prices, no advance be made as applying to coal and coke, and that consideration be given as to the wisdom of applying advances to low-grade commodities, such as crushed stone, sand, clay, and gravel, etc.

"4. That the advance be distinctly regarded as a measure of emergency, and therefore, that any advance that may be granted shall apply for a period of one year only, when any extension of that period which might then be asked for by the railway companies could, if conditions warrant it, be considered by the Board of Railway Commissioners.

"I am to add that the council is of opinion that in the case of contracts entered into by shippers prior to the notice of application by the railway companies for an advance in their rates, in event of your board granting any advance, consideration should be given to such contracts."

The consideration of the proposed revised demurrage rate was postponed until the sitting in Ottawa, on July 5, when a conference of the various interests will be held, at which an endeavor will be made to arrange rates with the railway companies.

B. C. Lumbermen Protest Againt Higher Freights

Protest was recently made before the Dominion Board of Railway Commissioners at a meeting in Vancouver against the proposed increase of 15 per cent. in freight rates upon Canadian railways. It was pointed out that the lumber and shingle manufacturers already have a special commodity rate, and that they, therefore, are not interested in the classification, but they objected because their products, not being of a perishable nature, were often sidetracked for other goods. The chairman of the board remarked that Coast lumbermen were not eager for business, and referred to a large order from the prairies that had been turned down by a large mill. If the railways were allowed to increase their rates, the board was asked to give the mill men time to deliver their orders, about four months, before the order became effective.

Lieut.-Col. Sir William Price, of Quebec, has returned to Canada from the front, on sick leave.

Campbell, MacLaurin Co. Appoint New Representatives

Fred W. Sage, Hamilton, Ont.

Frank L. Reed, Sarnia, Ont.

The accompanying portraits represent Mr. Fred W. Sage, Hamilton, and Mr. Frank L. Reed, Sarnia, Ont., who have recently been added to the sales force of the Campbell, MacLaurin Lumber Company, Ltd., Board of Trade Building, Montreal. Mr. Fred W. Sage will represent the firm in Eastern Ontario, and Northern New York State. Mr. Sage was born in Hamilton, Ont., and educated there in the public and high schools. He learned the lumber business with the M. Brennen & Sons Manufacturing Company, Ltd., for whom he has been acting as salesman and buyer during the past eight years.

Mr. Frank L. Reed will represent the Campbell, MacLaurin Lumber Company, Ltd., in Western Ontario and Detroit. Mr. Reed was born at Clyde, Ohio, and at the age of 6 moved with his parents to Watford, Ont., where he was educated in the public and high schools. For ten years Mr. Reed was employed by the late H. P. Lawrence, of Watford, as foreman in his retail lumber yard. Subsequently he moved to Sarnia and became engaged in the wholesale business, occupying the position of foreman for seven years with Mr. E. A. Lebel and the LeBel, Turnbull Lumber Company. During the past three years Mr. Reed was engaged by the Spanish River Lumber Company as their Western Ontario salesman.

By the engagement of these two experienced salesmen the Campbell, MacLaurin Lumber Company, Ltd., have rounded out a thorough organization for handling their extensive trade in Eastern Canada and the Northern States. In New York City they are represented by Mr. Maurice H. Gatchel, and Mr. James Yelland covers the Province of Quebec.

Rainy River Pulp and Lumber Co. Start

The Rainy River Pulp and Paper Company, whose mill is at Port Mellon, Howe Sound, has commenced the production of kraft pulp. E. L. Mohn, vice-president and treasurer, who is also filling the position of managing director of the company, reports that the opening day's running of the first of the four units to be installed has surpassed all expectations in regard to smoothness of its operation and quality of kraft pulp produced. This company is the first of its kind on the Pacific Coast, and marks the commencement of new, and what promises to be an extensive, industry for this section of the Dominion, which has hitherto been confined to the eastern provinces of Canada. The plant has been changed from a soda paper mill to a kraft pulp and paper plant, and that accomplished in record time. The plant was purchased by the Rainy River Pulp and Paper Company from the previous owners on February 1, 1917. In less than four months the company has effected an efficient and capable organization headed by James Beveridge, who is in full charge of the plant. The plant is thoroughly equipped for the production of kraft pulp as well as the finished paper. Under the Pulp Act of the British Columbia Government the company is assured, at a very nominal tax, ample supply of pulp wood for thirty years' operation. Mr. Mohn states that plans for the second unit have been made, and that work will start immediately upon its installation, which will double the present capacity. The company's officers include Robert Sweeney, of New York City, who is the president and original organizer of the company, and J. C. McCrary, secretary of the company. Mr. McCrary is also general sales manager.

Mr. William Rutherford, the new chairman of the Montreal branch of the Canadian Manufacturers' Association, was among the members attending the annual convention of the association at Winnipeg.

National Hardwood Changes Adopted

New Grade of Selects Meets with Approval at Annual Meeting—John M. Woods Again President

The National Hardwood Lumber Association held its twentieth annual meeting at Chicago on June 14 and 15. The most important matter dealt with was the adoption of a number of changes in the inspection rules. These changes have already been published in the Canada Lumberman. They include the adoption of a grade of selects which will eliminate the undue spread that has formerly existed between grades of No. 1 common and firsts and seconds. It will also result in more efficient and satisfactory grading and sale of hardwood lumber in relation to the uses for which it is intended.

Briefly, the intermediate grade, which is to be known as "selects," is to include boards which will grade not below seconds on the best face and not below No. 1 common on the reverse side, and will admit other boards of equal value. It was the general belief of those present at the meeting that the new rule was practicable and workable. Other changes were introduced in regard to cypress rules, wagon box boards, bending oak, and oak construction material. All the rules were adopted without opposition, with the exception of that in relation to cypress, and in this case the majority was overwhelming.

It was decided that the changes adopted should become effective on September 1, 1917, and that the additions should be immediately printed as a supplement to the present book of grading rules and be put into effect immediately, with the exception that the inspection department should be instructed not to enforce them in the inspection of shipments made by any members having contracts made on the existing rules before June 15 who should make shipments before January 1, 1918.

The meeting was devoted far more than usual to an exchange of views between members in regard to trade conditions. It was quite noticeable that the industrial situation brought about by the entry of the United States into the war was the subject uppermost in the minds of all the members present. In former years the annual meetings have been devoted mostly to discussion of proposed changes in the inspection rules and other subjects of similar importance which were brought up for definite decision by a vote of the members. This year, although extremely radical changes were made in the inspection rules, there was, comparatively speaking, very little discussion about changes. The amended rules presented by the inspection rules committee were adopted with very little discussion.

Excellent reports were presented by the president, Mr. John M. Woods, and the secretary, Mr. F. F. Fish.

The election of officers resulted in Mr. John M. Woods being again selected as president. Mr. J. V. Stimson was elected first vice-president, John W. Dickson second vice-president, and C. A. Goodman third vice-president. The following directors were elected to serve three years:

C. H. Barnaby, T. A. Washington, Edward Buckley, W. E. Chamberlain, W. J. Hetherington, George W. Morgan, M. J. Quinlan, and W. H. Russe.

On the suggestion of the president, the association decided in favor of appointing a legislative committee. On the proposal of the secretary, it was decided to take steps to discipline members who do not abide by the official inspection of the association.

English Spruce Situation Unchanged

The Timber Trades Journal, of London, Eng., in its issue of June 9th, says: "There is unfortunately still very little to say about the spruce market. Some importers are hoping to see the facilities which are granted to the Scandinavian extended to the American, or at least to the Canadian trade, especially in view of the many important uses to which spruce is now put. We fear the wish is father to the thought. The circumstances are very different. It would, for instance, be difficult for a prospective importer of goods from America to make the statement that "the proposed parcel will not displace foodstuffs or munitions." In regard to Scandinavian imports of wood, the presumption is that this question can be safely answered in the affirmative, for both Norway and Sweden are themselves suffering very severely from a want of food; but with respect to America, the presumption is the other way. Small lots of spruce in liners find their way over from time to time, particularly to the Mersey, and they are quickly snapped up for immediate consumption; but as to the great bulk of the shipments, these will in all probability be taken by the French and British Governments."

At a recent meeting of the Toronto Board of Education a communication from Mr. L. B. Beale, of the B. C. Forest Branch, was read, offering to present a car of British Columbia lumber for use in the woodworking classes of the Toronto Technical School. The offer was gladly accepted.

Ontario Retail Association Assured

Prominent Firms in All Parts of the Province Supporting the Proposal— Organization Meetings Being Arranged

Much progress is being made in the movement for the formation of local retail lumbermen's associations in Ontario, together with a central association to look after the mutual interests of the local organizations. Toronto, Hamilton, Ottawa and Northern Ontario retailers are taking the matter up and working earnestly, and the prospects are excellent for the accomplishment of definite results at an early date. A strong circular letter, sent out recently by Mr. Walter C. Laidlaw, of the R. Laidlaw Lumber Company, Limited, Toronto, to many Ontario retailers, has aided the movement greatly. Mr. Laidlaw's circular was as follows:—

Circular Sent to Ontario Retailers

The retail lumber dealers in Southwestern Ontario between London and Windsor have an association, as you are no doubt aware, and at their last meeting appointed a committee to consider the organization of the rest of the province. It has been suggested that district groups might be formed each with their own officers and committees, who would then form a provincial association with one paid secretary acting for all and co-ordinating the work.

The proposed groups are as follows:—

(1) Southern Ontario—Windsor to London—Windsor.
(2) Western Ontario—Ingersoll to Hamilton—Hamilton.
(3) Central Ontario—Burlington to Belleville—Toronto.
(4) Eastern Ontario—Napanee to Pembroke—Ottawa
(5) Northern Ontario—Mattawa to Sault Ste. Marie—Sudbury.

Briefly, the objects of the association would be:—

(a) To promote the general welfare of the retail lumber dealers.
(b) To collect and distribute information concerning the proper use of wood and the general state of the lumber industry.
(c) To correct business abuses in the lumber industry.
(d) To promote uniformity in the customs and usages of the lumber trade in Ontario.

The enclosed memorandum of some things being done by a retail association in the United States will give an idea of the line of work.

There will be no rules or regulations that in any way shape or manner infringe upon each man's right to conduct his business as he sees fit.

The annual membership dues will be determined by your committee after organization, and will probably be from $10 to $15.

You are invited to sign and return the enclosed application form. When a reasonable number of applications for membership are received, a meeting will be called in each district for the election of officers and committees.

What Other Associationns Are Doing

The memorandum referred to above was as follows:—

During a recent month one association carried on the following work:—

1. Advised its members of matters of interest relating to the following:—
   (a) Lien law.
   (b) Building code and local by-laws.
   (c) Freights, demurrage, etc.
   (d) Terms of sale.
   (e) "'Buy a Home Campaign."
   (f) Advertising copy for local papers.
   (g) Pushing the sale of certain lines of lumber; e.g., silos, implement sheds, cedar chests, etc.
2. Secured important amendment to the lien law.
3. Arranged district and county meetings of retail lumber dealers for the study of local problems and a better knowledge of local conditions.
4. Assembled valuable information in regard to the expenses of doing business as proved by experience in order to make it available for each member. The importance of an accurate knowledge of costs is obvious. Clear thinking, the intelligent application of principles and close co-operation with each other will build sound and successful business.
5. Advised members in regard to certain fraudulent concerns who had sent out circular letters to the retail lumber trade.
6. Secured credit information in regard to contractors and builders who moved from one town to another, and gave their past record and history to the lumber yards in the new town.
7. Induced a certain manufacturer to ship an old order at original price after he had arbitrarily cancelled it and refused to ship. The result to this member in dollars and cents would pay his association dues for a good many years.
8. The Grading Committee conferred with the Southern Pine Association on grading rules and succeeded in modifying a number of arbitrary changes proposed by the manufacturers. Uniformity of grading secured. Transit cars discouraged and legislation promoted to prevent it.
9. Arranged that their members be furnished by the manufacturers with advertising matter, plans, specifications, etc., to create a better demand for lumber.
10. Furnished their members with comparative figures on the increased prices of iron, wheat, paper, glass, glue and other commodities in contrast to lumber.
11. Interviewed the Railway Commission to lift the embargoes on lumber and to secure better car supply from the railroads for lumber.
12. Furnished their members with a classified directory of manufacturers and wholesalers furnishing the various items of stock handled by retail lumber yards.

N.B.—DON'T YOU THINK IT IS TIME THAT THE ONTARIO RETAIL LUMBER DEALERS HAD A SIMILAR ORGANIZATION?

A Hard Problem for the Retailers

Retail Lumber dealers have many problems of a difficult nature to deal with, and one of the most troublesome arises in connection with obtaining money for stock delivered on a building job, where the owner issues cheques on progress certificates made out by the architect. Without some hard and fast agreement between the owner and the architect or the supply firms the way is open for the contractor to divert these cheques to his own use and to leave the lumber dealer out in the cold. Toronto retailers have recently sought to interest the architects in this matter and have them insert a clause in their agreement with the owner to the effect that payments on progress certificates shall be made out not to the contractor, but to the supply firms. So far nothing has been accomplished along this line.

In Minneapolis, Minn., a partial solution of this difficulty has been reached. The Credit Department of the Builders' Exchange of Minneapolis sends the following form letter to every owner who takes out a building permit:

Dear Sir,—In accordance with the policy of the Builders' Exchange, to work in every way for the betterment of building conditions in the city of Minneapolis, the Credit Department of the Exchange has instituted a new feature of the work, having in mind the interests both of its own members and those of the general public as well.

This feature consists of calling the attention of prospective builders to the necessity of taking proper precautions to see that all bills for labor and material are paid, not only on completion of the job, but as the work progresses and as money is being advanced.

The material man has no desire to file liens for his accounts, but is frequently obliged to do so on account of the carelessness of the owner and the unreliability of certain contractors.

The natural inclination to accept the lowest bid, regardless of the financial responsibility of the contractor, often leads to trouble and additional expense to the owner.

There will be no danger of the owner having to pay bills twice if he will use ordinary caution and judgment.

Insist on the contractor furnishing receipts for labor and material as the work progresses, and especially before the final payments.

Yours very truly,

Building Material Credit Association.

In actual practice it is found that this piece of advice given to the owners puts them on their guard, and the amount of trouble from this cause is greatly reduced.

Good Demand for Thick Stock

The Union Lumber Company, Toronto, recently discharged two vessel loads of lumber at Wiarton, Ont. Part of this stock is being exported to South Africa and the balance is for local consumption. This is thick stock that had been cut for the British market, but, as space could not be had for shipments across the Atlantic, the company decided to dispose of it elsewhere, and have been able to do so to good advantage. Much of the stock will go to box factories, where it will be resawn for box purposes. The same company have recently shipped a vessel load to Tonawanda, the shipment containing 800,000 feet of thick Norway.

Canadian Foresters in France

Group of Canadian Forestry officers in France—Capt. G. T. Reid on the right.

The accompanying illustration is a reproduction of a photograph taken in France, not far behind the firing line. It shows the officers of the 20th Company of the 247th Forestry Battalion, raised in Canada, now operating in France. This battalion was raised in 1916, and one of the officers shown is Captain G. T. Reid, who was in charge of the raising of the Toronto section of the battalion. Captain Reid is shown standing at the right of the picture, and lumbermen will readily conclude that the life in France is agreeing with him. Captain Reid is a son of Mr. J. B. Reid, the well-known retail lumber dealer of Toronto. The battalion went overseas in November, 1916, and was immediately sent to France, where it has been operating in the forests ever since its arrival.

With the Canadians in the Trenches in France

Visualize if you please an up-standing, clean cut, sun-browned American boy-man dressed in the uniform of the Navy. Let the shoulders be broad, the figure rather thin yet giving promise of future development, hands well shaped and with that surety of grip and manner of handling objects seen in first class mechanics such as saw filers. Such is Guy C. Worcester, now at the Naval Training Station, Chicago, and formerly a member of one of the Canadian field artillery regiments. He spent fourteen months in the trenches in France, an extremely interesting account of which he gave to the members of the Western Society of Engineers recently. The man part of him was plainly evident in the grimness with which he spoke of many things; the boy in the smile with which he told of dancing at a French chateau when off duty while the guns of the battery fired at the Germans through holes knocked in the foundation of the building. He enlisted when aged 17, in the first summer of the war. Some of the things that he told of follow, although the language is not exactly his:

The land that the Canadians hold is just a sea of mud and water In peace time the country is drained by canals and ditches, but now trenches run everywhere and stop the drainage. The boys are all in mud from their knees to their waists most of the time, and this soaking all the time gives them trench feet. The feet and legs swell up and it feels like rheumatism and it takes about six months to get over it. The only way we got dry was to sleep in our clothes; it was then nice and warm in the morning, but we had to get right out in the stuff again so it didn't do much good. The commanders tried a lot of remedies. One thing they sent out was a sort of grease to rub on our feet and legs three times a day. We tried it about one day, but as we couldn't wash any and it stuck—well, we didn't use it any more. We called it anti-frost bite and it was fine for cooking and lights at night. You'd tear off a piece of the top of a sock and dip it in a can and it would burn just like a lamp and you could cook over it fine. So the boys all hollered for more and more anti-frost bite and the commanders back behind were awfully pleased, saying: "It must be doing a lot of good the way the boys are using it."

The worst things of all are the rats. They are everywhere. They are sort of water rats and just can move about on land—the size of big cats they are—very fat and sleek and have increased in number since the beginning of war tenfold at least. You can't look any place at any time of the day or night without seeing a rat, a big, fat rat, about the size of a cat. They have more than they can eat, you see. They don't mind the soldiers a bit; they have become accustomed to them being everywhere. As soon as the light is blown out at night the rats come out of the holes between the sandbags and begin to crawl all over you sniffing. A fellow don't mind it so much until they begin to sniff at his face—it is such a loud sniff, like that of a dog.

When things get a little dull and there's nothing much doing the boys organize Fritz hunting parties You don't have to go; they are all volunteers. I went on one about a week after I got to the trenches. I guess that's probably why I went. I didn't want to miss any excitement—then. Our trenches were just 90 yards from the Germans. It's mighty particular work—Fritz hunting. You go out of your trench at a certain place and you have to be back at just a certain minute or the guard can't tell which side you belong to. Where the guard can't tell they shoot, and tell afterwards.

Well, we went out at about 10 o'clock with big Pierre LeBrun in the lead. Pierre is a big French Canadian as strong as three men and is a reformed Michigan Central fireman. He is the cock of the walk and never does any work except go Fritz hunting. Before I went I sort of envied him. Afterward I didn't. We laid down flat and squirmed ahead inches at a time. We couldn't make a sound, for that would mean fire from both sides. When we came to our wire entanglements we dug under. The ground was fine digging; you could scoop it out easily and then the hole would fill up with water. You would then have to swim or crawl through.

A raiding party always tries to bring back two or three Fritzes so that the officers can ask them questions. You go through the trenches and try to find some intelligent looking ones, for you know if you lose four or five men and kill six or seven Fritzes and then get back with two or three prisoners that don't know anything it is not much use in going. After about three hours we got to the German trench and we could hear the sentry walking back and forth. Pierre got out his Fritz tool—it is the wooden handle of a trenching tool fitted with a cogged burr on the end, and when you hit a man with it he don't say anything—and it took him a half hour to edge along until he got a crack at the sentry. Then we went in and got a couple and brought them back—and, say, they were sure glad to come. They lit out first and were the first ones back to our trench.

The guns used in the English army now are short ones. I should say about a yard long and just about buried in wood. All the metal that sticks out is around the breech and block and where the muzzle shows. The gun is two or three inches broad. This is to keep out dirt, mud and water as much as possible..

I was in London on the night of September 5, 1916, when an English aviator brought down a Zeppelin. I saw it fall, and in burning it lit up almost the entire city. Next day I got out to the ruins. Soldiers had rolled all that was left of the shell up into a roll about breast high and 600 feet long Of course, I couldn't tell just what it was made of, but from what I saw and was told it is evident that the Germans are getting short of aluminum and are using more and more wood and such material in building them. There was a lot of wood used in this one.

When I got home I thought I would work a while, but I guess this soldiering got the best of me, for I took on with the Navy in April.

Following this talk the raising of the regiments of engineers was commented upon and it developed that lumbermen are wanted in practically all of the regiments. Men who know how to handle an axe, how to pull a crosscut saw through trees and timbers, how to build bridges and repair them are wanted. A great deal of wood is used by the armies in the field and enough lumbermen are wanted in the engineering regiments to enable them to act as units of lumbermen if necessary.—American Lumberman.

Rifle Stocks Use Up Large Lumber Supplies

The New England Westinghouse Company, Meridian, Conn., which has a contract for 1,000,000 rifles awarded by the Russian Government, on which it has been working for more than a year, is now producing 500 weapons daily with 1,600 hands employed. The company is now increasing its output rapidly and expects soon to be turning out 1,000 rifles daily. The present consumption of hardwood lumber for stocks alone is approximately 3,500 feet daily, or about a carload of lumber weekly. In addition to this, a considerable quantity of good quality box shooks is required for packing the finished rifles. Specifications for the rifle stock lumber call for thoroughly kiln dried wood, clear of all imperfections, delivered in planks 4 ft. long, 3 ins. thick and 7 ins. wide, it is stated, but since the company has now developed a fully equipped woodworking shop of its own, with very efficient dry kilns especially designed for this purpose, the former specifications may be modified. It is understood, however, that the preference will be given to high grade, heart birch wood.

Pte. Chas. M. Cane Wounded

Last year Pte. Chas. M. Cane was on the casualty list as shell shocked, and now he is again reported as wounded in the right arm from gunshot and in King George's Hospital, London. He is a son of Mr. J. G. Cane, wholesale lumber dealer, Toronto. He was employed at Eaton's before going overseas. He is only 19 years of age and has a brother, Lieut. James Cane, who has been to the front and returned suffering from shell shock some time ago.

The Selection of Lumber Salesmen

Education, Knowledge of Lumber Products and Substitutes, and Enthusiam, all Essential

By Wm. Beebe*

The subject, "Selecting Lumber Salesmen," is one which in a general way could be covered by the same rules as the selection of a salesman for any other line of endeavor, for indeed lumber salesmen must have the same qualities in every way that apply to salesmen representing other commodities, about which there has been so much written. Hence it does not seem necessary to consume any time in discussing this, for selling is a proposition which is very much the same no matter whether one is selling lumber from a retail yard, selling lumber on the road as a traveling salesman to the retail trade, or whether one may be selling bank loans, Liberty Bonds, medical advice, or whether you call your customer a client, as do the lawyers. So I am not going to cover the ground which has been or will be covered, regarding salesmanship in general, except to say that the natural qualifications of any salesman are born ability, good health, honesty, ambition, and a pleasing personality, all of which are subject to development and may be attained to an extent, at least, by training, hard work and experience.

In the selection of a lumber salesman, it is my idea first to investigate and find out if the man has the necessary general qualifications, or the ability to acquire enough of the general qualifications necessary for the selling of any product. Thus my talk must necessarily be based on what a lumber salesman must know to be successful, and as I am here at the request of the Southern Pine Association, and my work is connected with that line of industry, my remarks will particularly refer to the selecting of lumber salesmen to sell yellow pine.

We have attempted for a number of years, rather than go out and forage on our competitors for salesmen, to educate them along the lines that would make them most valuable, and I take it you will be more interested in knowing what, in our opinion, a lumber salesman should know, and the qualifications we would look for were we selecting one; or, in other words, the acquired qualifications in addition to the natural qualifications already mentioned.

My first question to an applicant for a position as lumber salesman concerns his education. A graduate of a high school is much preferred to one who has only finished the ward school, and a college graduate is preferable to a high school graduate. A diploma from a school of forestry is one of the best recommendations a man could have if applying to me for a position as salesman, as the special and technical training given in these schools is invaluable. While a school of forestry does not aim to produce lumber salesmen in any way, but rather professional foresters, yet the field and laboratory work and the time put in at lumber producing mills may prove invaluable to a lumber salesman at any moment, as it all has to do with the harvesting, utilization, extension of markets, and consumption of timber. At these schools one learns much about the purpose for which certain woods are or are not fitted, their commercial importance, their diseases and cures, and the chemical treatment necessary or best to preserve against fire, fungi, or insects. While there are hundreds of successful salesmen, one would be much more valuable to his company and himself if he had a more technical and intimate knowledge of his product, as he would be constantly using it in an indirect manner.

So I say, education is the first thing to be considered in the selection of a lumber salesman, and the more education and special schooling the better salesman he is sure to be.

Knowledge of Product Essential

The next in importance is that a salesman should have knowledge of the merit of his product, and also its limitations. Wood as a building material has qualifications that have been known since the early days of civilization, as it has been available nearly everywhere, and for that reason it has become the universal material for shelter and protection of man and beast. It has the merit of being easy to handle and easy to work into implements with primitive tools, and with its lightness and strength, the ease with which it can be lifted and carried, the fact that it is stronger and will carry heavier weights, weight for weight, than iron or steel; that wooden buildings are the coolest in summer and the warmest in winter, on account of the wood being a non-conductor of heat or cold.

A lumber salesman should know just where his product can be used to better advantage than substitutes. He should know something of engineering records regarding the use of them, and should know all the talking points of his product as compared with substitutes that can be used in the same place. For instance, metal lath are almost universally used back of stucco in houses, and he should know that on account of rust they invariably fail within from eighteen months to seven or eight years.

The successful lumber salesman must know all materials that are being used for substitutes for his product; the merits, limitations and relative cost of them for certain purposes. He should have specific knowledge regarding certain purposes that lumber should or should not be used for, and he should see that dealers, architects and builders give careful consideration to the lumber best suited for specified purposes. This course will inspire confidence in the retailer and consumer, and is of particular benefit to the general industry. In fact. "Use Wood Where Wood Is Best," is a slogan that should not be lost sight of, and a good salesman knows where this is, and why. No salesman can be fully successful unless thoroughly acquainted with the grades of his product, and to know grades he must know about its growth.

Regarding growth, the salesman should know that the pine tree from the time the leaves start to grow in the spring, say in March or until the latter part of June, forms a porous, light colored kind of wood which is called "spring wood," and from about July to the end of the season's growth it forms a much denser growth which is flinty, more or less resinous, and is called "summer wood." It is this "summer wood" that gives strength value to pine wood, and the higher the percentage of "summer wood," the stronger the stick. This embraces what is known as the "density rule," and the dependability of this rule is established by the United States Department of Forestry. It has been adopted by the American Railway Engineering Association, Society of Architects, and various building code associations. The good salesman must know that the density rule is a measure of strength only, and has no reference to the durability.

Where durability is of the greatest importance, consideration must be given to the heart content of the material used, for heart lumber is less affected by fungus than sap wood, and therefore should be used in places where lumber is subject first to becoming wet and then dry. Lumber either always in water or always dry will never rot, but where subject to varying degrees of dampness it should better be all heart, or be chemically treated. The salesman should know something of the prevention of decay by chemical treatment. He should know, first, that what is commonly called blue sap stain is not a form of decay and does not in any way affect the strength of the stock, and he should also know that blue sap fungus never affects the heart wood. Yet this does not mean that the dozens of species of fungi which grow on sap wood will not destroy sap wood; they will often destroy the heart wood as well.

Prevention of Decay

The prevention of decay is a subject that is assuming large proportions, as in 1915 about 38,000,000 ties were treated in this country; also, about 3,000,000 square yards of paving blocks were treated, and the industry is just in its infancy as regards general use. A salesman should know the cost of this treatment; the necessary information as to where to use treated lumber, and the best treatment for certain places. In a few years this will be better understood than at present, and the salesman I would select must be ahead of the times.

Another very important matter that a salesman should be conversant with is creosoted or treated wood blocks for interior use. He should know that they are best in any place where heavy material is handled, such as railroad shops, freight houses, as well as barns, and there is no question of their being the best pavement for streets, for the following reasons: They are the most durable, most economically maintained, the least noisy, and the least injurious to horses of any pavement in existence. He should know that the streets that have the heaviest trucking in America are paved with creosoted blocks because experience shows them to be the best for the purpose. The salesman should also know about creosoted posts and poles, which are rapidly coming into general use, as well as treated material for the use of the farmer, which has been in general use in Europe for many years, but is just becoming known in the United States, largely on account of the cheapness of lumber.

A lumber salesman must necessarily know the grades of his product, as he must be able to tell the customer or builder the grade he should use for certain purposes. There are five distinct grades of timber to be dealt with: heart timbers, No. 1 common timbers, square edge and sound timbers, merchantable timbers, and select structural timbers, besides the numberless grades of car material and yard stock. He should know all about knots, pitch, wanes, checks and splits, and what is allowable in each grade and length of piece, as this information is invaluable and is used every day in many ways, as in adjusting grade claims and advising the use of the proper grade suited to all requirements.

A salesman must know how best to finish his wood so as to bring out the beauty of the grain, by staining, varnishing, enameling or painting interiors or exteriors

Another matter of importance for a salesman to know is concerning silos. He should know that wooden silos are superior to any other kind, for the reason that wood is a non-conductor, and the silage stays

* An address delivered at the World's Salesman Congress at Detroit.

sweeter with less loss in spoilt silage; that wooden silos are easier to repair, can be moved, and that the initial cost is less.

A salesman should know the talking points of so-called mill construction, which means a type of building constructed of wood to withstand fire as much as possible, built with large timbers of not less than 6 x 12 inches, with floors not less than three inches in thickness, and where the outside walls are of brick, the advantages of which are strength of floors and low rate of fire insurance, and a low cost of maintenance as compared with steel or concrete. He should know that a wooden beam will withstand fire better than an unprotected steel beam. He should know that there are very few cases of properly mill constructed buildings burning in the whole United States, while there are hundreds of cases of concrete buildings crumbling down under comparatively small blazes.

Knowledge of Sawmill Costs Essential

A salesman to be successful must know a great deal regarding sawmill costs, and particularly planing mill costs, as there is hardly a day when he is not called upon to quote on something special, so that a knowledge of the cost of ripping, resawing, trimming, special working of accumulations of off grades and handling of them is absolutely necessary. The best place to get this knowledge is at the sawmill; therefore, a salesman who has had sawmill experience is generally much more valuable than one who has not.

The proposition of selecting lumber salesmen resolves itself almost altogether, after you have considered their natural qualifications, into the knowledge that they have of the business, and I have attempted to give an outline of what knowledge, in my opinion, is necessary for a lumber salesman. If I were selecting one, I would ascertain whether the applicant had a working knowledge of all these subjects, as well as dozens of other minor details which are also very important.

There is one other thing that I think is necessary for the success of salesmen in any line of business, and that is that the salesman's heart be in his work. He should feel that the lumber business is his life's vocation and be proud of it, for very few succeed in any line of work they do not enjoy and take an interest in.

Why Lumber Prices Advance

The natural inclination of the consuming public to object to advancing prices has led the Hardwood Manufacturers' Association of the United States to issue a small folder dealing with the increased prices for lumber. Comparing 1917 with 1914, the association states that the increased cost of labor and supplies necessary for the production of lumber are the chief reasons for the increases. A heavy burden has been placed on the manufacturers of lumber, which ultimately must be added to the selling price. "Lumber, the world's third largest industry, is the only commodity which has not increased in price to any appreciable extent in the past ten years. Prices now are lower than in 1906, while steel, iron, copper, coal, cement, and other building materials have more than doubled in value. The cost of producing lumber has increased out of all proportion to the selling price.

The increased cost of labor and supplies is shown in the bulletin in the following table, which gives the advance between 1914 and 1917:

Logs, bought on market	31
Stumpage	100
Labor	20
Horses and mules	40
Oxen	41
Feed	76
Steel rails	93
Railroad supplies	88
Wire rope	91
Manila rope	103
Machinery	60
Oil	29
Saws	52
Planer knives	160
Belts	96
Packing	32
Files	101
Emery wheels	54
Mill supplies	58
Coal	137
Freight rates	8
Stationery	63
Federal taxes	100
Lumber	12

The "Lumberman Poet" in Toronto

Mr. Douglas Malloch, "The Lumberman Poet" of the American Lumberman, visited Toronto recently and delivered an address before the coal merchants of Ontario, who were then holding a convention. In his section of the American Lumberman of a subsequent issue, Mr. Malloch published the following interesting account of his impressions in Toronto and at Niagara Falls:

"The hand of the war is evident in Toronto. This city of something less than half a million people has sent sixty thousand soldiers to Europe. It is not unusual to meet a young man with an arm or a leg missing or with some other mark of the conflict. The olive-green khaki of the Canadian volunteers is also much in evidence.

"Conscription is looming in Canada, and then the labor of aiding the Empire will be much more equitably distributed. In Canada the age for registration will probably be from 20 to 45. There is the usual amount of debate and discussion, with conscription finding favor in the West and disfavor in the East.

"When the history of the war is written Toronto may look proudly to its part in it. It has given liberally of both its men and its money.

"With conscription in America already in effect, and in Canada impending and inevitable, those who cross the imaginary line find that it is very real in fact. The United States immigration inspectors have arrived at the conclusion, if the Niagara frontier is a criterion, that the way to get the best results is to be as brusque as possible. It is a well-known fact that the guilty are always prepared for rough handling but that the innocent, under such circumstances, go a mile in the air. After having been asked the same question three times in rapid succession, no American, no matter how good he may be, is prepared to deny that he is a German plotter intending to blow up the falls, or a slacker endeavoring to flee the country and ready to leave family, boarding-house, job, creditors, and all behind him rather than go to the French front. Our purpose in this fair city was to deliver an address to a naturally impatient throng at the King Edward Hotel. This crime remained undetected, but the fact that we look young for our forty troubled years came near landing us in the jug. We would suggest to Mr. Wilson that he buy a few volumes on the almost forgotten art of etiquette and send them to his personal representatives on the border."

No More Logging on Menominee River

The last log drive on the Menominee River is under way. With the completion of this drive lumbering on this river, in its time among the greatest log streams in the country, will be over. Five big sawmills will continue to operate for years in Marinette and Menominee, but the logs will come by rail and not down stream. The drive on the Pine River, the farthest north log tributary of the Menominee now, has been begun. It takes about two weeks to get the timber out of this stream into the main river and then the crew begins the long journey with the logs to the Twin cities. The drive this year will not include more than 14,000,000 feet, a little less than last year, and when the logs reach the booms the Menominee River Boom Company's activities after more than fifty years of life, will be practically over. During that time between ten and twelve billion feet of lumber was brought by this concern down the Menominee. One year the total amount sorted was between 600,000,000 and 700,000,000 feet. At that period Marinette and Menominee were the greatest lumber producing centers in the country. The N. Lundington Company, the last concern to log on the Menominee, cut its final growth of pine last winter and all its timber will come in by rail hereafter. The Sawyer-Goodman Company has no more timber on the river and the Menominee lumber companies some years ago quit river logging.

Michigan Camp to Consume 26,000,000 Feet of Lumber

The National Army Cantonment at Battle Creek, Mich., will require over 26,000,000 feet of lumber or 1,325 car loads. The contract for the construction of the cantonment has been obtained by Porter Bros., general contractors, Portland, Oregon, who have a large branch office in Detroit. They report that all the lumber required will be purchased in Michigan. Construction work is to start at once. The contract covers 2,000 buildings of various sizes and calls for an expenditure of more than $3,500,000. The cantonment will be built on a 900 acre tract four miles west of Battle Creek and is designed to house 40,000 troops. The Government desires to have it completed by September 1st. The contract also calls for 30 car loads of railway ties and other timber for five miles of side tracks; also 10 car loads of electric light poles. The camp will be built under the direction of Major M. J. Whitsun, of the United States Engineering Corps.

An active industry in British Columbia is the supplying of ship knees for the many craft that are being built at Victoria and Vancouver. The knees are huge brackets about four feet long and twelve inches square, and are obtained from trees with good solid roots, the angular junction of the root and the trunk being used. Three hundred knees are used for each ship.

The Enquiry Corner

Answers to Questions by Readers
Can We Help You?

Extent of Canadian Lumber Industry

Editor Canada Lumberman:

We would like you to give us some acts or estimates regarding timber and lumber in Canada, and also in Ontario. What is the total amount in feet and dollars of the whole lumber and timber trade in the Dominion? How does the extent of the trade in dollars compare with that in iron and steel? How many employees does it take to run it, both as regards the Dominion and Ontario? Is the supply of available timber becoming less? Do you think the timber trade and lumber industry will improve after the war? Can you give us an estimate of the probable amount of lumber used in Toronto and Hamilton?—Lumberman.

No definite statistical information is available which gives the actual amount or value of the lumber and timber trade of Canada. The nearest thing to it is contained in the annual report of the Forestry Branch of the Department of the Interior for the year 1911, which estimates the volume and value of the trade. This estimate is expressed in "cubic feet of wood cut in the forests," and includes lumber, lath, and shingles, firewood, poles, posts and rails, pulpwood, hewed ties, cooperage, round logs exported, round mining timber, square timber, tanning materials, and miscellaneous products, the total of which was 2,896,000,000 cubic feet, valued at $166,000,000. The figure as to the quantity used, however, refers to "material cut in the forests," only about one-half of which is ever actually put to use.

According to the census of 1911 (Volume III., Manufactures, page VIII.), the value of the "iron and steel products" for the year 1910 was $113,640,610, while the value of "timber and lumber and remanufactures" was considerably more than one-half as much again, namely, $184,630,736.

According to the census of 1911, the number of persons engaged in "forestry" was 42,914. This includes managers and foremen of lumber camps, river drivers, shantymen, office employees, and woodsmen of other descriptions. In "manufactures of wood" 79,793 persons were employed. This included employees in box and fruit basket manufactories, cabinet and furniture makers, cooper and stave makers, saw and shingle mill operatives, woodworkers and turners, office employees and laborers. Pulp and paper makers numbered 2,798 and carpenters 60,203. The total for all these for the Dominion was 185,708.

For Ontario the figures are as follows: "Forestry," 10,620; manufactures of wood, 31,484; pulp and paper makers, 1,143; carpenters, 19,468; total, 62,715.

Fuller particulars in regard to the above questions may be obtained, if desired, in Volumes III. and VI. of the 1911 Census, in the sections treating respectively of manufactures and occupations.

As to the available supply of timber in Canada, the situation as a whole would warrant the statement that the supply of available timber in Canada is becoming less—so much so, in fact, that the Conservation Commission is continually warning the provincial and Dominion Governments that the quantity of timber produced will have to be curtailed before many years to a serious extent unless radical measures of protection are taken both against fire and against wasteful operating methods. The greatest source of reduction in the standing timber of the country has been loss by fire. If we had only the lumbering operations to consider, our standing timber supplies would probably be sufficient for all time to come, but fire has taken an enormous toll in Eastern Canada, and our supply, notably of white pine, has been greatly reduced. On the other hand, new uses are being found for varieties of timber which formerly were not used at all, and of which we have extensive supplies, so that it is a difficult matter to say definitely how we stand to-day as compared with former days. Eastern Canada has undoubtedly lost a great portion of its timber resources. Other varieties being now used and available in large quantities are compensating to some extent for the loss.

In British Columbia the estimates available to-day indicate that the mills are able to cut only about one-fifth of the annual growth of the timber in the province, yet it would not be right to look at the matter from this point of view solely, as the operations are more or less concentrated in available districts, and it is not yet possible to remove the mature growth in all parts of the province; so that both in consumption by the mills and in reduction by timber reaching maturity which is not cut, the proportion of consumption to annual growth is increased.

In the absence of authoritative estimates and statistics regarding this subject little that is of practical value can be said.

It is impossible to say whether the timber trade and the lumber industry will be improved after the war. Opinions vary widely on this question. No one can say what conditions will prevail during the period immediately following the war, but it seems reasonable to expect that, after a period of adjustment, the demand for lumber and timber must improve because of the great number of buildings that have been destroyed in the war area, and because of the renewal of industrial uses that have been interfered with by the war. There will, of course, be a great reduction in the use of wood for war purposes, such as shell boxes, shipbuilding, wagons, railway ties, trench timbers, gun stocks, etc., but many men whose opinions are widely accepted believe that these will be far more than offset by the new industrial demand and by the demand for the rebuilding of the ruined war area.

We have no means of estimating the amount of lumber used in Toronto and Hamilton. The only way to get at this would be to have all of the retail firms and those which sell stock to large contractors, manufacturers, etc., furnish statements of their deliveries during a given year, and we fancy that only an official armed with government authority would be able to obtain figures of this sort that could be depended upon. The government has never published anything of this nature.

Estimated Values of Forest Products in Canada, 1912-1915

Variety of timber.	1912.	1913.	1914.	1915.
Lumber, lath and shingles...	$84,000,000	$71,000,000	$67,500,000	$69,750,000
Firewood	50,000,000	55,000,000	60,500,000	60,650,000
Pulpwood	12,000,000	15,000,000	15,500,000	15,750,000
Posts and rails	10,000,000	10,000,000	9,500,000	9,000,000
Cross-ties	8,000,000	9,000,000	9,000,000	3,500,000
Square timber exported	1,900,000	500,000	400,000	480,000
Cooperage	1,700,000	1,900,000	1,900,000	1,400,000
Poles	1,200,000	1,800,000	700,000	500,000
Logs exported	1,100,000	900,000	850,000	1,325,000
Tanning materials	1,000,000	20,000	22,000	170,000
Round mining timbers	600,000	600,000	500,000	680,000
Miscellaneous exports	300,000	400,000	300,000	175,000
Miscellaneous products	10,500,000	11,000,000	10,000,000	9,500,000
Total	$182,300,000	$177,120,000	$176,672,000	$172,880,000

O. M. Hennessy of Haileybury Drowned

O. M. Hennessy, manager of the Abitibi Pulp and Paper Company, and J. Lavoie, the head foreman, were drowned in the Couchiching Rapids, near Lake Abitibi. The bodies have not been recovered. The men had been missing for some days, and considerable anxiety had been felt as to their fate. A search party was organized, and the paddles of their canoe were found. Mr. Hennessy came of a family that has been connected with the lumber business on the Ottawa River for many years. He was appointed manager of the Abitibi Pulp and Paper Company six years ago, when that concern was organized. He was well known in the lumbering business in Toronto. He was a member of the Town Council of Haileybury. His eldest son, Lieut. Graham Hennessy, is now overseas.

Canadian Railways in a Bad Way

At the annual meeting of the Canadian Manufacturers' Association, recently held in Winnipeg, the report of the Transportation Committee referred strongly to the necessity for additional railway equipment in Canada.. Attention was called to the recommendation of Mr. A. H. Smith, president of the New York Central Railway, in his minority report as one of the Royal Commission enquiring into Canadian railways and transportation Mr. Smith had recommended that the Government should undertake at once to provide for an ample supply of freight cars and locomotives, against immediate and imperative needs.. The committee urged that the convention should make representations to the government to this effect.

Going After the Camp Supply Business

Although the Bowes Company, Ltd., of Toronto, have already worked up a considerable business with lumber camps, furnishing them with a varied line of their excellent food supplies, they have not gone after this class of trade in the same aggressive manner as have many other large food supply concerns. They have now decided, however, to enter this field in real earnest, and are announcing their readiness to take care of the requirements of lumber camps, both large and small. The Bowes Company, Ltd., manufacture such lines as mince meat, butter, jams, baking powder, etc., and are also extensive distributors of various other food products. They carry on a very large business as distributors of bakers' and confectioners' supplies throughout Canada, and, with their extensive buying and manufacturing facilities are in a position to cater advantageously to the lumber camps. An interesting advertisement of their lines will be found in the advertising section of this journal.

Western Operating Cost Increases

Statistics from a Number of Mills Show Remarkable Advances in Nearly all Lines of Labor and Supplies

In resent issues of the Canada Lumberman interesting figures and analyses have been published relating to the present operating costs in connection with the production of spruce lumber in eastern Canada, and comparing these costs with those prevailing before the war caused them to increase. Similar figures have been secured and published by the West Coast Lumberman in regard to the increased cost of production at Pacific Coast mills. In most cases, the figures given can be applied to the British Columbia industry, although the duty on equipment, machinery, etc., and the acute scarcity of labor in British Columbia on account of heavy enlistments for service overseas have undoubtedly made the increased cost in British Columbia even greater than in the Pacific Coast States. The figures given, therefore, may be considered as a conservative statement of the British Columbia situation.

The figures naturally show a considerable range. For instance, steel and iron, which include tool steel, have in some instances advanced as much as 500 per cent., as well as steel and iron castings. Wire rope shows a considerable range. The standard lines have advanced approximately 125 per cent. but the exigencies of the times have brought forward new brands, and many used lines and a corresponding medley of prices. The concensus of opinion is that while the wage item has advanced there has been a simultaneous falling off in efficiency. One mill, which has analyzed its operations very closely, and whose report is one of the most illuminating and valuable ever compiled and published, and which is shown independently, calls attention to the fact that in May, 1915, the plant employed 190 men, whereas in May, 1917, the average number of men employed was 230, and the men were doing the same amount of work. The actual wages per man during May, 1917, showed an increase of 39 per cent., and a decrease of 14 per cent in efficiency, or a total increase of 53 per cent. in labor cost.

This mill summarized its operations as follows:

	1914.	1915	1916.	First Quarter 1917.
Manufacturing cost including supplies.	$ 5.12	$ 4.64	$ 5.66	$ 7.69
Average selling price	11.58	12.45	14.39	15.41

One Oregon mill writes: "Our operating costs, including camp and mill, have jumped up $3.50 per M."

Below is a table showing the percentage of increase in twenty-six commodities in general use in one company's operations:

Items	Increase Per Cent.
Steel and iron	100
Wire ripe	150
Belts	25
Saws	33 1/3
Lubricating oils	10
Shaftings	100
Waste	100
Steel castings	85
Brass castings	150
Nails	200
Tool steel	500
Planer knives	150
Saw teeth	50
Axes	50
Pipe and fittings	100
Hams	85
Bacons	70
Flour	200
Sugar	50
Beans	300
Rice	100
Cereals	40
Syrups	25
Canned fruits	50
Canned vegetables	100
Dried fruits	50
Skilled labor	20
Common labor	50

The following is a comparison of eight items of mill supplies bought during the first half of 1915, as compared with the prices now in effect:

	1917	1915	Advance
Head band saws	$ 3.83 per ft.	$ 5.53	44%
Oats	37.50 per ton.	58.00	55%
Hay, No. 1 Timothy	17.50 per ton	35.00	100%
Mild steel	2.00 per cwt.	5.25	162%
Leather belting	1.17 per lb.	1.68	43%
Tool steel, 1 in., October	.08 per lb.	.14	75%
Lath yarn	.09 per lb.	.21¼	136%
Waste	.09½ per lb.	.15	58%

An average advance in the eight items above of 83 per cent.

The same company's wages during April and May in each of the last four years averaged as follows:

Average daily wage for April, 1914	$2.59
Average daily wage for April, 1915	2.45
Average daily wage for April, 1916	2.79
Average daily wage for April, 1917	3.17
An increase of 29 per cent.	
Average daily wage for May, 1914	$2.59
Average daily wage for May, 1915	2.45
Average daily wage for May, 1916	2.84
Average daily wage for May, 1917	3.42
An increase of 39 per cent.	
Average number of men on plant May, 1915	190
Average number of men on plant May, 1917	230
Doing same work.	

The following tables give a comparison of the labor efficiency of March, 1915, and March, 1917. These figures are considerably in favor of March, 1915, as a large proportion of cut to shipments is in March, 1917.

March, 1915—	
Cut	4,154,022 ft.
Sales	3,977,112 ft.
Average	4,065,567 ft.
Number of man hours worked	52,872
Man hours per M. cut and sold	12.96
March, 1917—	
Cut	4,317,874 ft.
Shipments	3,631,423 ft.
Average lumber handled	3,974,648 ft.
Number of man hours worked	58,932
Man hours per M. cut and shipped	14.81

Taking March, 1915, as 100 per cent. efficient, March, 1917, would show an efficiency of about 86 per cent. There is, however, a large proportion of high priced manufacturing in 1917 as compared with the cheaper shipping costs. March, 1917, is, therefore, somewhat less than 86 per cent. efficient as compared with March, 1915.

From fourteen mills reporting, the following spread of increased costs is reported:—steel and iron, 75 to 500 per cent.; ropes, 50 to 300 per cent.; locomotives, 50 per cent.; saws, 33 to 100 per cent.; shingle bands, 50 per cent.; sawmill machinery, 15 to 30 per cent.; labor, 33 to 85 per cent.; commissary, 20 to 500 per cent.; belts, 25 to 100 per cent.; general hardware, 25 per cent.; oil, 10 to 100 per cent.

Shipbuilding at St. John, N.B.

A St. John, N.B., despatch states that Mr. H. C. Schofield, a prominent shipping man of that city, has obtained a contract from the Imperial Munitions Board for the construction at St. John of two wooden steamships of 2,500 tons each, with sail power and auxiliary engines, similar to the vessels described in the Canada Lumberman of June 1. It was necessary to get a change in the specifications drawn up by the Munitions Board, so that native timber could be substituted for imported kinds which are not easily available. A shipyard will be established at the head of Courtenay Bay, where years ago a great wooden shipbuilding industry flourished. While the first ship is being built materials for the second will be assembled, and it is hoped a permanent industry will result. It is also announced that arrangements are being perfected by a private company to build vessels of another type and smaller tonnage.

Cardinal and Page Open Office at Montreal

Messrs. Cardinal & Page have opened an office at 180 St. James Street, Montreal, as wholesale dealers in lumber and pulp. Mr. H. Cardinal was formerly a partner in the firm of Cardinal & Delorme, retail lumber merchants, Montreal, and Mr. O. Page was for the past five years in the wholesale department of the McLennan Lumber Company, Montreal.

Proposal for Government Control of U.S. Paper Mills

The United States Federal Trade Commission, in its report upon the high price of news print paper, suggests that the government should take over the control of all mills producing news print paper, book paper, ground wood and chemical pulp, declaring that this is absolutely necessary in order to bring about the sale of these grades of paper at a reasonable price and to ensure equitable distribution. This proposal is made in a preliminary report presented by the commission to the United States Senate, and would involve the appointment of a governmental agency to attend to the equitable distribution. It is also suggested that, in order to make the proposal a complete success an effort should be made to induce the Canadian Government to take similar action in connection with mills in Canada.

The Federal Trade Commission's report states that the consumption of news print paper in the United States in 1916 amounted to about 1,775,000 net tons, valued at more than $70,000,000, and that at the prices now prevailing this tonnage would cost news print consumers in 1917 more than $105,000,000, an increase of $35,000,000, or 50 per cent. This increase would fall upon newspaper publishers, and if the advanced cost of manufacture in 1917 over 1916 is estimated at $10 per ton, the report states that one-half of the $35,000,000 increase in the cost of paper would represent additional profits to the manufacturers.

Of course, the proposal made by the Federal Trade Commission does not in any way involve that the idea will be put into practice. It is simply a recommendation to the Senate, and may, or may not, be adopted. At present opinions seem to be considerably divided in regard to the feasibility and justice of the plan. The paper manufacturers are vigorously opposed to it. The newspaper publishers, through their special representative, Mr. A. G. McIntyre, have issued a statement to the effect that their paper committee have not yet taken any official action in the matter, but will unquestionably support the proposal, if it is developed by the Senate and Congress on such a basis that it will not affect or deter the development of the news print industry in the United States. Some of the leading newspapers of the United States have come out strongly in opposition to the proposal, claiming that it would be so extraordinary an extension of government control over private industry as to be a dangerous precedent, and that it involves so many harmful possibilities that they trust the necessity of accepting the recommendation will be removed through some voluntary action on the part of the manufacturers of print paper and through agreements with the publishers that shall be mutually satisfactory and advantageous. Canadians are likely to look upon this proposal, as far as possible, from a disinterested and an outsider's point of view. The intricate relations between the paper-producing industries in the United States and Canada and the fact that much of the Canadian product is consumed in the United States, however, will make it a difficult matter for Canadians to treat a proposal of this sort in an indifferent manner, if it is carried out. In Canada the government has already regulated the price of print paper for a short time, and a government commissioner is investigating the paper situation, with a view to making such recommendations as are required, in order both to develop the industry and to ensure a sufficient supply for the newspapers of Canada. Under these conditions it is scarcely to be expected that the Canadian Government will fall in with any suggestion of this nature until its own commission has made a final report. The whole situation is extremely important and interesting, and developments, which are likely to come quickly, will be watched closely by all who are intimately concerned.

New England Forestry Battalion in England

The battalion of New England lumbermen referred to in a recent issue of the Canada Lumberman, which comprises 10 complete portable units with full equipment and skilled workers, has arrived in England. The men sailed from an Atlantic port on a British transport and were given a great send-off by the lumber trade and other public spirited men whose generosity made possible this substantial assistance to the allies.

The men were entertained shortly before their departure at a banquet at the Boston City Club A number of splendid addresses were delivered after the banquet. Governor McCall, in presenting the mill units on behalf of the New England States, to the Hon. Thomas Hohler, Councillor of the British Embassy, commented upon the fact that a new distinction was Boston's on this occasion. "This movement," he said, "is understood by but few people. The question has been asked: 'Why should we send millmen to Europe? What has that got to do with the war?' My answer is that it has everything to do with the war. It means comfortable buildings erected for the wounded back of the lines; it means the rapid restoration of the bridges necessary for military strategy; it means trenches lined with wooden sheathing which will obviate to a great extent the unpleasantness of mud; it means the accomplishment of work for which the allies have neither available nor trained men.

"There is no body of men who will contribute more to the success of the allied cause than you whom I see before me, and I think that you should feel that you are as much America's contribution to the war as if you wore a uniform and carried a gun. I trust it will not be very long before we can welcome you back again to the shores of America."

In accepting the units in behalf of England, Mr. Hohler described them as "New England's most splendid gift to Old England and one that will do much to bind the countries together as never before in the world's history."

It is a wonderful change in the history of North America and of England that has made possible the sending forth of the first unit for service in France in behalf of Great Britain and the allies, from the port of Boston, which nearly a century and a half ago was the scene of the "tea party" which was the prelude of the American revolution.

Lumber Firms Prepared to Furnish U. S. War Needs

The lumber committee of the advisory commission, Council of National Defense of the United States, estimates that 2,000,000,000 feet of lumber may be used for purposes directly connected with the war in the next twelve months. The committee is given to understand that provision will be made at each camp for anywhere up to 40,000 men, instead of the 25,000 originally planned. This may be due to the decision to call for 125,000 men to serve as a reserve for the first 500,000 men drafted for the new national army. Second in quantity of lumber required comes the wooden shipbuilding program, which the committee estimates will require about 400,000,000 feet of lumber.

In a statement the committee says: "The best estimate that can be made of the total amount of lumber required for purposes of national defense within the next twelve months is 2,000,000,000 feet. This sounds like a colossal figure, and it is a big figure, but should give no apprehension that it will disturb the markets or cause a shortage of lumber. Actually this will not exceed five per cent. of one year's lumber production of this country."

Other lumber requirements will include: Structures for training camp purposes for the navy, 200,000,000 feet; aviation school cantonments, 120,000,000 feet; erection of 200 buildings at army and navy training camps by the war work council of the Young Men's Christian Association, 6,400,000 feet; packing boxes and crates for the army and navy at least 200,000,000 feet; army wagons, 25,000,000 feet; gunstocks, 10,000,000 feet; material for 3,500 aeroplanes, 3,500,000 feet.

Army cots, tent poles, automobiles, artillery, cooperage, furniture, docks and piers, trench lining, saddles, mine timbers, tools, railroad construction and the lumber necessary in building factories will help to swell the total.

The special committee representing the Southern Pine Association, acting for the Southern Pine Emergency Bureau, announce that an order for 100 ships, to be sawed by the southern mills, has been placed by Gen. George W. Goethals, general manager of the United States Shipping Board Emergency Fleet Corporation, at an average price of $35 a thousand feet at the mills. The Southern Pine Association has asked those mills which can do so, to manufacture the timbers required for wooden ships, and a large number of them have bound themselves to furnish complete schedules at the prices named, for delivery at such shipyards as may be designated by the Government. General Goethals has accepted this proposition, to the extent of 100 units (ships), comprising approximately 140,000,000 feet of lumber.

"Sawdust Facts"—A Mershon Band Resaw Booklet

William B. Mershon & Co., Saginaw, Mich., have published an interesting booklet, entitled "Sawdust Facts," which is devoted to descriptions and other useful information regarding band resaws, and particularly those produced by William B. Mershon & Co. The booklet contains an insert, with illustrations and brief descriptions of their extensive line of band resaws, and also useful information regarding their operation. Readers who are interested may obtain copies of the booklet by writing to the company.

HAMILTON
Steam Tension Band Mill
Single and Double Cutting

Special Features of this Band Mill:

(1) Tension on saws maintained by steam—quickest and most sensitive form of tensioning yet devised.
(2) Unbreakable saw guide raised and lowered by steam—**first used on our machine.**
(3) Great saving in saws—actual tests have proven saws have a longer life on this machine.
(4) Both top and bottom wheels instantly aligned by screw adjustment.
(5) Takes saws 12 in. to 14 in. wide.
(6) Heavy, rigid, strong and accurately built throughout.
(7) Built by expert workmen in a plant that has been manufacturing high grade sawmill machinery for sixty years.

May we send you a list of satisfied users?

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Maple and Birch

Wanted several cars 4/4 No. 1 Common Maple and Birch; also few cars of thick stock, either dry or this year's cut. Box 583, Canada Lumberman, Toronto, Ont. 11-14

Wanted

Wanted second-hand timber, Fir, Spruce or Pine. State condition and price. Box 593, Canada Lumberman, Toronto, Ont. 12-15

Poplar, Birch and Maple

Wanted a large quantity of:

1 in. log run Poplar.
1¼ in. log run Poplar.
1½ in. log run Poplar.
2 in. log run Poplar.

Also 2 in. Birch and 2 in. Hard Maple. State quantities and prices for dry or new cut. J. H. Jones, Thamesford, Ont. 12-13

For Sale–Lumber

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.
400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce.
Piled widths and lengths separate.

GEO. C. GOODFELLOW,
c Montreal, Que.

For Sale–Machinery

For Sale

One No. 5 C. B. Rogers 15 x 6 S. H. Planer and Matcher, with countershaft and:
1 pair 1 in. Shimer Flooring Heads.
1 pair 1 in. Shimer Shiplap Heads.
1 pair 3 in. Shimer Flooring Heads.
1 pair 4 in. Shimer Jointer Heads.

The Bertrand, Lockhart Lumber Co., Ltd.,
13-14 Port Arthur, Ont.

For Sale

One second hand sixty horse power return tubular boiler. Apply P. O. Box 669, Haileybury, Ont. 13-13

Shingle Mill For Sale

One new upright shingle mill with edger for sale. Apply to A. Duquette, Papineauville, P.Q. 13-13

Machinery For Sale

16 in. x 38 in. Wheelock Engine.
New Berlin Swing Saw.
24 in. Pony Planer.
Leather Driving Belt, 62 ft. 3 in. x 22 in., double.
No. 3 Jewel Dynamo Engine.

R. LAIDLAW LUMBER CO.,
11-14 Toronto, Ont.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

A PRACTICAL LUMBERMAN, forty years old, with twenty years' experience, is open for engagement June 1, 1917. Last ten years with very large Canadian firm as superintendent and sales manager. Best of references. Box 496, Canada Lumberman, Toronto, Ont. 2-16

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED MAN to take charge of Planing Mill. One who is capable of setting up machines, filing and grinding pattern knives. Address Drawer F., Sarnia, Ont. 13-t.f.

WANTED DEPOT CLERK for Ottawa Valley lumber firm for Northern Quebec Depot, fifty miles from railway. State age and give references as to previous experience. Good position and steady employment for the right man. Box 591, Canada Lumberman, Toronto, Ont. 12-13

Business Chances

For Sale

Timber Limits and Sawmill, estimated fifteen million feet of hardwood and ten million feet soft woods. Sawmill capacity 25 M. feet, shingle mill 125 M. Docks, tug, booms, logging outfit, houses, etc. Price $35,000.

The Manitoulin Lumber Co., Ltd.,
11-22 Walkerville, Ont

Sawmill For Sale

Complete Sawmill for sale, cheap and easy terms. Capacity 20,000 feet per day. Field Lumber Company, Limited, Field, Ont. 11-t.f.

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

Miscellaneous

For Sale

Biggest snap in British Columbia, five square miles License Timber, estimated fifty-eight million feet and forty-one thousand cedar poles. Two miles to Railway and River. Price $1.50 per thousand, or $40,000 cash. Other timber available. Write owner.

W. MARK DeCEW,
12-13 Grand Forks, B.C.

PROVINCE OF QUEBEC

Department of Lands and Forests

Quebec, 2nd June, 1917

Public notice is hereby given that, in conformity with the law, on the 21st of August next, at 11 o'clock a.m., at the office of the Minister of Lands & Forests Dept., Quebec, there will be offered permits to cut timber on lands belonging to the Crown in the Upper-Ottawa, Lower-Ottawa, St. Maurice, Lake St. John, East and West, Saguenay, Rimouski West and Bonaventure West agencies, comprising several large blocks in the Abitibi, Upper-Ottawa and head waters of the St. Maurice and Gatineau and on River Chamouchouan.

Permits will be adjudged to the highest bidder.

The price of adjudication is payable in 3 equal instalments.

The permit to cut will be subject to the ordinary conditions of the Law and Regulation and the grantees of any of the aforesaid territory must, within a delay of three years, manufacture, in the province of Quebec, with the timber cut in said territory, either pulp or paper in the proportion of ten tons per day, or sawn lumber in the proportion of ten thousand feet board measure per day, per hundred square miles.

Further information may be had by applying to the Department of Lands & Forests.

Elzear-Miville Dechene,
Deputy-Minister,
13-16 Dept. of Lands & Forests.

A Miracle in France

Thanks to the genius of the French race, and its indomitable industry, it is hoped that large numbers of the fruit trees which the Germans did their best to destroy, and in many cases succeeded in destroying, may be saved. Mr. Hy. Wood, the special correspondent of the United Press of America with the French Armies, tells in a despatch how this "miracle" has been wrought. Throughout the entire district devastated there were thousands of trees that the close pursuit of the French prevented the Germans from cutting down completely. Instead the kultured tree-killers cut off a circle of bark which, with a few days' exposure to the sun would have been enough to kill them.

These trees presented the easiest problem. The wounds were bound up by thousands of army surgeons, and Red Cross ambulance drivers and stretcher carriers assisted. The circle was first covered with a special grafting cement, and the entire wound then carefully bandaged, often with bandages prepared for human limbs. Tar was used for the work, and finally even a loamy clay. In the end it was found that moss, twisted and tied about the dressed wound, was as effective as anything else. A much more serious problem presented itself where the trees had been cut down. But here French genius also solved the problem. The stumps, protruding usually two or three feet from the ground, were first trimmed off so as to conserve the sap. This stump was then treated with the grafting paste and carefully bandaged till the tree lying at the side budded from the sap that remained after being cut down. Branches that showed great numbers of buds were then cut off and grafted into the prepared stump. Today these grafts are in full leaf and blossom, and years have been saved in restoring the cut-down orchards.

Last Upper Mississippi Log Drive

The last big log drive on the upper Mississippi river is now on its way to the mills at Minneapolis, according to R. H. Chute, secretary of the Mississippi & Rum River Boom Company. "When the last of the drive is brought in next summer, the river will be clear of logs, except for dead-

heads, which are yet to be raised from the bottom. These logs can not be driven but will probably be sawed at small mills along the river."

The rear of the final drive is expected to reach Brainerd or Little Falls before the river freezes up in the fall and will be ready for sawing early next spring. The logs in this drive will keep the mills going through next summer but the activity thus developed will undoubtedly be the final windup of one of the most important industries in the early history of the city.

In commenting on the prospects of the closing of sawmill and logging activities in Minneapolis, Caleb D. Dorr, pioneer resident, and at one time boom master, said: "In the early days a log drive was about the biggest and most important thing to be had in this part of the country. It seems hard to believe that this is the last one. If I am physically able I hope to go up to the mills some day before it is over and see the logs come in."

Foresters Find Carbonized Spruce

A very interesting deposit of carbonized wood, principally Sitka spruce, was recently found by a party of timber cruisers headed by Blaine H. McGilcuddy, a former student at the College of Forestry, in a slide on the ocean beach at Camp Creek, near Talolah, Wash. The coal was used as fuel for several days and readily burned in a camp fire, leaving very little ash. Specimens submitted to the College of Forestry indicate that the deposit consists of spruce so perfectly carbonized that even the microscopical details of the woody structure are almost entirely intact, a condition which is very rare in coal measures. The extent of the deposit has not been definitely determined, though the possibility of the existence of high-grade coal fields in this region of the state seems to be indicated. The specimens have been added to the museum collection of the College of Forestry.

U. S. Building Wooden Warehouses

Lumber requirements of the United States Government to meet the nation's war needs will be materially increased as a result of the decision of the storage committee of the Council of National Defense to build at each army camp a warehouse 100 feet wide and 1,000 feet long. A number of great storage warehouses are also to be constructed at tidewater. The government has let it be known that it will expect the quickest possible deliveries for all materials, and the facilities of mills and railroads will be taxed to the utmost.

It is reliably reported that each ship yard is planning to build from three to six boats simultaneously and they want the material for each boat to arrive at the same time in the following order: Keels, framing, planking, decking and interior stuff.

Some of the contracts announced for wooden ships for the government include: Sloan Shipyards Corporation, Seattle, Wash., 16 wooden ships; Gray's Harbor Motor Ship Corporation, Aberdeen, Wash., 4 wooden hulls; Cust Shipbuilding Company, Portland, Ore., 4 wooden hulls; Terry & Brittian, New York, 20 composite steamers complete; Skinner & Eddy Corporation, Seattle, Wash., 6 steel steamers; Merrill-Stevens Company, Jacksonville, Fla., 12 cargo-carrying steamers complete; 4 steel composite steamers; Los Angeles Shipbuilding and Dry Dock Co., Los Angeles, Cal., 8 cargo-carrying steel ships complete; G M. Standifer Construction Corporation, Portland, Ore., 4 wooden cargo vessels complete.

England Planning After War House Building

The English Government and such organizations as the National Housing and Town Planning Council are actively considering the problem of building in Great Britain after the war. At a recent meeting between government officials and a deputation from the National Housing and Town Planning Council to discuss building projects it was stated that the government would probably be called upon to furnish £20,000,000 to help in the actual building, according to the Timber News of London. It was further estimated that 160,000 houses would have to be built each year during the ten years following the war. This gives some idea of the magnitude that the importation of lumber into England is likely to attain.

Flight-Lieut. Bigwood Killed in France

A cable despatch received by Mr. W. E. Bigwood, of Graves, Bigwood & Co., Toronto, on June 28, from the British War Office, stated that his son, Flight-Lieut. Paul Herrick Bigwood, of the Royal Flying Corps, has been killed in action in France. Lieut. Bigwood went overseas with an infantry battalion and later was transferred to the Royal Flying Corps, serving in France as an aviator only a short time. He was twenty-one years of age.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario continues fairly active. Enquiries are good for many lines, particularly for stock for export to the United States. The activity in this line, which developed recently on account of the possibility of the United States imposing a 10 per cent. duty on imports, has continued, in spite of the fact that the Senate has killed the duty proposal. Wholesalers are now expecting that the United States will be extensive buyers of Canadian lumber during the balance of the present year. The United States Government will take all the low-grade yellow pine it can secure, and the effect will be an improvement in the demand for Canadian lumber. Stocks offering at Ontario mill points are very light, nearly everything appearing to have been contracted for already. There is a good demand for spruce lath, and prices are strong.

Shipments are fairly good, with the exception of those going through the Niagara frontier to the United States, congestion on the railways making it difficult to send stock forward.

The local trade in Ontario is encouraging. Hemlock is strong throughout the province. The Western Ontario demand is exceptionally good. Much of the stock moving is on shell box account, although builders are buying a little more lumber than they were a short time ago. The general industrial demand is also good, particularly for the agricultural implement and car trades. Good cutting-up lumber and good sidings are very scarce. One and a half to two-inch are practically off the market. Collections generally throughout Ontario are reported good.

Hardwood market conditions are changing so rapidly that it is difficult for the trade to keep in touch as fully as it should. A number of mills are now manufacturing quite a quantity of No. 2 common in their thicker stock, and there is a tendency on the part of the trade to buy some of this, so as to reduce their costs. How successful this experiment will be remains to be seen. Possibly the trade will take it, and, again, it is quite possible that they will not. With the prices such as they are to-day, it is reasonable to expect that the trade will make up their minds to use this line of stock.

Probably there never was such a shortage of basswood in Canada and the United States as there is to-day. No one ever seems to ask what basswood is worth, but simply whether it can be obtained. This has been caused almost entirely by the fact that, comparatively speaking, there has been practically no basswood taken out this year.

Prices of practically all hardwoods have been advancing steadily of late. This is attributed to the great shortage of stocks and the large demand that exists. Buying of hardwoods for United States army purposes is on a very large scale.

The situation in connection with the export trade is commencing to look somewhat more promising. Those who have been following it closely report that available supplies of home timbers in Great Britain and France are badly depleted and that a renewal of buying in America is not unlikely. The influence of the forestry battalions in Great Britain and France is expected to be favorable to the export trade in hardwood when the demand again develops. In an indirect way their operations are counted upon to improve the export demand. The manufacturing methods of the forestry battalions are said to be so superior to those prevailing formerly in Great Britain and France that it is probable that new buying methods will be adopted and that importers in those countries will in future be less inclined to take thick lumber and do their own sawing. Instead of this they will realize that, in order to get the best out of the log, they should buy definite sizes of stock on the American grades.

Eastern Canada

Conditions remain practically unchanged in the lumber trade at St. John, N.B. No stocks have been moved for export during the past fortnight, with the exception of about 1,000,000 feet taken by transports. The result is that the mill yards are rapidly filling up. No new English sales are reported, and few are expected while the embargoes continue. A slight easing off is reported in the American market, but enquiries continue plentiful.

Spruce boards continue firm. There is a scarcity of low-grade or refuse lumber, and prices are firm. Reports from Nova Scotia indicate improvement in the American demand for scantling, boards, and laths. Present indications are that on account of the lack of tonnage a large quantity of deals will remain over unshipped this season. Many mills are sawing their logs into planks, for which there is a good demand in some parts of the United States.

A fair volume of business is reported from Montreal, but orders have shown a slight falling off. Improvement in the car service is reported, and stocks are moving more satisfactorily. Prices are firm in all lines. The United States demand continues strong, particularly for hardwoods, and the outlook is for a continuance of these conditions for some time to come. Dimension timber is quiet, but there is a good enquiry for British Columbia stocks for shipbuilding purposes. Exports to the United Kingdom are very light, and practically all on government account. A small quantity of stock is going forward to South Africa. A better movement of stock for export is reported from Quebec and lower ports, some being loaded for the French Government.

Spruce dimension is a little less active at Boston, but prices continue firm. Important orders are being placed with spruce manufacturers by government agents, and some manufacturers are looking for still higher prices. The War Department is expected to buy 25,000,000 feet at an early date, to be used for army buildings. The general belief is that the demand resulting from the war will more than offset the lack of dwelling house construction. Quotations for random are a little easier, New Brunswick manufacturers having commenced to seek an outlet for stock that they are unable to ship to the United Kingdom. A firm market is reported for boards, which is expected to continue until shipments from the South can be resumed on a heavy scale. Hardwoods at Boston are very firm, and the demand is good. Great difficulty is experienced in obtaining stocks. Hemlock is somewhat firmer at Boston than it was a fortnight ago. Government purchases are expected to reduce available stocks and to create a shortage of lumber for building purposes. The demand for shingles at Boston is a little higher, but shipments are more difficult to obtain and prices are steady. Bad weather and the higher cost of materials have reduced the building construction demand. Some of the large producers have withdrawn quotations until they can catch up with orders. Lath are not quite so firm, and the demand is light.

House building operations in the New England States are practically nil. The demand for manufacturing purposes is fair, and there is only a slight demand for sash, door, and blind factory products.

United States

Trade conditions in the United States seem to be rather disturbed, no doubt on account of the general readjustment period through which the country is passing on account of the war. Building permits for the month of May showed a decline of from 30 to 35 per cent. as compared with May, 1916. The greatest loss was in New York City, where it amounted to 77 per cent. Extensive decreases were also reported from Chicago, Philadelphia, and most of the other large cities. The retail trade in general is experiencing less activity.

The yellow pine industry is still suffering on account of the inability of the railroads to handle their shipments. Many mills are still out of the market, and purchasers who want heavy structural timbers are experiencing great difficulty in locating mills that will undertake to furnish them. The government business is increasing daily, and for this purpose cars are as plentiful as the conditions require. Prices continue firm, and in many cases show an upward tendency. The demand for white pine continues as heavy as ever, and stocks at Northern mill points are inadequate. The demand for white pine is particularly strong in the East, where embargoes have curtailed shipments for so long that stocks on hand are now very low. White pine prices are firm. The hemlock market is strong, the demand being good and stocks light. Prices continue to advance, and the general belief is that the volume of trade will continue at the high level for some time. Manufacturers are all sold well ahead, and extensive orders from the government are expected. Much stock is being shipped in a half dry condition to meet the demands of urgent customers.

The demand in the fir trade continues strong and active. Many mills are refusing to quote on prospective orders, as they have so much business still left to clean up. The car situation on the west coast has improved in several shipping districts, and the volume of shipments has almost become equal to the normal production.

The hardwood trade is very active in all districts where government business is being placed, but the demand from retail dealers and factories is showing a decrease, as is usual at this time of year. Manufacturers are thus obtaining an opportunity to catch up on shipments. Improvement in the car supply is reported, particularly in the northern districts. Stocks are not large in the hands of manufacturers, factory

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

consumers, or retailers. Prices everywhere are firm, and are governed almost entirely by the ability of the shippers to fill orders promptly.

Great Britain

The lumber trade at London continues active. Case makers have so many orders for immediate delivery that they are fully employed, and are searching everywhere for available stocks. Although the home supply is coming in more freely now than formerly, it is far from sufficient to meet the requirements of the trade, and imported stock is being drawn upon heavily. While fresh arrivals are very light, the trade is hoping that the recent change in the office of controller of timber supplies may lead to favorable action in the direction of permitting the importation of wood goods. Undoubtedly such a change is needed, and prompt action would be greatly welcomed so as to avoid the shortage which is certain otherwise to develop in the very near future.

The Liverpool trade is somewhat encouraged by the recent decision of the government to permit the importation of Scandinavian goods under license whenever occasion requires. This is a welcome change in the government policy, and importers are hoping that it will be followed before long by a similar removal of the restrictions against importations from Canada, where suitable stocks are available. Although the transportation difficulties in connection with Canada are much greater than those in connection with the Scandinavian trade, it is not unreasonable to hope that an opportunity will be given before long for importations from Canada.

Manchester dealers have had to tackle the English-grown stock to a greater or lesser degree, although naturally they prefer to deal in the imported goods because of their greater suitability. It is reported that prices of English timber are steadily rising, and that really good stocks are bringing high prices.

The first of the season's arrivals from Montreal were recently reported at Glasgow. These, however, were of very small proportions. It is expected in some quarters, however, that more space will be allotted to timber before long, and that the same concessions will be extended to Canadian goods as have been granted to Scandinavian shipments in regard to the limits of sales permitted. It is not considered probable, however, that consignments from Canada this year will be otherwise than on a very moderate scale. Some lines at Glasgow, particularly rock elm, pitch pine, etc., for shipbuilding purposes are practically exhausted, and consumers are hoping that the government will permit free importation. No move in this direction, however, is reported as yet. There is a good demand for birch plank, and as stocks are greatly reduced, prices are very strong. Lower port planks are now worth about 5s per cubic foot, and Quebec lumber about 6s per cubic foot. Very little Quebec stock is on the market, such as there is belonging to the merchants.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Mills Still Heavily Stocked

St. John, N.B., June 23.—(Special to the Canada Lumberman.)—During the last two weeks conditions have remained unchanged. Positively no lumber has been removed by tramps. During this time transports have lifted only about a million feet; the mills are being rapidly piled up. No English sales have taken place recently, and, with the embargoes, it looks as if sales would be very limited, although it is not known just when the Allies may wish to purchase further stocks. This is the only avenue which can be looked forward to to relieve the present situation.

The American market it not quite so firm as it was two weeks ago, but there are still plenty of enquiries coming into Canada. If stocks could be railed to New York, New Hampshire, and Halifax points considerable material would be moving. Boston and Maine points are not so easy to reach in some cases, and the New England market is not big enough to take care of every order, but, combined with New York it is. Prices have fallen about $2 per M. on dimension and random. Spruce boards remain firm at $22 f.o.b. St. John.

Supplies of low grade or refuse lumber are scarce, and prices remain very firm.

All the main river drives are in the booms. With water at such a pitch, no logs could remain on the shores.

Parrsboro, N.S., Trade Report—Heavier Shipments to the U.S.

Parrsboro, N.S., June 20.—(Special to the Canada Lumberman.)—The condition of the lumber trade from Parrsboro has completely changed since last year. In former years our deals found a ready market in the United Kingdom and, until some months after the beginning of the war, all shipments overseas were made in square-rigged vessels and steamers. Then came a time when the scarcity of tonnage compelled the employment of our larger schooners, but the shipments continued, and the quantity shipped was nearly as large as ever. This year not a single deal has been shipped direct to the United Kingdom, and, although the British Government bought deals here last year, to be delivered this season, there is as yet no sign of any shipments.

The lumber trade with the United States appears to be even brisker than usual, and large quantities of scantling, boards, and laths are being constantly exported. Much of this lumber is carried in American bottoms, owing to the fact that many of our largest vessels have been sold this season. The reduction of our fleet still continues, and no less than five three-masted schooners hailing from this port have been sold within the last three or four weeks. It may seem strange that ship-owners will sell their vessels while freights are so high, but it must be remembered that ship property deteriorates rapidly, and is exposed to many risks, and when owners of vessels long past their youth are offered two or three times their original cost, there is naturally a strong temptation to sell. Meanwhile the demand for tonnage is increasing, and although the new vessels which will soon be launched will do something towards relieving the pressure, yet it is probable that considerable lumber will be held over for lack of tonnage. In fact, it is fairly certain that a large number of deals will remain on hand, but there may be some unexpected changes even in that class of lumber. A large three-masted schooner has just commenced loading deals at this port for New York, and it is possible that this initial cargo may lead to a demand for more. Then, too, the lumber operators are adapting themselves to the changed conditions, and many mills are sawing their logs into planks, for which there appears to be a good demand in some parts of the United States, instead of making deals, as they have been accustomed to do. And even if a considerable quantity of lumber has to be held over next winter, there seems to be no danger of greatly reduced prices.

Montreal Markets—Trade with U.S. Active

Montreal, June 25.—(Special to the Canada Lumberman.)—Although business is good, a slight falling off in the orders received is reported. There is the same difficulty in securing from the mills the required stock in certain lines, but with the car service in much better shape, goods are coming forward in a fairly satisfactory manner. Prices are as firm as ever. The smaller orders received by wholesalers are attributed by some to the uncertain conditions created by the conscription discussion.

Purchases for the United States are still good. The representative of a Boston firm states that the lack of labor has caused a shortage in lumber, and as the demand for hardwoods in particular is very heavy, wholesalers are looking to Canada for supplies. His opinion is that the requirements for practically all kinds of wood will be very large for some time to come, owing to the industrial outlook and the extension of the shipbuilding industry.

The trade in dimension timber is on the quiet side. Many enquiries for British Columbia lumber for shipbuilding purposes have come to hand, but the extensive local demand has tended to restrict it coming east. For all that, the buying has been on an important scale, and would be even better were larger supplies available. The Imperial Munitions Board, it is understood, will not place contracts for wooden vessels unless there is an assurance that the lumber supply is assured. Some vessels in the Maritime Provinces and also in Quebec are being constructed largely of spruce, as a substitute for British Columbia fir. It is conceded that this is inferior for the purpose, but the vessels are regarded more or less as temporary expedients, and will serve their purpose to overcome the dstruction of vessels by the submarine.

The Munitions Board recently prohibited the use in Eastern Canada of British Columbia fir for ship-staging, presumably on the ground that the lumber is required on the Pacific Coast. This lumber comes in lengths up to 24 feet, and the order of the board directed the use of spruce in place of fir. Enquiries made at the chief lumber points in the Province of Quebec elicited the answer that it is impossible to obtain spruce of this length in any quantities from stock for immediate use. Had such lumber been asked for months ago it would have been forthcoming, but at this season it is out of the question to manufacture it.

Exports to the United Kingdom are on a very small scale, the

PURER MILK

for Your Men at Less Cost to You

Liquid milk has been replaced in cooking by the modern milk powder, KLIM.

KLIM is made from the purest and freshest milk received daily from Ontario farms at our plants in Burford, Hickson, Brownsville and Belmont. The milk is separated, pasteurized and reduced to powder form by the most sanitary mechanical process obtainable. KLIM is used in all cooking, and is more

CONVENIENT,
TIME-SAVING,
ECONOMICAL

than liquid milk.

KLIM costs less than any other form of milk because it will remain sweet and pure until the last grain is used. It does not require ice in Summer nor will it freeze in Winter.

You save 75 per cent. in freight charges, as you pay freight on nothing but milk solids which contain all the food value in the milk.

If you have not tried KLIM, order a sample 10 lb. tin from your supply house to-day.

WESTERN BRANCH—1642 Pandora St., Vancouver B.C. **EASTERN BRANCH—Hull, Quebec.**

occasional cars that are sent being nearly all on government account. Some small consignments are going to South Africa. The entire shipping is now under the control of the government. Advices from Quebec state that lumber there, and at lower ports, is moving more freely, some being loaded for the French Government. It is evident that lumber is urgently required in Great Britain, as the Secretary of the War Office has announced that, in order to ease the present stringency in the supplies of lumber as far as possible, without sacrificing more important interests, the War Cabinet has authorized the importation, under license, in neutral vessels of soft wood from the countries of Scandinavia, when it will not displace cargoes of foodstuffs or munitions.

The sulphite pulp market has undergone little change. The demand, however, is not as active as it was, say, two months ago, and prices have receded. The Riordon Company is doing a fairly good foreign business, having recently sent consignments to Spain and to Calcutta, while a quantity has also been sent to Italy. The ground wood market is steady, with a moderate demand.

New Season's Cut Now on Ottawa Market

Ottawa, June 26—(Special to the Canada Lumberman):—The Ottawa lumber market, while fairly well stocked, maintains firm prices, with a tendency toward higher levels. There is a fair demand for the various kinds of lumber, with the exception of building materials. There is considerable demand for dry lumber, but the supply is not great. The first of the green cut came to the local market last week. Prospects for logging and cutting in the bush this season appear brighter than at a corresponding period last year with some of the mills, the pulp cut being excepted. It has been reliably forecasted that the J. R. Booth interests will not have as big a cut as last year on account of the British embargo being in operation. A permit has to be secured before any lumber can be shipped to England, thus seriously curtailing the firm's large export operations.

Building operations, with the exception of the reconstruction of the Parliament Buildings, are not being carried on to any great extent, though showing a greater activity up to the present, than for a similar period a year ago. The manufacture of shell boxes, which is being carried on by many of the mills, replaces the inactivity of building materials. There is at present a scarcity of fuel supplies of wood, in comparison with the summer season of 1916. The Estate James Davidson expect to operate their Fort Coulonge sawmill for seventeen weeks this summer. Last summer it operated about six weeks. The cut of the firm this year will be large. Despite a shortage of labor, the Ottawa factory is working up to capacity, being especially busy on shell boxes, having sufficient orders of this nature to keep them going for two months.

New England Market in Peculiar Condition

Boston, Mass., June 22.—The New England market has been in a peculiar position lately. There has been a good deal of scarcity of lumber and a great scarcity of transportation, particularly from the South. The mills there have absolutely been unable to fill their orders. They cannot get cars and cannot get permission to ship. At the present time there is a hard and fast embargo on the New Haven Railroad, which takes in more than half of New England, and nothing can be shipped on to that line except to junction points, we understand. The demand for boards has been pretty strong and the supply very light. Spruce boards have been very firm in this market. We are overrun ourselves with orders for dressed lumber.

On the other hand, there has been a good deal of cessation in house-building here, and we think the ordinary retail trade to the builders is very small, but it is being replaced in a large measure by government business, box business, and lumber for the building of large plants. Factory hardwood flooring, for instance, is next to unobtainable. The Eastern mills in the United States are getting hardly orders enough for small spruce, and there is some weakening in price on spruce from Nova Scotia and New Brunswick, such as 2 x 4, 2 x 6, and other small sizes of scantling and timber.

On the other hand, there is an order just about to be placed for about fifteen million feet of lumber of one kind or another to go into a camp at Ayer, Mass., where troops are to be trained. This should set the situation right on small spruce as quickly as it is placed, which we imagine will be within the next week or sooner.

We have heard of no recent large purchases by Americans in the Canadian market, although no doubt small ones are being made all the time, as we made a few ourselves. There seems to be a feeling among the trade that prices have about reached the top, and it will be difficult to force them any higher—in fact, the average retail lumber dealer is not buying, as he feels prices are beyond his reach, and he sees little trade coming his way. White pine is very scarce and firm. The box trade, of course, is heavy. Nobody can look very far into the future, although government requirements will doubtless be large, which will keep many other kinds of business active. Some kinds of business are suffering to some extent, and the demand is changing from a peace basis to a war basis, which makes things uncertain. Labor shortage is being felt in this country about as much as it is in Canada now, and will probably be much greater when the draft goes into effect. It seems to be the ordinary common labor that is shorter than almost anything else. We think building work can be done pretty rapidly at the present time, as builders are not busy.—Lumberman.

Southern Hardwoods All in Strong Demand

The Hardwood Manufacturers' Association of the United States, in their market letter under date of June 23, say: The hardwood market continues strong and active. There never was such a demand for hardwood lumber and such scarcity of dry stocks as exists to-day. In the Eastern territory stocks are generally oversold and production is below normal, due to the acute labor situation. In the Southern territory daily rains have interfered with logging operations, and stocks are anything but large in the hands of manufacturers.

The whole tone of the market seems to be firm, and there is absolutely no diminution in the call for lumber of almost every description. Building permits for May show a decline of 36 per cent. when compared with those of the same month in 1916, and the demand from the furniture trade has slumped somewhat, but truck and wagon manufacturers, shipbuilders, and the government have entered the market stronger than ever, and have more than offset any indication of slackening in other directions.

Lumbermen are about to be called upon to face extraordinary and wholly unprecedented conditions. There has already been a heavy drain on labor resources, and the taking of a half-million young laborers from the country this summer is going to have a serious effect upon the production of lumber. Especially is this true in the South, where every mill is already handicapped by the scarcity of labor. The cost of production is increasing out of all proportion to the selling price, and this heavy burden placed on the manufacturers of lumber must ultimately be added to the selling price. When you are weary of explaining the why and wherefore of the so-called high prices of lumber, tell friend customer that lumber is no higher to-day than in 1906, while the cost of everything entering into the cost of manufacturing lumber has more than doubled.

The car situation begins to show some signs of improvement. On May 1 the shortage was 148,627 cars. On June 1 it was 105,127 cars.

There is a splendid demand in oak, both white and red, quartered and plain. The demand for sound square-edged timber planking, switch ties, freight and passenger car stock is especially good. Prices depend entirely on the character and size of the enquiry. Low-grade oak is practically cleaned up; 4/4 No. 1 common, plain, white, and red, are much stronger than thirty days ago.

Poplar in all grades and thicknesses is in fine demand. Stocks are low, with no chance for betterment. The lower grades in all thicknesses are especially strong. All thicknesses in No. 1 common are in demand. The upper grades are active and prices higher.

There is a decided shortage in chestnut stocks, and numerous concerns seem willing to take green lumber in order to secure a supply of stock. The demand for sound wormy continues strong. In fact, the demand in all grades far exceeds the supply.

Ash continues in good demand, with prices steady. The upper grades, especially in thick stock, are in strong demand and very scarce.

The demand for gum continues strong and active, with a fine demand from manufacturing consumers. There is a big demand for the lower grades in all thicknesses. Wagon box boards are active, with rapidly advancing prices. Quarter-sawed red and sap gum continues to move steadily at firm prices.

The demand for cottonwood continues strong, with the market quite firm. The lower grades are exceptionally strong as a result of the big demand therefor from box manufacturers. Wagon box boards are in good demand. Dry lumber in practically all grades is scarce.

Liverpool Spruce Deal Market

In its issue of June 9, the London, Eng., Timber Trades Journal says:—"There have been no arrivals of any weight at Liverpool since our last report, and forward business is non-existent up to the present as restrictions have not been withdrawn, and the prospect for the future is certainly not encouraging. The Government, it is understood, have bought heavily on f.o.b. terms, and already some stocks have come forward; but until they have secured all their requirements it is unlikely that private importers will have much chance of securing anything. The spot market is good so far as demand is concerned, and consumers are being strictly limited when applying for permission to buy, and in many cases are advised to turn their attention to the native woods, which, as everyone knows, are not to be had in any quantities, or with any regularity, even if suitable for their purpose,

which in the majority of cases they are not. There appears to be a good deal of complaint over the attitude of the Government's requisitioning stocks in importers' hands, as it is now nearly three weeks since they advised what they required, and as far as can be ascertained none of it has yet been inspected. In the meantime, charges are going on, and if not satisfactory on inspection the loss of interest and rent, etc., should be added on to the restricted prices, if there is any equity at all. The removal of the restrictions on Scandinavian woods will not materially help private importers to replenish their stocks at current prices, and as spruce is unobtainable there is no doubt that there will be a famine in timber unless the position alters very considerably."

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending May 31st, 1917. is furnished by H. W. Lightburne & Company, Liverpool, England, and their St. John, N.B., representative, John E. Moore & Company, Limited.

Forest Service Aided in U. S. Registration

The Forest Service of the United States made every effort to co-operate with the State Bureaus of Registration for the National army by carrying information into the remote mountain regions of the Western States. Members of the district offices and the supervisors' offices were detailed in a number of the mountain counties to aid county officials in charge of registration. Rangers and guards, mobilized for the approaching forest fire season, made good use of the Forest Service telephone systems by calling up mountaineers, and in many cases riding the trails. The importance of this information work in the mountains could only be realized by those who know that many families in the more remote mountainous regions of the western forests ofttimes go for weeks without getting their mail or seeing a visitor.

Applications for enlistment in the United States Forestry Regiment for work in the forests of France are pouring in upon the Forest Service from lumberjacks, woodsmen, and outdoor people from all parts of the State of California. The applications are placed on file and action will be taken as soon as the final plans for the formation of the regiment are received from Washington. To date about sixteen officers from the National Forests in California have been listed for commissions. Trained foresters and expert lumbermen are to be in command. Axemen, tie cutters, sawyers, lumberjacks, saw filers, millwrights, portable sawmill men, teamsters, blacksmiths, cooks, motorcycle and motor truck operators will make up the rank and file. The duties of the regiment will be to aid in supplying the continuous and insistent demand for lumber for railroad and road construction, cantonments, posts for wire entanglements, timbers for roofs of dugouts, and numerous other purposes.

Plans for the immediate mobilization of a detachment of 300 United States lumbermen for serice in England in the allied cause were perfected at a recent meeting of representatives of large lumber interests of New England, as a result of informal international communications by cable between the Massachusetts Committee on Public Safety and the British Government. This is expected to be the first of several detachments of the United States' most efficient woodsmen.

Trade Outlook Justifies Optimism

By Edward Hines

Fundamental facts must be reckoned with in whatever of consideration is given to any subject. Different viewpoints, the outgrowth of various opinions and too often vague theories, unfortunately, not only retard progress, but render a really intelligent discussion of a subject, if not well nigh impossible, at least indefinite and leading away from satisfactory and successful conclusions. Of the many illusions under which the manufacturers of lumber have suffered greatest harms during the past decade, none have been so harmful or so injurious to our progress as the one conceived in the too general belief that individual effort counts for as much to the welfare of the industry as the co-ordination of interests. Selfish interests opposed to co-operation of all interests; subordinating the good of the institution to individual desires and the greed for individual aggrandizement have, from the beginning of time, interrupted progress and destroyed opportunities. To accomplish the desired end it is of the utmost importance that the majority be followed by the minority.

The problems that confront the manufacturers of lumber to-day are largely fraught with elements that have always prevented the advancement to which the industry is rightfully entitled. A too apparent disregard for essentials and a quiescent mental attitude that has threatened to become a permanent condition of the mind, coupled with a general tendency to reject anything that is new and away from the traditional customs of more or less doubtful value, have conspired to render the solution of our difficulties troublesome and annoying rather than pleasing and gratifying.

General conclusions are too often drawn from too small a number of observations, and from an exceedingly limited knowledge of actual conditions. Failure to comprehend actual facts and the tendency to be misled by theories and impractical ideas are quite as detrimental to our success as that smug confidence in which so many of us repose, satisfied that we have accomplished all that is ours to accomplish and all that it is possible to do. The inertia of minds at rest; the inclination to stubbornly defend older ideas because at some time or other in the past they have yielded profit, notwithstanding their apparent uselessness in this generation, and the failure to respond to a renewed and more lively interest in the prospects of our industry for the future, are every one of them elements that we must meet with determination and strenuous opposition if we expect to succeed in our efforts to establish our undertaking on a level with other great pursuits in the world's commerce. I cannot too strongly impress upon you the necessity for taking your association work more seriously. There is so much to be accomplished, so much to think about, and so much to do, that, while the task seems sometimes to be gigantic and almost insurmountable, nevertheless the duty is ours to perform, and there can be no reasonable excuse for our shirking it or attempting an evasion of our responsibilities. Instead of shooting at pink snakes and purple toads, let us direct our aim at something more tangible, something really more vital to our well-being as an industry. History tells us what has happened in the past, but not the future, and it remains for us to help mould the future and shape our destinies with a view to knowing what the future shall be. Whoever accepts the past for a guide must expect to be led backward. The world has profited slightly indeed from the resurrection of old records—its astounding benefits have come through the exploration of unventured spaces and the exploitations of unobserved opportunities. Civilization's coat-of-arms is marked with the surveyor's transit, the mariner's compass, and the scientist's test-tube. The barriers in our way have yet to prove too great for courage and reason.

In our contemplation of the future and what it shall reveal to us, as to the permanency of values of our products and how best to attain that permanency, we must carefully consider the present conditions, what has brought them about, and how they compare with added costs of production, and watch and heed the future that affects our costs and probably future increases. These added costs of production are elements too for future reckoning, in that they may or may not fluctuate in proportion to the market fluctuations of lumber. The recent enhancement in prices of quite every item of lumber of all kinds, has come about through a combination of circumstances that renders it difficult to even guess what may happen in the time to come. We can only fortify ourselves with facts as they are presented to us, and by making such comparisons as are necessary to enable us to arrive at a practical solution of what we must do to avoid past errors and future complications. In my investigation of existing conditions I have been impressed with the astounding array of cost of materials that have increased our costs of operation far beyond any figures I have considered possible. And in my preparation of comparative costs, relative advances in prices, etc., of the various commodities of commerce, I can but feel that whatever of advantage may have accrued to the benefit

WOOD BROKERS

FOR EVERY CLASS OF TIMBER

***Head Office:* HULL, England**

To the Lumber Companies of Canada:

You have the Goods. Place your Lists with full particulars in our hands. We are in daily touch with all the Buyers in the United Kingdom.

PLEASE NOTE.—We pay cash against all documents, and take the whole of the Delcredere risk on Buyers.

Install a KRAFT SODA MILL

CANADA has another big war opportunity: Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc., have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods.
The cost of installing plant is small and you make a sure profit from waste material.

Write to-day for further details

of lumber has been decidedly small by comparison with those that have affected nearly every other known product.

A careful consideration of these advances shows a startling appreciation on some articles, a very marked advance on others, and relatively a modest advance on lumber and woodwork. They show conclusively that lumber is not high in price by comparison with almost every other product.

For instance, pig iron has advanced since 1914 about 400 per cent.; copper, 115 per cent.; 26 grades of metal, 107 per cent.; canned goods (where they can be had), 100 per cent.; lard, 100 per cent.; wheat and flour, over 100 per cent.; wrapping paper, 82 per cent.; glass, 80 per cent.; coal, from $3.40 to $6.50; lumber, 15 per cent.; woodwork, 15 per cent.; woods labor, over 100 per cent. and less efficient; mills and yards, from $1.75 to $2.50.

From this you can see that lumber and woodwork have not attained the distinction of having reached to the general level of values of other products.

Of the numerous items of supplies, provisions, etc., which manufacturers of lumber must use in their operations, I have found that the average advance in cost by comparison with figures that prevailed in 1914 is about 75 per cent., for instance:

	Cost 1914. Per doz.	Now. Per doz.
Mill brooms	$ 4.50	$ 7.00
Belting	1.73	3.46
Babbitt	.05½	.10
Machine bolts	1.68	2.69
Riveted chain	.20	.42½
High speed P.M. knives	.24	.75
Lath twine	7.00	21.00
Nails	1.88	3.94 and advanc'g
Hexagon nuts	4.50	9.00
Pulleys	3.20	7.68
Band saws	73.60	110.40
Rope	10.75	24.27

General food provisions have averaged from 75 to 200 per cent. higher, notably beans, from $2.80 to $7.50; flour, $4.50 to $9.30 and up; potatoes, 60c to $2, and so on.

You are all familiar with the increased labor costs. In the woods in two years, about 100 per cent., and with at least 25 per cent. less efficiency, the average extra costs running around $4 per thousand feet. At the lumber plants labor has gone up about 50 per cent.; skilled help, 10 to 15 per cent.

If we are to hold our own, maintaining values at a level commensurate with those that we must secure in order to show a fair value for our stumpage with added costs of operation, taxes, interest, depreciation, overhead charges, and last, but not least, the risk of the elements, destroying in many instances millions of feet of timber by the ravages of wind and fire, we have indeed a problem, the solution of which will put to the test our best efforts and our most intelligent cooperation. There must also be a better understanding of the opposing forces that are sure to compel our attention, once we return to a more normal level of business conditions. Temporary advantages such as we are now enjoying cannot be made enduring without a broader and more liberal intercourse and a more confiding and less restricted understanding as between the widely diversified interests of our industry. The weaknesses that disrupt closer relations between the various elements of so great and vast an undertaking must be eliminated, root and stem, and there must come a harmonious blending of all these elements.

Willows are weak, but they bind the fagot. There is mighty little strength in a single unit or in many units acting without the singleness of purpose that characterizes the success of any project or undertaking. Harmoniously blended in unison and of one accord, they securely weave their great influence throughout the webb and woof of our commercial life, and firmly bind the object of our efforts with irresistible and irrepressible solidity.

Of the many splendid opportunities that present themselves for our careful thought and consideration, as offering inducements to our better conception and understanding of these opportunities, witness the recent return of a world-wide demand for wooden ships—of a type long since discarded, but now deemed to be useful again since the demand for tonnage is so much greater than the supply. On both the Atlantic and Pacific Coasts shipwrights who learned their trade a generation ago have come back to work with mallet and adze, trimming the frames of wooden ships. Who shall say that this resumption of activity in this industry may not foretell a long and useful career for wooden ships, and the amount of lumber required in this new channel is beyond our conception, and is bound to have its effect on all kinds of lumber values.

In recent years the new type of wooden block pavement, made of creosoted wood, has found a place as a practical utility for purposes of serving a public need for a better street pavement. There has been some concerted effect on the part of manufacturers of lumber here and there, to create a favorable public sentiment for this useful material, but it has not gone far enough; it has not penetrated beyond the ephemeral popularity of a new product, and the real value of its suitability has not been revealed to the layman who needs to know facts before he becomes thoroughly interested. This also furnishes food for thought for the future in considering the demand for common lumber.

In the twentieth century demand for fireproof construction in buildings there is open a field of great possibilities for us in educating architects and engineers to the larger use of wood in the erection of a type of slow-burning construction that answers to every practical demand for the ideal fireproof building. Some effort has been expended in the direction of educating the public to the excellence of this class of buildings, but in this, too, we have not progressed as the exigencies of the situation demand.

Doubtful results have been attained in the substitution of steel for wood in many types of cars, and I am not so sure that railroad officials have not concluded to discontinue entirely the use of steel in a great many instances. Granting that obviously good reasons exist, why, in certain parts of car construction, steel is preferable to wood, by the same taken, wood should replace steel in other parts, and it is our duty to ascertain the facts and present them in a practical way for a more logical selection of materials that shall hereafter be used in this work. There will shortly be an enormous amount of material used for constructing new cars and repairs, to relieve the unprecedented shortage, and we are certainly entitled to our shade of this business.

Many other examples of substitution of materials for wood and wood products may easily occupy our valuable time in our efforts to get at the facts pertaining to these substitutions. There are good and sufficient reasons why concrete serves numerous and useful purposes to the exclusion of wood; but there are likewise correspondingly good and valid reasons why wood should retain its safe estate in many instances, where previously it has been misplaced without good cause.

While we have had some information about the high costs of general building material that have been in effect during the past year, and the very recent talk of some slight advances on lumber as compared with other commodities lumber comes in competition with in the building line, that it would affect and retard building in the larger cities, particularly of a speculative character, flat-buildings, the cheaper class of homes, etc., it is true only to a limited extent, and probably in the larger cities it has affected trade as compared with a year ago from 15 to 25 per cent., but this must not be given too much consideration, as we have found in many instances that the increase has been most marked. In addition to that, the tremendous amount of money in the rural districts and apparent crop prospects will further stimulate and bring about further returns in home deposits, the farming community, the smaller town communities must have more money to build with now than ever before, so that the year of 1917 should show as much, if not a greater, volume of building than ever before; and when you consider the enormous number of new boats being built, for ocean service, lake service, and river barges, for transportation of coal and other commodities, the amount of lumber which the government will use for construction of barracks, together with the increased mining necessarily taking timber and other lumber; the increased building of factories and enlarging of others, in which to manufacture the many products formerly brought here from Europe, which will also create an enormous demand for crating material—the industry has every reason to look forward to a greatly increased volume in shipments and a materially less production in all lines necessarily creating a shortage in the actual stock on hand, as each month will show this year.

In the marketing of our products there has been all too little real sagacity shown, and unfortunately the sales end of our business has not kept pace with the activity displayed in what may truthfully be said to be twentieth century salesmanship. A dilatory consideration of the need for more intelligent direction of this extremely important department of our business fully justifies criticism and censure, and I am hopeful that a more intensive effort and a keener perception of the need for improvement in this department may soon eventuate.

The evolution of ideas defying traditional fallacies and replacing ancient and time-worn customs with modern and down-to-the-minute twelve-cylinder activity, promises the solution of our difficulties. Events of the past few years have disclosed the urgent need for reforms and the stern necessity for the zealous pursuit of precepts that make for the general betterment of the industry. Strength lies in the fortifications against intrusion and invasion, and to secure such strength we must forget personal aggrandizement and work for the general betterment of our industry as a whole.

Reports from Vancouver, B.C., state that there is still no surplus of logs in the market, and that the demand is better than it has been for some time. The output has been restricted by the backward spring, the shortage of labor and materials and other causes. The prospective demand for long logs for shipbuilding purposes is expected to increase the prices for fir logs.

A Jeffrey 6-Ton Storage Battery Locomotive at the Yard of the C. A. Smith Lumber Co., San Francisco, Calif. (Equipped with Edison Batteries).

You Can Economize in Men, Mules, Horses and Money by Hauling Your Lumber with Jeffrey Storage Battery Locomotives

The most flexible and inexpensive haulage system known. No skilled labor required to operate.

Releases many men for other work and insures greater speed in hauling, handling, loading and unloading.

Fire hazard less than any other form of mechanical haulage; no fire risk from sparks, back fires or hot gases.

Jeffrey Storage Battery Locomotives are giving excellent service in many of America's Big Lumber Mills.

Let us advise you regarding your haulage requirements. Write for Bulletins.

Handle Lumber for DISSTON SAWS made in Disston Mill

Portion of Apple Logs in the Disston yards ready to be sawn into boards from which saw handles will be made

Carload after carload of logs come into the Disston plant almost continuously to be made into handles for Disston Hand Saws and parts of other Disston Tools.

These logs are sawn into boards **in our own saw mill.**

Thus, not only are Disston mill saws constructed along scientifically correct lines, but they are constantly subject to practical test in the Disston plant.

Well made saws thoroughly tested are the saws for economy and satisfaction.

Timely Advice to Lumber Salesmen

R. A. Long Tells Why Active Trade Can be Counted Upon to Continue, and Even to Improve

The disturbance of business activities resulting from the war furnishes a series of problems that some lumbermen hesitate to tackle with confidence. Leaders in the industry, however, are generally able to see through the uncertainties of the present into a future of exceptional business activity, and even into a period of good trade during the continuance of the war.

R. A. Long, president of the Long-Bell Lumber Company, Kansas City, Mo., a man of broad vision and keen foresight, has put this conception into striking and convincing words in a letter to salesmen, in the course of which he writes as follows:—

I have noticed in reading your reports that some curtailment is anticipated in building operations as a result of the advance in cost of material and labor, and that some anticipate there will be a general slowing up in business operations.

There is really no precedent whereby we can make an exact comparison, but there are many fundamental principles which do not change; so let us analyze the underlying conditions at this time:

In the first place, many people seem to be laboring under a wrong impression. They are figuring the price of everything has advanced, whereas the purchasing power of money has decreased. And when we compare the relative exchange values of one commodity with another, there is not such a great difference as many seem to think, although it is true that everything entering into munitions of war has increased on account of the excessive demand.

I attribute the decrease in the purchasing power of money to a great extent to the increased circulation. In the United States the circulation per capita has increased from a little over $34 before the war to over $45 at this time. The percentage of gold money in circulation in the United States at this time is greater than it was before the war. While the supply of gold has decreased some in Europe, it has not been to the extent that the supply has increased in this country, because we have had the annual supply of gold throughout the world added to the general stock. And a greater prcentage of the gold production has been coined into money and placed in circulation throughout the world than was true prior to the war. The expansion in the money in circulation in the warring countries has greatly exceeded that in the United States, not because of the increased gold, but the credits have been expanded so that the money in circulation throughout the world to-day greatly exceeds what it has been at any time in the past.

I have noticed in some of your reports that building is being curtailed on account of the high prices of lumber and other products entering into the construction. The builders reason that lower prices will prevail later. I cannot understand how they arrive at this conclusion, because the change has come about by the decrease in supply of almost everything, and the increase in the supply of money. So long as the war continues the number of producers will not increase, but, on the contrary, will continue to decrease. The demands in this country will increase by reason of our entering into the war; the labor supply will decrease; and, hence, the price of everything must increase.

While it is true that rent in most localities has not increased, in the past the interest rates on money have governed to a large extent rental values. Should interest rates increase the rental values will advance proportionately. The relative differences will adjust themselves. The law of supply and demand will govern.

As to Building Activity

With all business activities running to the maximum of labor supply, it is hardly fair to presume that the demands for building will decrease. Should some of the builders discontinue operations, will not those who continue have a better opportunity to make more out of their operations because of the reduced supply and reduced competition than under normal conditions? It seems to me that the question to be considered by the builder is: "Will the purchasing power of a dollar increase after the war?" No one knows. But we do know this, that inasmuch as a large part of the civilized world that has heretofore been producing, has been engaged in consuming and destroying for three years; the accumulations of centuries are about exhausted; the producers are being taxed to the limit in all countries, and their energies confined to the bare necessities of life, luxuries being fast eliminated altogether. We know, also, that over seventy billions of dollars of indebtedness has been incurred by the different warring nations. The interest per annum on this amount alone is equal to about twenty-five per cent. of the entire indebtedness of the world before the war. And while some of the nations may be forced to go through bankruptcy and pay only a small part of the indebtedness, the chances are very remote that any very great per cent. of them will do so. A large portion of the most thickly populated and richest producing territory of the entire world has been devastated. All of this territory will unquestionably be reconstructed as soon after the war as supplies and the human energies of the world will permit. The law of supply and demand has always been, and probably always will be, the controlling factor in the trade of the world. So is it not fair to presume that before there is any perceptible increase in the purchasing power of a dollar these supplies and demands must be replenished. And if the nations owing the large indebtedness pay the interest on even 50 per cent. of it, the laborer, the merchant and the manufacturer must all make money in order to pay the tax that will be necessary to assess and collect. With all of this confronting us it is not likely, for many years to come, that money will have the purchasing power it has had in the past.

"Keeping Business Going"

Statements have been made that our country prosperous can pay our war costs as they come, and have enough over to aid our allies; while, on the other hand, our country unprosperous, business halting, money hoarded through fear or false economy, will be hard pressed to keep food on the table and clothing on the back. "Keeping business going" is a patriotic slogan. Keep money in circulation; keep employment for everyone; keep wages good so that we can have money to spend for war sacrifices. The billions of dollars to be expended in war preparations will be put into circulation in our own country, and this, in itself, will create new wealth for use in the world-struggle for humanity. And the one thing which might halt business now is an unpatriotic, psychological feeling of panic and false ideas of patriotic economy. Every effort possible should be made by both the public and the individual to foster and hold up trade to the end that there will be no unemployed.

The demands of the government are felt particularly in the steel trade, and the distribution of the output of steel for war purposes is the greatest problem in the industry, for with the market so largely sold up to the private trade, the new order of things is liable to cause some serious disturbance. As yet the government's requirements are not fully known, but they are supposed to be about 5 per cent. of the steel production this year, and prior to the government's coming into the market the manufacturers of steel were unable to supply the demand. As a result, the price of iron and steel continue to advance, and those receiving the benefit are placing the money in circulation.

As to the Crop Outlook

While the late season has been detrimental to some crops, much of the winter wheat being killed, later reports show great improvement, and the condition of the wheat crop was known sufficiently early that it permitted the seeding of the ground with some other crops. We believe there never was a time in our history when so great a percentage of our acreage had been planted for some kind of a crop, and at this time the condition of the soil throughout the country is in excellent shape and a splendid return on the whole is fully expected. There have been times when large crops have not meant increased revenues to the producer because of the exceedingly low prices at which they might be marketed, but this year is an unusual exception. No matter what quantity of any crop may be raised, there will be a demand for it, and at extremely high prices. An average yield of ten bushels per acre is usually considered very small, but multiply such a yield by the prices for wheat prevalent to-day, and you will note a tremendous yield in dollars per acre. Carry that thought with you pertaining to all crops, and it seems to us that the value of the products of the soil this year will almost be beyond computation, and we may rest assured this money is going to be invested in some manner, and we believe you will agree with us that it is practically universally true when people are making money they are strongly inclined to spend quite a per cent. of it in building homes and other improvements belonging thereto, and so we are looking for an unprecedented demand for lumber and other building materials during the next several years, and at high prices. We hope you may view the situation in the same way, and if so, we are assured you can so present the matter to your customers as you meet them from day to day in a manner that will cause them to use a greater amount of the materials we furnish than would be true if the people were not educated, or given some substantial reasons to believe that the present prices of building materials are with us for years to come.

There has been a great deal in the newspapers in recent weeks about economy and conservation. We are of the opinion that many of our citizens have misinterpreted our President's message bearing on this subject, for we are sure he did not intend that we should not pursue our business in a most vigorous way the same as of old, save that we should exercise the greater care that no waste of either food or energy might apply. These are unusual times, necessarily more or less confusion is with us, and so let us devote our time and energies towards keeping business going. It is up to each of us to do our part. What think you?

Is That the Best You Can Do?

By W. G. Funcke*

As usual, the retail lumberman is confronted with this question when quoting the farmer on his bill of material. Of course, you expect him to ask you this question. It's a fact that you have taught him this habit. Force of habit, nothing more and nothing less, prompts the farmer to come back at you with this question.

If you make the sale without cutting your price, you laugh and remark to the second man "that he was easy." It has been my experience that the farmer asks this question as soon as you give him the price. (Providing you are the low bidder). It does not occur to him that there might be a difference in the grades or the quantity figured upon. You meet your competitor's bid. You wonder how it is he can sell so cheap, so you figure your actual cost only to find that you have made the sale without profit. Naturally, you are worried.

So finally, in a roundabout way, you ask Mr. Farmer for your competitor's bills so that you can check them against yours. You find the mistake, your competitor left out something. You recall having argued about the price being right—and you said something about the quality—but the fact remains that you cut the price. You feel that the farmer had driven a good bargain. But Mr. Farmer feels differently; as he drives home he thinks. He asks himself this question over and over again. Why didn't I ask for a cut of $100. I could have gotten it just as easily. He convinces himself by the time he gets home that you are still making too much profit on the sale of the bill.

Cutting your price destroys confidence. It suggests a change in the grades or that you will resort to some other method of getting your profit. Of course, every job calls for some extras, you can charge more for this stock. What is the result? If the farmer is on to his job, he will call for an itemized statement.

You will be interested in a case that took place recently. The mail order man happened to be in the territory at the time and was asked to quote on a bill of material. His price was $800.

The farmer was at the stone sharpening the teeth of the reaper blade. Without stopping to look over the bill of material he asked, "is that the best you can do?"

The farmer insited that you will have to do better if you want the business. "Yes, Sar, you will have to do a whole lot better," and added, "Just think of the advertising you will get out of furnishing this bill. This barn will be built on the most prominent road in this country."

The mail order man was determined not to cut his price. He talked quality, prompt shipment, newly cut material and SERVICE.

An urgent request to check over the other bills, only resulted in "I know the other bills are correct."

"But," the mail order man pleaded, "how do you know they are correct?" "Well, didn't John, my carpenter, make out all the bills—they are right."

"It is better to have quoted at a profit and lost than to have cut the price and furnished the bill at less than cost."

Impatient over trying to sell the bill at $800, the mail order man started for his automobile, only to be called back after closing the door. "Did you say you could ship at once?" Further assurance as to the mail order company's ability to ship at once secured the order.

After some talking the farmer was persuaded to show the retail lumberman's bids. One was priced at $960; the other at $975.

With order and check in pocket, the mail order man extended best wishes for a bumper crop, a hearty thank you and farewell.

Several days later, the farmer receives a letter of acknowledgement with memorandum invoice. The invoice read, "Your order has been entered as follows: Check it over carefully as only the items listed will be shipped."

The farmer wires: "You left out the shiplap for all inside walls." Upon checking order back against carpenter's list it was found to be correct.

The mail order man had the money. He insisted that the business was his; in fact the car had been shipped. So, the order held. While the farmer occupied rather an embarrassing position, he had told his friends about the good buy he had made, and it would never do now to tell them about the mistake. To tell his friends that the mail order man's bill was not complete would injure the contractor and ruin his reputation as a shrewd buyer.

In many localities, the retail lumberman is obliged to live up to the customs or traditions of the past. Tradition is a better word, for it suggests something that is old. Something that has been handed to us by our forefathers. Surely this practice of adding a fictitious profit with the expectation of cutting the price to get the business is an old-fashioned idea.

IF YOU WIN YOU LOSE. You may get the business but you lose the customer's confidence. You have proven to him in a very convincing manner that you asked too much for the material in the first place. Again, you have aroused the old fire "Lumber prices are too high." You know the result.

The mail order man has the same proposition put to him in a slightly different and a more tempting manner. The estimate priced at $960 is received with a check for $925, and instructions to ship at once if you want the business.

You can well imagine the result of the mail order man accepting the business at the cut price.

If the mail order man would have accepted the business at the cut price, he would have put himself on record as being willing to cut his price to get the business. News of this kind travels fast: within a short time, the mail order man's office force would be occupied in bargaining with the customer over the price.

To save his business from complete ruin he would have to add to the price at which he was willing to sell an extra sum, the amount he was willing to cut.

Price cutting will not be cured in a day, so this is suggested as a partial remedy. If you have to cut the price to get the business, make a change of some kind. Look over the bill and suggest some other grade, or if necessary, tell your customer about some "special stock" that will allow you to make a cut.

The "special stock" may be your regular material, but refer to it as special or some export material that you picked up at a good price because of the scarcity of bottoms for off shore shipping. Hit upon a good excuse for cutting the bill, if you must, and stick to it.

The mail order man never cuts his price without making a change. It may be nothing more than beaded car siding in the place of three-quarter inch partition—but the change in name serves its purpose.

Price cutting will not stop until the retail dealer becomes fully conscious of the power of SERVICE to get business at a profit.

In the future, the large line yard companies will select men with direct regard to their ability to put a stop to price cutting. After all it is a case of individual effort and individual ability to stop this practice.

You cannot measure up to this standard of salesmanship unless you concentrate when you talk to the farmer. The dealer with a stiff upper lip will sell the farmer instead of letting the farmer sell him.

When you concentrate you use your head, you plan, you analyze and you offer to co-operate. You convince the customer that you will be a help in the building of his home or barn, a real help. Prove to him that you know something about building. More than he does.

Another important feature of every profitable sale is the amount of confidence you inspire, the amount of faith you have in your business. Make your customer believe what you say.

This is successful salesmanship, you can not master the art if you loaf on the job. If you neglect your customers. If you let the customer talk about high prices. Like everything that is worth while, success in selling comes to those who work for it, who think about it and to those who deserve it.

You have heard the statement that 90 per cent. of the business men fail. Many failures are the result of poor selling methods.

Do you belong to the successful 10 per cent. or the 90 per cent., which includes the "price cutters?"

Use your head; don't become scared and act on the impulse.

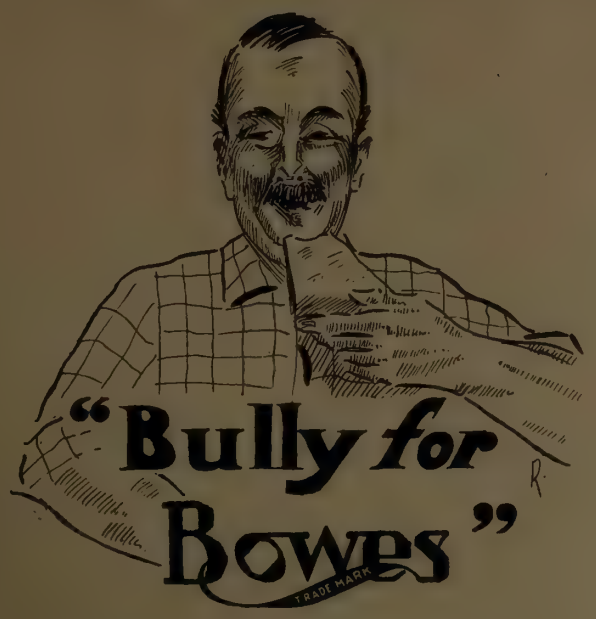
*Reprinted from the Retail Lumberman.

Maine Output Chiefly Pulpwood

Mr. J. A. B. Cowles, of the Pejepscot Lumber Company, reports that the greater part of the cut in the State of Maine this year is pulpwood. Two conditions operated to bring about this result: the shortage of pulp wood and the consequent demand and the competition of the red wood lumber from Oregon and Washington. Since the opening of the Panama Canal it was possible for the western lumbermen to lay down in the eastern States clapboard of red wood at a cheaper rate than they could be manufactured for out of Maine spruce, and as a result of this competition many of the lumbermen were confining their operations to the getting out of pulp wood. The labor situation was causing the operators worry, particularly as it was getting more difficult to obtain skilled laborers, who preferred to work in munition factories in the cities, to lumber mills in the woods. Their own company had been very fortunate in this respect, as most of their men had remained loyal to them..

An Interesting Air Compressor Bulletin

The Canadian Ingersoll-Rand Limited, Montreal, have issued bulletin K-302 (16 pages 6 x 9 in.) illustrating their line of steam-driven, straight line single stage air compressors. The type of machine described is designed to meet the requirements of those who need compact self-contained units of small and medium size for service in shop, foundry, mill or electrical plants, etc. Among the leading features of the design which are dwelt upon in the bulletin are the automatic splash lubrication, dustproof construction, "Circo" silent leaf valves and quick convertibility to belt drive.



He's Happy because He's Well Fed

and it's just plain horse sense that he's going to work harder and better than the man who is ill-nourished.

Of course, a man might get lots to eat and still be badly fed; quality is every bit as important as quantity.

Then there's the matter of price. In a nut-shell then what you want is

The Most of the Best for the Least

and there isn't another supply house in Canada better equipped to give you what you want than the house of Bowes.

We'll gladly prove this to you—give us the opportunity.

The Bowes Company, Ltd.

EDGINGS

Ontario

The Allen Lumber Company, Waterloo, Ont., have been registered. L. K. Allen and G. H. Allen are interested.

John B. Smith & Sons, Limited, Callender, Ont., recently suffered a small loss by fire. The loss was fully covered by insurance.

Fire recently destroyed the mills of the Standard Chemical, Iron and Lumber Company of Canada, Limited, at Longford, Ont.

The Abitibi Timber Company, Limited, has been incorporated with head office at Toronto, Ont., and capital stock of $300,000, to carry on business as manufacturers of lumber and timber. The provisional directors are J. W. Bicknell, T. S. H. Giles, J. S. Duggan, W. B. Sturrup and R. A. Stewart, all of Toronto. J. A. M. Andrews, Lumsden Building, Toronto, is also interested in the company.

Under the supervision of Mr. J. F. Hewitson, 260 men are employed on the construction of the new pulp mill at Port Arthur, Ont. The company will manufacture the highest grade of chemical pulp and the capacity will be 50 tons per day, which may be increased to 60 tons by forcing production. Each of the two digestors will be 32 feet high and 19 feet in diameter. The mill will be built upon solid rock foundation.

John Piggott & Sons' mill at Windsor, Ont., had a narrow escape from destruction by fire recently. No damage was done to the building, but a loss of about $1,500 resulted to the stock. The loss is covered by insurance. The fire originated from a gust of flame blowing out into the shavings bin when one of the workmen opened the furnace. Prompt response by the fire department was responsible for confining the blaze to small limits.

Eastern Canada

The Halifax Shipbuilding Company, Limited, Halifax, N.S., have obtained a charter.

Giguere and Fournier, lumbermen, Shawinigan Falls, P.Q., have been registered. Albert Giguere and Amedee Fournier are interested.

Gauthier and Gervais, lumbermen, La Tuque, P.Q., have been registered. D'M. L. P. Gauthier, Ernest Gauthier and Alfred Gervais are interested.

The Wayagamack Pulp and Paper Company, Three Rivers, P.Q., are preparing plans for the erection of an extension to their mill. Mr. R. C. Whitehead is manager of the company.

Plans have been completed by the Three Rivers Box Company, care of N. E. Clement, Three Rivers, P.Q., for the erection of a box factory to cost $60,000. The manager of the company is Mr. M. N. Gilbert, d'Israeli, P.Q. Tenders will be called shortly for two sheds, 1½ storey, 150 ft. x 70 ft., plastic brick construction, and a sawmill 1½ storeys, 100 ft. x 40 ft.

The capital of the Quebec Forest Product Company, Ltd., is $40,000. The object is to manufacture pulp and paper and to act as dealers in lumber, pulp, and paper. The following are interested: Messrs. F. C. Charlot, lumber agent, Cambridge, New York State, U.S.A.; J. P. Galibois, bookkeeper; J. G. McLaughlin, real estate agent; A. G. Nosworthy, architect, and Ant. Paradis, office clerk, of Quebec.

On August 21 next the Department of Lands and Forests of the Provincial Government of Quebec will offer for sale by auction timber limits in the districts of Upper Quebec, St. Maurice, Lower Ottawa, Lake St. John West, Lake St. John East, Saguenay, Bonaventure West, and Rimouski West. The largest area is 1,200 square miles, situated in the Upper Ottawa and upper basins of the Rivers Kapitajiwan and Sho-Shoquan. A condition of the sale is that the purchasers must within three years manufacture within the province from timber cut on the territory either pulp or paper in the proportion of 10 tons per day to the 100 square miles, or 10,000 feet board measure of lumber per day per 100 square miles.

Letters patent have been issued by the Lieutenant-Governor of the Province of Quebec incorporating the Laurentian Forest Protective Association Limited. The Hon. R. Turner and Messrs. B. A. Scott, lumbermen, A. J. Price, manufacturer, C. A. Sewell, manager, and Robert P. Kernan, lumberman, of the city of Quebec, are interested. The powers granted include the installation and operation of a system of fire protection in the following district: bounded on the west by the eastern boundary of the timber lands under the control of the St. Maurice Forest Protective Association, Limited, on the north by the height of land for waters running into Lake St. John and Saguenay River; on the east by the height of land for waters running into the River Laval; and on the south by the River St. Lawrence. The Association also has power to establish and maintain a telephone system, build and maintain roads and trails and observation towers, and to co-operate with others in the protection of forests from fire. The capital is $20,000 in $2 shares.

Western Canada

The Empire Lumber Company, Limited, have opened a branch at Canora, Sask.

The North West Lumber and Supply Company, Limited, has been incorporated with capital stock of $200,000, and head office at Regina, Sask.

Lumber Products Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $45,000, to carry on business as lumber and timber merchants, sawmill proprietors, etc.

The Western Canada Shipyards Limited, has been incorporated with head office at Victoria, B.C., and capital stock of $30,000, to carry on business as ship builders and ship repairers in all branches.

The A. A. Plumber Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $25,000, to carry on business as foresters, timber merchants, loggers, sawmill proprietors, etc.

The Harrison and Lamond Shipbuilders Limited, has been incorporated with capital stock of $100,000, and head office at South Vancouver, B.C., to carry on business as builders of ships, vessels, and boats of every kind.

The Undine Logging Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as timber merchants, sawmill, shingle mill, pulp mill and paper mill owners, loggers, lumbermen, etc.

The plant of the Rainy River Pulp and Paper Company at Port Mellon, B.C., has commenced the production of kraft pulp. The company report that a second unit is being planned and that construction work upon it will be commenced immediately. This will double the present capacity of the plant.

The Quality Lumber Yards, Ltd., have been incorporated with head office at Winnipeg, Man., and capital stock of $10,000, to carry on business as manufacturers of and dealers in lumber and timber of all kinds. Among those interested are H. S. Y. Galbraith, E. P. Hayden, R. H. Attridge and T. W. Robinson, all of Winnipeg.

Sealed tenders are being received by the Minister of Lands for B. C. until the 9th day of July, 1917, for the purchase of License X975, to cut 1,445,000 feet of cedar and fir on an area situated on two separate areas adjoining Timber Sale X616, Hotham Sound, New Westminster District. Two years will be allowed for the removal of the timber.

The planing mill, box factory and cross arm factory, together with the greater part of the machine shop belonging to the Cameron Lumber Company, 355 Garbally Road, Victoria, B.C., were recently destroyed by fire. The loss is estimated at $100,000. The insurance was small. The fire was caused, it is believed, by a hot journal box. Only the absence of wind enabled the firemen to save the mill yard in which there is a valuable stock of lumber.

Mr. J. T. Paxton, receiver for the British-Canadian Lumber Corporation, Vancouver, B.C., which has extensive timber holdings and three mills, has received the permission of the Supreme Court to report to the shareholders and noteholders the absolute need of further financial assistance if a forced sale of the assets is to be avoided. Mr. C. B. Macneill, K.C., explained to the court that the holders of the receiver's certificates and the bondholders were represented in London, England, by a committee and that they had a scheme for reorganization to take advantage of the improved condition of the lumber market. In 1915 permission was given to raise $550,000 on receiver's certificates. Of this approximately $437,000 had been received and disbursed in meeting pressing claims. Only $62,000 in cash remained in the hands of the liquidator, over $51,780 in license fees fell due in July and there were some $166,240 in arrears. An effort is now to be made to convince the bondholders that it will be wise to continue to finance the estate.

Douglas Fir Masts for all U. S. Ships

Specifications have been issued by the United States Emergency Fleet Corporation for the spars and masts for the wooden vessels which are to be built on the Atlantic, Gulf and Pacific Coasts for the United States Government. These spars and masts are all to be of Douglas fir. Each vessel will be equipped with a foremast, a mainmast and eight cargo booms. The foremast will be 72 feet 6 inches long, 8 inches in diameter at the top, 18 inches in diameter at the heel and a maximum diameter of 23 inches. The main mast will be 86 feet long. The booms will be 42 feet long, 9 inches in diameter at the top, 12 inches mid-diameter and 10 inches in diameter at the base. It is expected that 600 of the larger size and 2,400 booms will be required.

Pulpwood from Newfoundland

The Newfoundland Legislature, now in session, is expected to enact a law permitting export to the United States of a considerable quantity of pulp wood. This was intended for shipment to England and France, but, because of the shortage of ships, its transfer to those countries has become impossible.

The Corbet Automatic Steam Towing Machines

MADE IN CANADA

Made in four sizes, from ¾ in. dia., to 1½ in. dia. Steel Hawser.
The most complete and up-to-date Towing Machine on the market to-day.
We have installed a large number of these machines on the Atlantic and Pacific Coasts and Great Lakes, and not one of our customers regret having bought our machines.
It is automatic, making it impossible to part the Hawser and lose the tow in rough weather.
Will make money for its owner by not having to purchase new Manilla Towing Hawser every Spring.
Also by saving time during the operation of the tug.
Keeps the crew contented.
Allows the tug to be operated with reduced crew.

A Good Belt Saves Money

THE money wasted in keeping a stretching belt taut amounts to a surprising figure. If you use "Goodhue Belts" in your mill or factory you can save most of this money because "Goodhue Belts" stretch less by 15 to 25 per cent. than any other belt. They are made from skillfully selected hides with the stretch taken out of each section before it is made up into the belt.

According to the conditions under which the belt is to run, we recommend "Extra," "Standard" or "Acme Waterproof" belts.

Send for further particulars and prices.

The Time You Buy Needs "Watching"

Lloyd George says: *"Time is the deadliest of all the neutral powers.*
"Time is the most powerful factor of the war."

And we say time is the most vital factor in our industries. When you hire men you buy their time; now how do you record it?

The International Recorder is the only safe and sure method known on the market to-day. It gives you the original pay-roll entry PRINTED.

The employee makes the record of his time himself—if he is late or "Out Early" the red entry warns him. If on pay day he is "Short," he knows why and who to blame,—himself.

What is the difference between the labor you purchase and your PRODUCTIVE labor? The difference is overhead burden, which has wiped out the profits of many a firm.

There is an International for every business—let us submit our time recording plan.

WHOLESALE LUMBER

Eastern Spruce

Hemlock

Pine

Shingles

and

Lath

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir

Red Cedar Shingles

Hard Pine

Maple Floors

Shipment by car, canal boat or cargo.

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

Lower Oil Bills

Mix a little Flota Mica in your oils or greases and you will be surprised how much it will improve the lubricating qualities. Virtually the equivalent of a 90c. oil can be produced from a combination of a cheap oil and some Flota Mica. The largest power plants are using Flota Mica and getting wonderful results.

Send for particulars. Fill out the coupon.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

CLIMAX Improved Geared LOCOMOTIVES FOR WOOD AND IRON RAILS

A 62-ton Climax Locomotive Designed Especially for Heavy Logging Work.

GRATON & KNIGHT

Standardized Series LEATHER BELTING

Tanned by us for belting use

GRATON AND KNIGHT

Are you trying to drive Pulleys with a Belting Specification?

How often does a belting specification get you the kind of belts you really should have? Do the belts you get agree with the specification? How many men in your mill could tell—Could ***you?***

The only specification the belt buyer should attempt to make is a specification of the work to be done. Because to get the work done most efficiently and economically is the only possible reason for any kind of a specification about anything.

Graton & Knight offer you this practical specification—the work to be done. To do the work properly in every case is the basic idea underlying the Graton & Knight Standardized Series Leather Belts.

This Series was evolved to fit the working needs of actual conditions, ***not*** to meet theoretical conditions as described on paper. Every belt in this Series—and there is one for every saw and planing mill drive—has been standardized only after it has been ***proved*** right.

Face these facts squarely—then consider the safety, ease and economy of buying Graton & Knight Standardized Belts. Not by guesswork, nor on discount—but on ***standardized performance.***

Write for a description of Graton & Knight Belting Standards and a copy of their Book on Belting.

HAVE YOU OUR CATALOG?

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

FIRE BRICK

Each brand is specially suited to a separate use. We have the experience to manufacture and supply the finest grade of Fire Brick for the varying uses of the Lumber Industry. The same brick may not meet the requirements of your Dutch Oven and of your Refuse Burner.

This is a product that should have your most careful attention. When so much depends directly on the successful operation and dependability of Fire Brick in your plant, it will repay you many times to make a most careful investigation before the installation. Let us show you where our product has been successfully used for years. Let us suggest a special brand for your particular purpose.

We have an interesting catalogue that will be sent you. It will give you an insight into the proper methods of Fire Brick construction.

PRIVATE PHONE EXCHANGE MAIN ST.

East Toronto June 17/10

Chapman Double
Ball Bearing P/C

Dear Sirs

In regard to double ball bearings supplied by you, we find those on line shaft giving entire satisfaction and find them quite a saving on power, as for the ball bearing loose pulleys, they are decidedly the finest, and only satisfactory loose pulley we have ever had, no noise or heating and consequently no loss of time, which so frequently occurs with the ordinary loose pulley, we have run the loose pulley on our big matcher for nearly two years and consider it a severe test and it runs as nice to day as the first day we used it can recommend your bearings and pulleys, to any one in the manufacturing business especially planing mill work which we have proved.

Yours very truly
L. A. DeLaplante Limited
per W. Graham Supt.

Chapman Double Ball Bearings

have been installed in over 3000 factories of all classes during the past fifteen years, and the above letter is one of many of a similar import, bearing testimony to the efficiency, long life, and cleanliness of the bearing. Some of these have been compiled in a booklet, "Results", which we will be pleased to send on request.

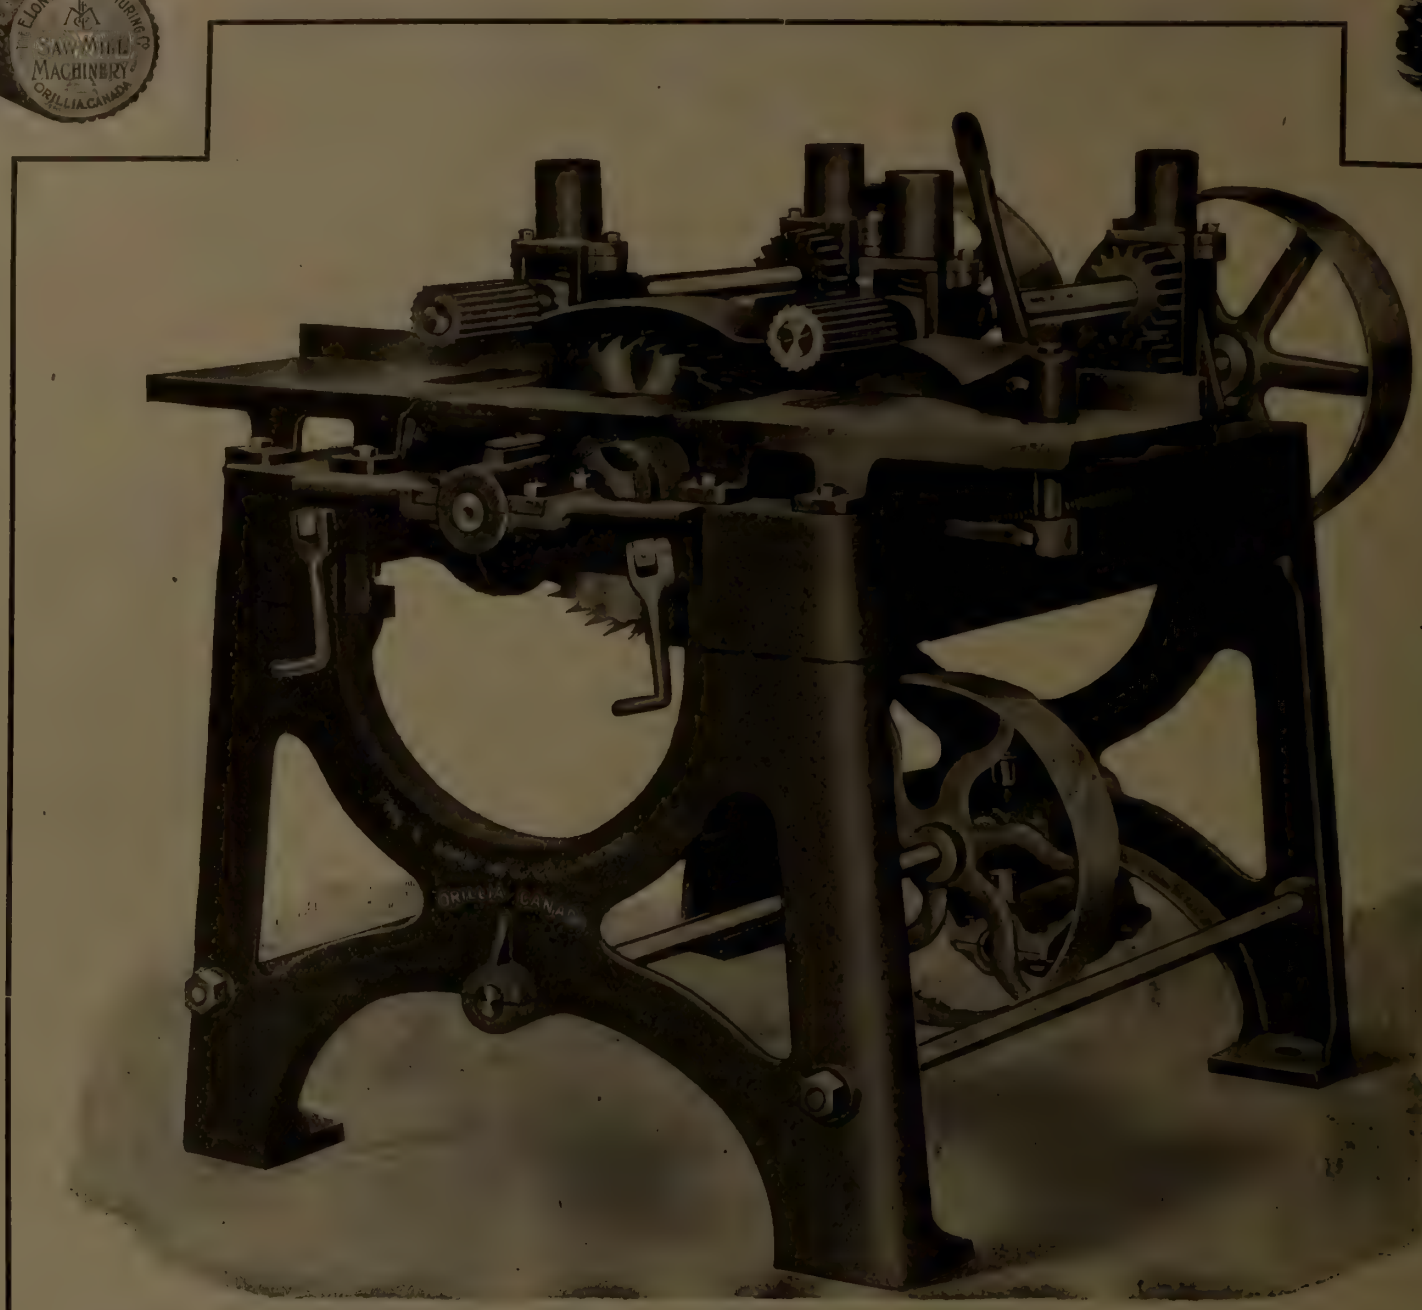
Transmission Ball Bearing Co., Inc., 1050 Military Road, Buffalo, N. Y.



No. 3 Lath Machine

For the mill, whose requirements call for an enormous output, we recommend our No. 3 Lath Machine.

Designed primarily to work in conjunction with our No. 4 and No. 3 Bolters. The well known capacities of these Bolters, both in quantity and quality, will give you an idea of the product turned out by our No. 3 Lath Machine.

Covering a period of years, we have placed these Lath Machines in all parts of Canada.

The reputation they have established has led to repeat sales in the majority of cases where increased capacity was desired.

Simple in construction, strong in frame and bearings, with all parts easily accessible for adjustment, our No. 3 Lath Machine is without doubt the leader in this field.

Floor space, 4 feet x 4 feet 6 inches.

Weight, 1,600 pounds.

Maximum power required, 15 H. P.

The E. Long Manufacturing Co., Ltd.

Orillia - Ontario

An Edger for 6" Cants

You can put a 6-in. cant through this edger and know that it will come through edged to a hair. Edger carries 22-in. saws, 6-in. saw collars, leaving 7-in. clear saw blade, more than enough margin for 6-in. stock

Mandrel is 3⅞-in. in diameter, the three bearings that support it are each almost 10-in. long—the rest of the machine is built in proportion. That's why Waterous New Champion Edgers can be crowded to the limit and will turn out full capacity, day after day, without straining.

Notice the feed rolls, two before and two behind the saws. They are machine fluted to give a firm, secure grip on the timber that holds it fast, but will not mar it in any way.

We build up-to-date Machinery for Sawmills of every capacity—circular or band

Catalogues on request

The press rolls are divided, too, making both sides of the machine independent of each other. It's a worth while feature, decidedly.

WATEROUS NEW CHAMPION EDGERS

are built with 40", 48", 56", 60" and 72" opening. They carry as many as four movable and two stationary saws without difficulty.

These edgers cut true and to dimension at all times. The guides are rigid and cannot shift in the cut. They are crowded to correct position and held immovably in place by a steel setting gauge that drops upon them. *No other edger has this feature.*

Waterous New Champion Edgers are fast and accurate cutting, easily operated, and perfectly safe. We stand behind every machine we turn out.

Hundreds are in use in mills all over Canada where quality of sawing is a main consideration. Bulletin No. 113 describes them fully.

The Waterous Engine Works Co., Ltd., Brantford, Canada

$5,000,000.00
worth of mixed metal sold annually.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station;** packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c**, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Factories also at:— New York, N. Y. London, Eng. St. Louis, Mo.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

Better Belt Surface

The Dodge Standard Wood Split Pulley

The Wood Split Pulley is better than either cast iron split pulleys or steel split pulleys for the following reasons—

The wood pulley is lighter, stronger, better balanced, and provides a very much better belt surface. It costs 33 1-3% less money and provides 50% more returns in horse-power value. It may be run at very much higher speeds with no danger of bursting—also it may be had quicker and in a greater range of sizes.

It costs less to get—less to put on—and less to keep.

We make approximately 300 Dodge pulleys every day—everybody uses them.

There are more Dodge pulleys making ammunition than any other kind—you can get them quick.

Every pulley is thoroughly nailed. Every pulley is guaranteed for Double Belts.

We are Canada's greatest pulley makers.

FOR SALE

Standing Timber

in Large or Small Blocks

and

Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery For Sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.
1 Double cylinder steam nigger, right hand.
1 Log Loader for right hand mill.
1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.
1 left-hand steam nigger.
1 Log-loader.
1 Endless chain jack ladder with two kickers complete for right and left hand mills.
2 Roger Gang Edgers for 8-in. cants and lumber.
1 Waterous double edger, 6 saws.
1 2-saw Trimmer.
1 20-ft. Slash Table.
1 16-ft. Revolving Slash Table
1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.
1 Lath Mill with bolter.
2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.
5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
2 125 h.p. Water Wheels.
1 Upright Engine for sawdust conveyor.
1 10 h.p. Engine.
1 Wood Machine for 22-in. wood.
1 Edger for ripping dry lumber, installed.
1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

Safety-First Light Speed Car

We have placed this car on the market because of an urgent demand for a car light enough for one man to handle easily, and yet strong enough to carry two to four passengers with luggage or material. The frame is made of 2x1x3/16 inch channel steel. Length of car platform 5 ft. 1 in. Width of car platform 4 ft. 3 in. Wheels are 16 in. pressed steel, brakes on all four wheels. Weighs approximately 450 lbs. One man can easily put it on or off the track anywhere. Engine is a 2½ H. P., reversible and free running. This car can conveniently be used by timekeepers, logging foremen, superintendents; in fire patrol service, etc.

Price $125.00 complete, ready for service.

We also make larger cars equipped with engines rating from 4 to 12 H. P. and ranging in price from $160.00 to $500.00.

Handle Lumber for DISSTON SAWS made in Disston Mill

Portion of Apple Logs in the Disston yards ready to be sawn into boards from which saw handles will be made

Carload after carload of logs come into the Disston plant almost continuously to be made into handles for Disston Hand Saws and parts of other Disston Tools.

These logs are sawn into boards **in our own saw mill.**

Thus, not only are Disston mill saws constructed along scientifically correct lines, but they are constantly subject to practical test in the Disston plant.

Well made saws thoroughly tested are the saws for economy and satisfaction.

The Invariable Choice of the Man Who Knows

Yates No. 91 Matcher with Automatic Feeding Table in Brooks-Scanlon mill, Bend, Oregon.

A Great Lumber Company that has operated mills for the past two decades—whose activities have extended

into nearly every great lumber producing region, and whose experience includes the manufacture of lumber from practically every variety of timber—should be a mighty good judge of real merit in planing mill machinery—***And when that company after purchasing not less than fifteen Yates Matchers during the past ten years, selects a***

Yates No. 91 Planer and Matcher

for its latest operations in the famous new lumber center at Bend, Oregon, there must be something exceptionally meritorious about Yatès Matchers.

The name of the Brooks-Scanlon Lumber Co. is as familiar in lumberdom as that of Carnegie in the iron and steel industry. Read what Mr. J. P. Keyes, general manager of Brooks-Scanlon interests at Bend says about the latest Yates No. 91 Planer and Matcher, shown above:

Bend, Oregon, August 22, 1916.

Gentlemen:

In reply to yours of the 18th, we are pleased to state that the No. 91 Matcher is giving excellent results in surfacing stock two or four sides at a feed of 250 feet per minute and in running pattern stock, such as shiplap, drop siding, etc., at 150 lin. feet per minute. The machine has been giving us no trouble in operation and its work, at the speed mentioned, is, we think, beyond criticism.

Yours truly,

BROOKS-SCANLON LUMBER COMPANY,
J. B. Keyes, Gen. Mgr.

To P. B. Yates Machine Co.

Note particularly that Mr. Keyes reports that the "91 gives us no trouble in operation." That means a lot in the operation of high speed matchers, where every minute's delay means hundreds of feet loss in production.

Write for our circular "No. 91." It tells why the "91" is the best buy in the matcher field.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 **Toronto, July 15, 1917** **No. 14**

The Proposed Freight Rate Increase

The fact that the Interstate Commerce Commission of the United States, after making a thorough enquiry, has decided to refuse the railways of the country permission to make a flat rate increase of 15 per cent. in freight rates, ought to carry some weight with the Dominion Board of Railway Commissioners, who have a similar request before them from the railways of Canada, and it also ought to give those who have been inclined to permit the Canadian railways to make the increase under certain conditions, reason for considering whether their views should not be revised. Possibly the conditions in the two countries are sufficiently different to make such an advance advisable in Canada, but not so in the United States; though many lumbermen and other business men doubt it. The most reasonable point of view to adopt in Canada seems to be that the railways are starting at the wrong end. They are asking for an extensive increase, but are giving practically no assurance of relief to the long-suffering public who are paying practically two prices for everything they consume to-day, largely on account of the inability of the railways to handle the country's traffic.

What the people of Canada would like to have before paying such a radical increase of freight rates is an assurance that the railways intend in the future to act otherwise than they have in the past, when they milked the public as dry as they could and starved the transportation services of the country. It is notorious that the equipment of the Grand Trunk Railway and the Canadian Northern Railway to handle the traffic they are designed to handle, is absolutely inadequate, and that for this reason we are facing in Canada to-day a coal famine and a great food scarcity. Should not the Dominion Board of Railway Commissioners devote their attention first of all to securing from the railways an assurance to be depended upon that this unbearable situation will be remedied, before attending to their request for increased freight rates? If the freight rate increase would actually improve the situation, many Canadians would be willing to grant it, but we have no assurance of this nature. Nothing short of a statement from the Railway Commission that the railways have been bound hand and foot to increase their equipment and ability to handle the country's traffic should put the people in a frame of mind to agree to an increase in freight rates. Unpleasant as the idea seems to many Canadians, the sentiment in favor of public ownership, or at least public operation of the railways of the country is increasing rapidly to-day, and will increase more rapidly, unless the railway companies can bring forward proof that they are dealing with the problems they now have to face, in a manner which will give promise of early relief.

The railway problem in Canada is a large one, complicated by the most unfortunate history that it is possible to conceive, yet surely it is not too big a problem for the people of Canada to solve. If the Railway Commission, not able to compel the railway companies to give us relief from the anxieties we feel to-day, it is either in need of greater powers or new blood.

It is hard to appreciate the point of view of some eastern Canadian business men, who have expressed an opinion in favor of allowing the railways to charge the increased rates. Probably they looked at the matter for too short a time before expressing their opinions. Probably also, they were so upset by their long series of troubles with the railways that they concluded too hastily that it would be well to try the increases out, in the hope that it might help the railway companies to catch up with the business. In view of all the failures of the railways in the past to cope with the growth of traffic, it is the most unlikely thing in the world that even with the increased freight rates they would make any better showing so far as the shipping public is concerned, and many lumbermen who have not given their acquiescence to the idea are convinced that it is the duty of the railways to give good proof of their ability and intention to remedy matters, before considering their request.

In the United States, the situation when the request for increased freight rates was first made, was rather similar to that in Canada to-day. It was pretty nearly the unanimous belief at first that the railways would have no difficulty in obtaining the advance. The lumbermen of the west coast, however, laid the matter so forcibly before the Interstate Commerce Commission that it was persuaded that the railway companies were not entitled to the increase. The case presented by the western lumbermen was so conclusive that there is now a general feeling that the United States railways will not make another attempt to increase the rates.

The Cost of Replacing Stock Sold

There ought not to be any two opinions regarding the proper basis of figuring the cost of a certain stock of lumber or of any other goods that are to be sold, but it frequently happens nowadays that many a firm which thinks it is selling its goods properly, is really disposing of them at a loss, because it is figuring the cost of the actual goods which are being delivered, instead of figuring on what it will cost to replace them. Now and then you will hear someone say that he thinks the dealer is not entitled to raise the price of goods that he has in stock when the market price advances, but the same man will see the matter in quite a different light when the market is on the decline. If he is a purchaser he will hold out stoutly for the benefit of the drop in price, and if he is a dealer he will find that, in nine cases out of ten, he is obliged, by the customer's knowledge of market conditions, and by the activity of competition, to lower the price. If the dealer is to get the heavy end of the stick on a declining market, he is entitled to the other end when prices are going up, and if he does not make a point of charging sufficient for his stock to give him a profit upon what it will cost him to replace it, he will be making nothing to protect himself against the loss of the periods of falling prices.

Conditions in the trade to-day, make it of vital importance to apply this principle in price quoting. Advances in price have taken place so rapidly of late in some cases, that the dealer who does not consider the cost of replacing his stock may find that he is losing in more ways than one. If the volume of trade that can be carried on with a given amount of capital is reduced in proportion to the in-

creased cost of the goods which he has to purchase, and if he is not obtaining enough to enable him to replace what he has sold, he will be gradually freezing himself out of business, as well as profits. The crux of the situation is the fact that when prices are being revised downward the dealer has no choice. This ought to be his guide when prices are advancing. Competition is the real factor, and it obliges him to give the consumer the benefit of the drop. He may be able to replace his stock later, at an even lower price, but in the meanwhile he is losing his profit on the one transaction, and if he continues doing business in this way he will find that some day, when prices strike bottom and commence to advance again, he has been doing business for nothing and is in a bad way to face the new conditions of the rising market. The matter is one of simple business arithmetic, but it is often overlooked by men who ought to know better.

Consideration of this point brings out another, namely, that a fluctuating market, whether it is going up or down, is a difficult one to handle. Some people will do well out of it and others will not, but the greatest average success in business will be achieved during times when prices are steady. It is better for all concerned, that the manufacturer, the wholesaler and retailer should know fairly accurately how much they can count upon receiving for their stocks, and that the consumer should know equally well how far he can make his money go. Business is encouraged by such conditions, whereas consumption, upon which business depends, is restricted to a considerable extent, by uncertainty in the price situation.

To-day, every lumberman is thinking more or less frequently of two things, first, his present transactions, and second, the situation which he will have to face when the war is over and the business world turns its course towards normal peace activities. Men are all trying to analyze that situation in advance, as far as they can. There is a pretty general impression that lumber will suffer less in the way of reaction than most other lines, because of the fact that there will be an immediate and world-wide demand for it for reconstruction purposes, and because the restricted output during the war will have enabled most producers and dealers to enter the peace period with comparatively small stocks purchased or produced at high prices. The needs of Europe will be so great that there is likely to be ample time for anyone to get safely out from under any load of high priced stock that he may be unfortunate enough to carry when prices commence the return trip toward a normal level. The very fact that this turn in the tide is expected as an inevitable result of the return to peace, is one reason which should awaken those who are not basing their present prices upon the cost of replacing their stock. Even though the transition to normal conditions may be slow, it is none the less certain, that only a sound method of price quoting will put a man in a position to enter the new situation safely.

This is not an argument in favor of price boosting or an attempt to discourage the trade in regard to the outlook, but is an expression of ideas that have impressed us in conversation with many lumbermen. Basing prices upon the cost of replacing stock is just as sound a business principle as that of figuring one's profit upon the selling price, instead of the delivered price. It is just one of those matters which have a way of appearing to be less important than they really are, until one comes face to face with their consequences; and upon which it is possible to come to grief very rapidly, unless one adopts invariably the only safe and sensible viewpoint.

Business and Patriotism for the Retailer

Economy is the order of the day, and many a line of business is feeling the adverse effect of the necessity which falls upon everyone to revise his standards of living so as to make his money go as far as possible. There is such a thing, however, as economy which defeats its own purpose, and one of these is the refusal to spend money which would increase one's capacity either to produce or to serve. It is a duty incumbent upon all of us to-day to see that not only in our savings, but in our spendings, we serve the public as well as our own private interests, to the best of our ability. Increased production of foodstuffs is being urged, and the farmer is doing much to meet the exceptional strain put upon him and his resources. Short-handed as he never was before, he is finding it difficult to produce, harvest, store and ship the increased output that the sountry requires from him. There are not many directions in which the lumberman can assist the farmer in this crisis. Production, harvesting and shipping, are largely problems of labor and equipment, with which the lumberman has little to do, but when the question of storing the output of the farmer comes up, the lumberman becomes a factor. To store the great output of grain and other crops that will be produced this year in Canada, will require greater facilities than most of the farmers of the country possess, even in those well-settled parts of the country where the farmers are well equipped for handling their production during normal years.

In former years, most of the grain production of the Canadian West has found its way to the markets of eastern Canada and Great Britain, almost direct from the fields to the markets. A stream of cars and vessels, transporting it across the Canadian Prairie and over the Great Lakes, has made it possible for the farmer to count upon disposing of his product without spending much upon storage facilities. To-day the situation is greatly changed. Lake tonnage is very scarce, principally because suitable vessels have been transferred to ocean traffic, and the vessels which are left upon the Lakes find such a great demand for their space for the shipment of ore, that as a grain carrying fleet, their usefulness will be much reduced. The railways, besides, are overtaxed and under-equipped for handling the heavy traffic of to-day. Even if the transportation facilities of the country were given over in their entirety to the moving of grain, munitions, and other materials required on account of the war, it would be impossible this year for them to move the western grain crop, as it has been moved in former years. Inevitably much of it will have to be stored to await transportation at a later date. In a large measure the same conditions will prevail in Eastern Canada.

What sort of shape are the farmers of Canada in for such a development? Undoubtedly they must spend a great deal of money upon building storage facilities if they hope to protect their crops until the railways and steamships can move them. The retail lumber dealer has a duty to perform in this connection, which fortunately for him is also a good business move in his own interests. Present conditions point to a crop of greater than average proportions, and even with normal transportation facilities this could not be moved this year in time to avoid storing much of it, for some months at least. Do the farmers realize this now? Probably many of them do not, and the retail lumber dealer ought, whenever he can, to show the farmer that the country requires him to put up storage buildings. It is a duty as well as an opportunity for the retail lumberman to busy himself along this line. What will it profit the country if the farmer raises a great crop this year, and a portion of it is allowed to perish because of inadequate storing facilities? For the retailer, therefore, there is a definite line of business and a patriotic duty to-day. He should direct his attention to the farmer as he never did before. He should talk the matter over with every farmer he can; discuss with him his bin room, granary equipment, silos, and storing facilities generally, according to the nature of the crops that are being raised in his neighborhood. As a means of preserving the food supplies of the nation, well-planned storage buildings, constructed of wood, should play a great part during the balance of the war.

Under present conditions it should be an easier matter than usual to induce the farmer to see matters in this light and to spend money upon lumber. Everything the farmer reads, whether in his newspaper or in his farm journals is preaching the same lesson to him. His mind is pretty well prepared in advance for the ideas that the retail lumberman will put to him, and if he is expecting a large crop he is almost certain, in nine cases out of ten, to have become anxious already about how he is going to take care of all of it until he is able to get it shipped. The time never was more opportune for the lumber dealer to help his neighbor and his country as well as himself.

B. C. Office at Toronto Closed for the Period of the War

The office of the British Columbia Lumber Commissioner at Toronto, has been closed, probably for the duration of the war. The lumber trade of Ontario will regret greatly that the British Columbia Government have found it advisable to take this step and will hope that, in the near future, conditions will warrant the re-opening of the office which has been of great service to the trade. Under the direction of Mr. L. B. Beale, the British Columbia office at Toronto has not only given the Ontario trade a good idea of the excellent qualities of B. C. forest products, but has established their use quite firmly among Ontario consumers. Not the least of the many benefits developed from the work of the B. C. Commissioner at Toronto has been the improvement in the business relationships between the west and the east. In fact, the work of the Commissioner has been so valuable in many important directions that it can scarcely be doubted that the British Columbia Government will re-open the office at the first moment when they consider that conditions justify them in doing so.

Canada's Forest Products Industries

In a paper read recently before the Canadian Society of Civil Engineers at Montreal, Dr. John S. Bates, superintendent of the Forest Products Laboratories at McGill University gave a general survey of forest products in Canada. While there was nothing that can actually be termed new in the address, it contained an interesting review of the whole situation. Canada is considered the third country of the world in value of forest resources, Dr. Bates said, Russia coming first and the United States second. Canada's present supply of merchantable timber is only one-fifth or one-fourth of the supplies still available in the United States.

In the list of Canada's natural resources agricultural field crops hold the first place in value of production with an estimated total of from $700,000,000 to $800,000,000 annually; forest products come second with at total of about $175,000,000 for the primary products and this figure is considerably increased if paper and other manufactured products are included. In 1916 the exports of products from wood amounted to approximately $100,000,000, not including the minor proportion of specially manufactured wood articles showing the place which our forest resources will take in helping to overcome the war debt. According to the census of 1911 the capital invested in timber and re-manufactures amounted to $259,889,715 in 4,999 establishments, this being the highest figure on the list. In addition the paper and printing trades accounted for an invested capital of $62,677,612 in 773 establishments.

By far the most important and extensive utilization of wood consists in the manufacture of lumber and other products by mechanical processes, whereby the wood still retains its identity. Under the heading of wood used in the rough, firewood takes first place, and in value accounts for about 30 per cent. of the primary wood products. The annual normal consumption of railway cross-ties in Canada is about 20,000,000, with an average value of about 45 cents each.

The annual consumption of round mine timber is over 53,000,000 linear feet with a total value of $524,000, while the mines consume sawn timber to the extent of 23,000,000 feet board measure, valued at about $304,000. The term lumber is used to include a wide range of material and constitutes the most important manufactured product. A large proportion goes directly from the sawmill into general building and construction without passing through an intermediate woodworking factory. In 1915 the lumber cut in 3,239 mills totalled 3,842,676,000 feet board measure with a total value of $16,919,806, which includes a good deal of structural timbers.

Special mention should be made of the by-products of the lumber industry, since they constitute an enormous amount of wood material which for the most part is now going to waste. Utilization is retarded in Canada on account of the scattered population and limited markets, as well as the technical nature of many of the processes. It is estimated that the logging waste which is left in the woods represents about 25 per cent. of the original tree. Obviously the opportunities for utilization are limited and the main problem in Canada at present is to enforce rightly the proper burning of slash in the wet seasons to remove this serious fire hazard and leave the woods in better condition for second growth.

Sawmill waste amounts to about 40 per cent. of the original tree, so that the finished lumber on the average represents from 30 to 35 per cent. of the tree. New developments in the utilization of wood waste are being made continually but it is false economy to handle waste unless the by-product industries can be carried on at a profit. Effective utilization calls for a variety of chemical and mechanical processes which must be adapted to the form, species and quantity of wood waste available at any point. Slabs, edgings and trimmings represent 15 to 17 per cent. of the tree. Sawdust accounts for another 11 per cent. A recent development is the use of spent hemlock bark for mixing to the extent of about 30 per cent. with rag stock in the manufacture of roofing felts. Experiments on its use in wallboard, industrial pails, conduits and wall-paper give promises of success.

An extensive portion of the address related to the pulp and paper industry, the distillation industry and minor industries. Canada now has a total of 90 pulp and paper mills, many of which are large and of modern design. The export figures for the calendar year 1916 show that pulpwood, wood pulp and paper produced have increased in value to nearly $50,000,000, or about half of the total export value of forest products, with the exception of the small proportion of specially manufactured articles.

Colonial Lumber Company Arranges for Its Cut

In a letter to the Canada Lumberman, under date of July 6, the Colonial Lumber Company, Ltd., Pembroke, Ont., say:

"The insurance on our sawmill which was recently destroyed by fire amounted to $76,000. The mill was very well insured, although, of course, the loss was severe at this time of year, owing to our losing the season's work at our plant. We had been running about four weeks, and had cut about 3,500,000 feet at the time of the fire. The mill was just getting warmed up in good shape for a season's work. All efforts to find out the cause of the fire have been fruitless. An investigation was held by the insurance companies, the fire marshal, and ourselves, but failed to develop anything that would give us a line on the cause.

"Arrangements have been made with the Pembroke Lumber Company whereby we turned our crew over to them. This enabled them to run day and night shifts, and they are to cut not less than 10,000,000 feet for us this season. We are letting through three or four million feet of logs, to be delivered at R. & T. Ritchie's mill at Aylmer, P.Q., where we expect we will saw the greater portion this year. Ritchie's mill is now running on Colonial logs, and will probably have a million or two million feet out before they run short, awaiting the next supply of logs. Mills along the river are offering to cut logs for us next season, 15,000,000 to 20,000,000 feet altogether.

"As to our rebuilding, we find it very difficult to purchase machinery under present conditions, and the prices asked are extremely high. The labor situation is another problem to be reckoned with. We hope we may be able to rebuild, but whether we will make a start this year or not has yet to be decided on."

Twelve Months' Foreign Trade in Lumber

Canada's imports and exports of wood manufactures of wood during twelve months ending March 31, 1917, and 1916, were valued as follows:

		1917.		
Imports.	1916.	Total	From Un. Kingdom.	From Un. States.
Unmanufactured—Fence posts and railway ties.	$ 645,606	$ 808,641	$.....	$ 808,641
Logs	325,967	598,417	.....	598,417
Lumber	3,584,980	4,617,010	5,261	4,599,959
Other manufactured wood	903,552	1,185,174	8,023	1,158,205
Manufactured — Furniture	778,387	1,019,336	37,484	941,220
Wood pulp	406,749	651,311	.....	651,311
Other manufactured wood	1,977,181	2,609,872	320,483	2,138,497
Exports.				
Unmanufactured—Logs	$1,078,999	$ 824,155	$ 69,954	$ 753,688
Lumber—Deals, pine	1,249,595	1,574,279	1,454,461	105,476
Deals, spruce and other	9,677,355	10,340,039	8,594,803	290,158
Laths	2,246,777	2,008,068	416	2,002,227
Planks and boards	23,880,341	25,976,526	2,316,849	21,497,341
Scantling	1,535,731	2,389,294	1,244,345	815,104
Shingles	3,644,159	4,047,232	.....	4,007,092
Shooks	460,681	545,194	454,917	4,832
Other lumber	658,334	682,664	300,147	282,478
Pulp wood	5,743,847	6,448,189	.....	6,448,189
Timber	478,409	325,192	280,631	38,345
Other manufactured wood	548,742	703,707	67,980	626,136
Manufactured — Furniture	397,226	344,418	57,332	33,292
Wood pulp, chemical	6,801,011	14,032,920	2,677,923	11,107,819
Mechanical	3,575,537	6,371,133	379,488	5,487,424
Other manufactured wood	725,099	564,709	359,517	120,453

The dates for holding the ninth session of the Pacific Logging Congress have been set for October 18, 19, 20, the meeting this year to be in Seattle, Wash. An excellent program is now under preparation.

Give Good Service and Advertise It

A Strong Example of Service Publicity, Together with Some Striking Thoughts About How to Render it Successfully

When you read something in these columns about "service" does it generally appeal to you, or do you say to yourself that the editor is working the "service" hobby overtime? Much as the "service" idea has been discussed here and elsewhere, probably only a small portion of the trade have got its importance and its real elements properly fixed in their minds. The smallest part of service is that of providing a well-stocked yard and delivering the goods ordered. The greatest part is the use of the personal element in such a manner as to create in the customer's mind a fondness for doing business with you. Personal favors may be one of the factors, but the less they appear in the garb of favors and the more in the garb of something to which the customer is entitled the greater their drawing power will be. It is a difficult matter to specify the elements of this business-drawing in so many words, but recently it was put forward strikingly by C. H. Ketridge in the Mississippi Valley Lumberman, in the course of one of his inimitable talks to retailers. The best way in which we can tell our own feelings on the subject is to repeat his remarks.

There is so essentially a practical side to "service" that, in developing it, a retail lumber dealer should bear in mind continually its value as a subject for use in advertising. There is not much sense in doing a lot for your customers and at the same time running an advertisement in the local paper consisting of your name and address, followed by the words "Lumber, Lath and Shingles." If you are doing all you can to help your customers to get the best value out of what you sell, you owe it to yourself and to prospective customers to talk about it in advertising, designed to impress the reader with the fact that a firm's "service" is something valuable to him. The accompanying advertisement is one of a series published in local newspapers by a progressive retail firm which has established a far-reaching reputation for giving good value in both goods and service. We intend to reproduce a few other examples of the same firm's advertising in later issues. "John Doe," of course, in the advertisement is a substitution for the real firm's name, they being too modest to desire publicity of this nature.

Farmers Appreciate Service

In his article on "Service" C. H. Ketridge writes as follows:

"A good share of my life has been spent on the farm and living in country towns, and I know how much the country folks appreciate a kindly personal service by a business man, and when you run across a lumber dealer who is getting the biggest share of the business in the town you may know that it is by reason of his being always willing and ready to do a personal service to anyone who needs it and do it voluntarily and without asking. I have known of several such men. They were not much on education or the knowledge of keeping books. They didn't even know the cost of doing business. You couldn't tell them by their dress from one of the yard men, but, all the same, they drew men to them and held their trade in spite of all competition. It was not what we call "modern service" that they gave, but it was a service of the heart, and the whole community shared in it. Business service is all very well, and valuable as far as it goes, but there is a service apart from business that is worth far more and brings more business than the other kind. It comes from a personal attachment to the dealer. It is made up of the little things in the human equation and the kindly touches of a personal interest. It is something that distinguishes a business man from what we call 'a good mixer.' Many are 'good mixers' in a certain way, but they lack that quality which causes men to give them the confidence of friendship and love them for their qualities of the heart.

"I have in mind a good illustration of this in the person of an employe in one of the large retail yards in this locality. His position was the outside soliciting agent for the yard. I have met him several times. There was nothing in his personal appearance that was particularly attractive or striking. In manner he was very quiet and unassuming, but when he talked in that soft, low voice of his I couldn't help but feel the charm of his personality. The first time I met him was one day when I was on an exercise hike and he came along in his machine and stopped and asked me to take a ride with him. He knew who I was, but he was a stranger to me. Afterwards I called at the office, and when he was there he was more to me than the manager himself was, because I found he had a broader knowledge of men and of selling lumber than the manager had. I never heard him say an unkind word of anyone, nor a word that was a 'knock' at a competitor. A few weeks ago I was shocked to learn of his sudden death and burial at his former home in a little country town.

"A fellow-employe in the office met me on the street and told me this, and forthwith began to tell me of Joe's ways of getting and holding the trade. Every carpenter and contractor knew him and was his friend, because of his kindly manner and ready disposition to do them many little favors that were not particularly in the line of business. If he knew of a poor workman who lived several miles from his job he would stop at his house and take him there in his machine. Sometimes he would take the carpenter's children along for a ride and bring them back. Lots of little favors he did the contractors, also, that he really was not obliged to do. He never sold them a bill under any false or tricky representation. As a consequence he controlled a large amount of non-competitive trade which came to the yard because of his personal influence and reputation among the contracting and working men in the building business. The common people loved him, and that is the most appropriate epitaph that can be placed over his grave. He was not known in public life, nor was his name spoken of in the papers, but he was the real head of the yard of which he was subordinate employe. Such a man is not often recognized at the time for his real worth to the business. He earns his salary many times over, but he does not think of this, nor do his employers appreciate it to the extent of raising his salary.

"There are some country yards where the second man has more influence for the drawing of trade than the owner or manager has, and this is by reason of their kindly ways and doing little kindly actions in a voluntary manner, which, in a way, they are not obliged to do. Farmers drive to the yard because 'Bill' or 'Jim' is there, and they

John Doe Service Means Something

JOHN DOE SERVICE is the big word that the folks of this community and for miles around are appreciating more and more every day. JOHN DOE SERVICE means more than mere barter. We do not and will not take your hard earned dollars and simply give you mere merchandise in exchange. If that is all we were in business for, we would lock up and throw the keys away. Most any concern can give you mere merchandise in exchange for your money. That is not the JOHN DOE LUMBER Co. aim and never will be. We go a great deal further than that. Our service is one that really serves, that gets down to brass tacks with buyers of lumber and building material. Our service paves the way for the scientific and economical purchasing of supplies. We show the ways in short cutting expenditures. We explain to you the modern methods of buying. We study your building needs, we assist you in giving you facts and figures in building estimates. We explain how to purchase what you need and to eliminate what you don't need. We give you first quality merchandise in accordance with your specifications. Our service really serves and you may share in its many advantages 365 days in the year. Bring your building problems to us. Let JOHN DOE SERVICE help you solve them. You will be surprised. You will be delighted. It's the modern way of modern progressive business by a bristling and modern progressive Lumber Company.

John Doe Lumber Company

know they will be waited on in a pleasant, agreeable way. He helps the farmers' wives out of the wagon and puts their things in a safe place while he puts the load in. He is the friend of everybody, even the fellows in the other yards, and would do them a favor, too, if it came to his hand.

"In every yard or place of business there is some one individual who is the principal attraction to the people who trade there, whether it be the manager, owner, or a subordinate employe, and it all comes from the exercise of sympathetic understanding and willingness to oblige. As I've remarked before, this is a heart service, and is recognized by everybody, but, strange to say, not everyone is capable of giving it, because they are not temperamentally so inclined. It is not their nature to be unselfish. This, however, does not prevent them giving what is known now as business service. Every merchant does this, in a more or less effective way. And it is in the further development of this kind of service that lumbermen to-day are being educated. But heart service and business service should be combined as much as possible. The latter may create business, but the former will draw it to the yard and hold it.

The Public Abuse of Service

"Some few weeks ago I made mention of the tendency of the public to abuse the service rendered by the business men. Such service as free delivery, loaning and exchanging of goods, extending credits, and other things relating to service given to customers for the purpose of attracting and keeping their patronage. In giving this service we must always reckon on the fact that it will be abused, because it is human nature to take an undue advantage of what is offered without cost. Everybody won't do this, but you can depend on a percentage of people who have this element of human nature developed in a larger degree than others. But this kind of heart service I have spoken of is rarely taken advantage of by anybody. One peculiarity of giving a service is that at first it is regarded and appreciated as a favor, but after a time it gets to be an old story and a common thing to do. The public comes to regard it as a right which the business man is bound to give as a part of his business, and therefore it is not construed any longer in the light of a favor. One of our modern business maxims is 'The customer is always right.' Everybody who has to do with the retailing of merchandise to the public knows that only a part of this is true, and the merchant who adopts it knows this to be a fact. In reality he only assumes the customer to be always right for the purpose of advertising his liberality in doing business. It is a pleasant fiction for 'soft-soaping' the public. Like everything else of the kind, however, the general pubilc has to pay for those who are not 'always right.'

"Not long ago I was in one of our local department stores, and I asked the manager if he had ever estimated how much the abuse of service cost him in a year's business. His reply was that it cost on the average $9,000 per annum, and it was figured in as one of the items of the cost of doing business, which, of course, meant that the patrons of the store had to pay for it. In some of the large stores in Chicago it runs over $100,000 a year, and it was increasing at such a rate that steps have been taken to modify the false assumption that the customer is always right in making a lying statement to the store.

"I have sometimes wondered how the privilege of taking home lumber and returning it would work with the lumber dealer. Some of you know how it is when you loan lumber for holiday celebrations, dancing floors for the boys at picnics, and for other similar uses, and there is a shortage when returned, but the boys will swear it was all that was brought out. You know, again, the claims for shortage on bills you have delivered, when you are positive you checked out the right amount when it went from the yard. How often is the customer right in these cases? How often is he right when he claims you must have made a mistake in weighing his coal, or that he is sure he has paid you some on account which you have not credited him for?

"I believe it's the right thing for a dealer to do when he discovers an error he has made to rectify it, whether the customer knows of it or not, but I don't think he should allow himself to be imposed upon by false claims when he knows that they are false. I think he should do all he can to clear up any alleged mistakes, and make it plain to the customer he is in error. I never could stand for anyone trying the grafting game on me, and that is what most of this abuse of service amounts to. You lose your respect for anyone who tries it on you, and when people find you are 'easy' they lose their respect for you. Every merchant at heart knows that the customer is not always right. It is only the scramble for business that has formulated such a false assumption, and somebody has to pay for it."

O. F. Bryant, of the Forest Products Laboratory of Canada, was a recent visitor to the Forest Products Laboratory at Madison, Wis., and evinced a deep interest in the work so far undertaken. He predicted that in a very few years Canada would be supplying the United States with all of its supply of newsprint paper. He says Canada has the cheaper wood and the cheaper power.

The Enquiry Corner

Answers to Questions by Readers
Can We Help You?

Ontario Terms of Sale and Grading Rules

Editor Canada Lumberman:— Sault Ste. Marie, Ont.

Will you kindly advise me regarding the usual terms of sale used in Ontario from manufacturer to wholesaler, and to retailer? Also, can you advise me where to procure a copy of the hemlock and white and Norway pine grading rules as used in this district? Herbert E. Stiles.

There is no uniformity of practice in regard to terms of sale in Ontario between manufacturer, wholesaler and retailer. Most of the wholesale lumber dealers, however, are now allowing 2 per cent. 30 days, or 90 days net. Some will not sell except on the basis of 2 per cent. 15 days; and a few wholesalers are demanding net 30 days.

Between the manufacturer and wholesaler the terms in use are even more varied than between the wholesaler and retailer. In fact, they are entirely a matter of bargain, even the date of settlement not being fixed. Some mills require settlement on December 1; others on January 1, and many of them on January 15. Usually a 2 per cent. discount on shipments and final settlement is allowed.

There are no official grading rules for hemlock, white and Norway pine in Ontario. A set of rules that have been pretty widely commended was drawn up in 1912 by a few Ontario lumbermen and submitted at the annual meeting of the Canadian Lumbermen's Association by Mr. W. J. MacBeth. These rules were discussed, but not adopted. They are embodied in the report of the Association for that year and a copy may possibly be obtained from Mr. Frank Hawkins, Secretary of the Canadian Lumbermen's Association, Castle Building, Ottawa. There has been quite an enquiry for these copies, however, and they are almost out of print now.

Personal Paragraphs

Mr. Joseph G. Mayo, former assistant general manager of the Mattagami Pulp and Paper Company, Smooth Rock Falls, Ont., has rejoined the company as assistant to Mr. S. R. Armstrong, general manager.

George E. Harrison, manager of the Vancouver, B.C., branch of the Merchants Bank of Canada during the past twelve years, has joined the Whalen Pulp and Paper Company, which controls interests on Swanson Bay and Mill Creek, B.C. Mr. Harrison will act as comptroller of the organization.

Mr. Robert Cox, the well-known lumber exporter of Ottawa, visited Toronto early in July. In conversation with local wholesalers he stated that stocks of spruce at Liverpool are very low. His own stocks there consist only of a few 3rds, all the 1sts, 2nds and 4ths having been disposed of. Mr. Cox looks forward to the development of a great demand for Canadian spruce as soon as the British Government removes the embargo upon its importation.

The Harris-Brooks Lumber Company has been incorporated under the laws of Mississippi, with head office at Meridian, Miss. Those interested in the new company are:—Frank H. Harris and W. H. Harris, of the Frank H. Harris Lumber Company, Toronto, and C. K. Brooks, of Meridian, Miss. The new company will deal in yellow pine. They will open a yard at Meridian, where they will carry extensive stocks. The chief object of the company will be to develop trade in the United States, which will enable them to dispose of stocks that they cannot sell in Canada. By this means their purchasing operations will be greatly facilitated, as they will be able to handle a much wider range of grades than was possible when catering solely to the Canadian trade.

No Fifteen Per Cent. Freight Increase in the United States

The Interstate Commerce Commission of the United States has suspended the tariffs advancing freight rates on United States railroads approximately 15 per cent. throughout the country. The commission declares that no showing has been made by the railways that they are in need of the added revenue. The admission was made that the Adamson Act, granting increased wages to railway employees, had not materially increased operating costs on Southern and Western lines, but had made the increased revenue necessary on the Eastern lines. The only increases granted were to Eastern and Southern roads on coal, coke, and iron ore, and on some of the class rates. A great factor in the determining of the case was the statement presented before the commission by Pacific Coast lumber shippers, showing that the railway companies were not entitled to the advance.

Timbers Used in Aeroplane Work

Silver Spruce and Ash the Most Useful—Oak Quite Out of the Running—Hickory Good for Skids

The construction of aeroplanes, though given a wonderful stimulus by the war, is still far from being standardized. Materials, sizes, designs, etc., are undergoing frequent alteration, though the varieties of wood used are becoming settled to a considerable extent. The practice in Great Britain is outlined in a discussion of the subject recently published by The Cabinet Maker, which says:—

The majority of constructors, even those with the best scientific and technical training, started with very little knowledge of the physical properties of various kinds of timber, and although many of them had mechanics supposed to be familiar with the merits and demerits of some woods, the information to be obtained from even the most intelligent worker lacked precision.

The timber merchant with even a smattering of knowledge of mechanics and physics can at once see that most tables as at present compiled give but doubtful aid to the designer. The values given are generally too precise. The compilers have attempted to tabulate tests on timbers as if they were embodying results of tests on metals, so that mathematically inclined constructors may in designing wooden parts be led to credit the tables with equal definiteness and validity with regard to ash, say, as with respect to steel.

As a rule, in tests on timber of small dimensions, "perfect" timber is used—"perfection" here meaning absence of knots; obviously it would be stupid to compare a knotty piece of ash with a perfect piece of elm. Since no timbers with knots should be used in aeroplane building, the tables at first sight appear to give true relative values for the various woods.

The natural fallacy which besets the engineer used to calculations in metals is the unconscious assumption that all perfect specimens of timber are monologous. This is by no means the case. A flawless piece of ash sawn from the outside of a tree will differ in specific gravity, tensile strength, elasticity, resilience, etc., from a piece of the same log sawn nearer the heart, and both will differ from timber riven instead of sawn. Timber sawn from young trees would differ in some respects from that obtained from older trees grown in the same locality. Timber only partially seasoned gives different values from timber "bone dry." Again, ash grown on a sandy soil differs from that grown on a clay or chalk soil; that grown in a coppice from that in an open field; that grown at a high altitude and bleak aspect from that in a lower and more genial position.

Tables of tests, therefore, are to be handled with caution, but the writer wishes most emphatically to say that it would be quite wrong to assume that the coefficients of strength set out in most tables in text-books are too high. In some cases the strength of certain timbers in proportion to their weight seems to have been calculated from poor specimens.

Tables would be more valuable and information could be more readily accumulated for future research if they were supplemented with full descriptive notes as to the place of origin, size of original log, when logs were felled, interval between felling and sawing, how long in stick after sawn, position of test pieces relatively to the heart. This information, of course, is only obtainable when timber is obtained from a first-class firm which purchases solid logs, and converts into planks, which are then seasoned in the open air before they are placed on the market. It is obtainable now. Such information was not sought for, nor was it readily obtainable, years ago, when tests were made from which tables in certain text-books were compiled.

In many kinds of hardwoods thick planks are never perfectly seasoned in the centre. If thick planks were used as material for tests, then if such planks were re-sawn into thin boards and allowed to season for a year, different ratios of strength to weight would be found on further tests. The differences would be greater in some woods than in others; thus they would be more marked in oak than in pine.

It may be said at once that no country in the world is better able than Britain to supply timber specially suitable for aeroplanes. In no land is the timber trade so well organized as it is here.

Two important points should steadily be borne in mind: (1) That timber is mainly a natural growth and therefore varies with all the many factors affecting growth, and (2) that time is an essential factor in proper seasoning.

Aeroplane builders must have the very best timber. If the ten best stocks are taken away from a pile of one hundred stocks, the whole grading may be upset; the pile which was formed for a certain class of trade may become of doubtful value for that trade and would have to be sold for some other purpose. It is more difficult for a first-class firm to dispose of "skimmed" stock than it is to sell fair average stock.

If, and when, the dimensions of the timber required in aeroplanes can be classified within reasonable range, special arrangements can be made whereby sizes in new and suitable woods can be prepared near the sites where the logs are felled, but no one can foresee that day.

The smaller the dimensions asked for, the greater the choice of timber for quality.

A well-known aeronautical firm telephoned an urgent order for ash, length 2A by width 2B. Out of a pile of 1,600 planks in the requisite thickness only four yielded the dimensions asked for. When the writer came in he was told of the order, and he saw at a glance that no aeroplane required planks of such a width and length combined. He therefore 'phoned up to the firm and insisted upon speaking to the works foreman, who actually would use the timber, and it was found that the largest finished size required was A by B. The idea of the clerk ordering the timber was to get planks of such a size as to cut up economically for two or three different sizes—a kind of least common multiple arrangement. Now, every plank (and there was 1,600 in the pile) would yield A by B, and therefore the practical choice for quality was 400 times greater than the apparent range as prescribed by the purchase in the first instance.

Silver Spruce.—This timber can be obtained in lengths from 10 to 32 feet, widths from 9 inches to 20 inches. The thicknesses of the imported planks are 3 in., 4 in., 5 in., and 6 in. It is an excellent wood for aeroplane construction, on account of the straightness of its grain, its lightness, and the long lengths obtainable. This timber is quite different from the Quebec spruce and from the European spruces.

Ash.—Square-edged ash imported from America runs from 8 to 16 feet long, and 6 inches to about 20 inches in width; the narrow planks are more suitable for aeroplane work. As the Yankees very often put their wood into the kiln to dry, it is preferable to use the log ash sawn in England and dried in the open air. The lengths obtainable run from 10 to 28 feet, but by far the greatest proportion are from 10 to 18 feet only.

It is much more difficult to obtain ash straight in the grain for a good length than it is to procure silver spruce absolutely straight. Further, there is a greater variation in the properties of ash than there is in those of silver spruce. When designers, therefore, have the option of specifying silver spruce or ash, and they can afford the extra bulk (with its attendant increase of head resistance) to bring the strength of spruce up to that of ash, it would seem prudent to prefer the former, especially as the ash is 75 per cent. heavier. But, of course, where resilience is of importance the latter should be used.

Hickory.—This wood is imported in logs which are sawn in England. The lengths run from 12 to 28 feet; the great majority of the logs are from 12 to 20 feet. Although the best hickory is stronger than the best ash, yet it is a wood which varies considerably, and it is doubtful whether, on the whole, in practice, weight for strength it has any advantage over ash. It is extremely tough, and is probably the best wood for skids. It should not be used in hydroplanes, as it is subject to rot in water. The heart wood in hickory is of a brown color, whereas the sap wood is white. This point is mentioned because, to an outsider, strips cut from the sap would appear quite a different wood from strips cut from the centre.

Kauri Pine.—This timber has been used by several people in aeroplane construction. Lengths can be obtained up to about 35 feet, and widths up to 24 to 30 inches can be supplied. Kauri pine has an attractive appearance and is easy to work. The writer, however, would not recommend Kauri pine at all for aeroplane work; it is extremely liable to warp, is heavier than silver spruce, and certainly inferior to it in its physical properties.

Elm.—Rock elm can be obtained in logs of long lengths, and is no doubt a very strong wood. One cannot recommend it for aeroplane construction, because it is usually sold in solid logs for the customer himself to saw and season; although this does not matter in shipbuilding work, where there is a constant demand for it, it is a drawback in an industry where design is not let settled and, therefore, stock cannot be put on one side to mature. Further, rock elm appears to have an advantage over ash in strength and other physical properties. Ordinary English elm is quite unsuitable.

Poplar.—The native poplar used in France is a very feeble wood. Yellow poplar imported into England from America runs from 8 to 16 feet long, 6 inches and up wide, in square-edged boards. It can be obtained in thicknesses ⅜ in. up to 4 in. This wood, although better than French poplar, is somewhat brittle.

Mahogany is used by two or three constructors. This can be supplied from 12 to 26 feet in length. The logs are usually sawn in England and seasoned in the open air. Thicknesses range from ⅜ up to 6 in. In working out designs it should be borne in mind that the actual thickness of mahogany is a saw-cut less than the nominal thickness. Weight for strength, mahogany is supposed to be a highly efficient wood, and it is also valuable in that it is not affected by water. If carefully chosen it should be a very good wood for aeroplane work. There are many varieties of mahogany in commerce and, therefore, selection should be made by a man with knowledge.

Yellow Cedar.—Yellow cedar is a timber which is imported

square-edged, 8 to 16 feet long, thickness from ½ in. to 3 in. It will not rot in water, and hence is highly suitable for hydroplane floats. It is a fairly cheap wood also, and therefore can compete favorably with mahogany.

Parang.—This is a species of mahogany which is much more fibrous than Honduras mahogany, about 75 per cent, stronger, and weighs about 3 lbs. per foot cube more than Honduras. It also bends well. Lengths 10 to 18 feet, widths 10 to 16 inches, thicknesses ½ in. up to 5 in. It has been used for dirigible propellers.

Oregon Pine.—This timber can be obtained in huge baulks; the writer has come across lengths 107 feet long. For most purposes at present it does not present any advantages over other woods, but may, of course, be useful later on when dimensions are altered, or conceivably it might be used in dirigibles. Silver spruce beats it in straightness of grain and lightness. Ash seems superior in strength.

Teak.—It may be as well to mention this timber. It is a highly suitable wood for work in hot climates. Teak is imported in logs and planks, lengths from 6 to 30 feet; usually running in planks 6 to 20 feet long, 4 to 20 inches wide. The weight of teak is from 45 to 55 lbs. per cubic foot. There are several varieties.

Walnut.—In aeroplane work walnut is used chiefly for propellers.

Black walnut is imported from America; lengths 8 to 16 feet—the great majority 8 to 10 feet—in square-edged planks; widths 6 to 18 inches. This wood is rather narrow, anything over 12 inches wide is costly. The thicknesses imported are from ½ inch up to 6 inches. Walnut is a faulty wood, and hence perfect specimens, such as are required for aeroplane work, are expensive.

French walnut (thick stuff) is imported in the natural shape of the tree. The lengths run from 6 to 12 feet, but only a small percentage go over 8 feet. Widths from 8 inches to about 20 inches. The planks are not squared, and the thicknesses are nominal; that is to say, a saw-cut has to be allowed for.

Satin Walnut.—Satin walnut has been used by one or two people for propellers, but the writer is surprised to find this, because it is a wood that warps horribly, whereby, of course, the propeller loses greatly in efficiency. Satin walnut is a wood that splits easily.

Oak.—It is a curious thing that oak, which for centuries has been one of the staple woods for shipbuilding, is not used in aerial navigation. The explanation, of course, is that other woods are stronger, weight for strength, and that there is a greater range of timbers available for commerce now than there was in the days of the wooden ship.

The peculiar virtues of oak—its durability, stiffness, and resistance to decay when buried in the earth—have little value for such aery, flexible, and transient structures as aeroplanes. If it were desired to preserve a few aeroplanes for a thousand years, then the Monarch of the Forest might condescend to provide chests for the Flinders Petrie of the thirtieth century to unearth. No lesser purpose will enrol the Royal Oak in the army struggling for supremacy in the air. Content with giving man secure victory over the raging deeps below, it leaves to lesser timbers the joys of bearing man aloft to wrestle with the winds.

Lumbermen's Sons at Vimy Ridge

Perry Robinson, war correspondent with the British headquarters in France, has paid a pretty tribute to the lumbermen's sons who fell at the great Canadian victory at Vimy Ridge. He says:

"On the summit of Vimy Ridge there is a little group of white-painted wooden crosses, marking the graves of the Seaforth Highlanders of Canada, who fell in the capture of the ridge. These Canadian Seaforths were mostly British Columbians. A long, long way they came to die, the long-limbed sons of Victoria, Vancouver, New Westminster, and Nanaimo. Some came even farther, for they came from the far-off slopes and peaks of the mountains of the upper waters of the Fraser River when they heard the call.

"There could be no prouder burial place than this ridge which they won so splendidly.

"One knowing the British Columbia of bygone days stops to look at these graves. It is the old British Columbia that leaps to mind, with its great reaches of unbroken forest. If one had his way he would plant this Vimy Ridge with trees brought from British Columbia, and let these men, when the present wooden crosses are replaced by a noble and permanent monument, rest under the shadow of a grove of their own pines, firs, and cedars."

No less than 200,000 tons of wood pulp are said to be stored at Swedish ports awaiting sale or shipment. Much of the pulp held in storage has been bought and paid for by British dealers, but cannot be delivered owing to the Swedish embargo on shipments of wood pulp to that country. American buyers have abandoned their efforts to purchase wood pulp in Sweden. The Swedish Government now requires a guarantee that Swedish pulp exported shall be used in the country to which it is first shipped.

Increased Pacific Coast Operating Costs

In the Canada Lumberman of July 1st an interesting article was published giving an analysis of the cost of producing lumber on the Pacific Coast. The figures given referred to Oregon mills. Further reference to the same subject is contained in the West Coast Lumberman of recent date, in an article dealing generally with the costs at Washington mills, and containing a striking summary of prices of supplies of many kinds, which are used by lumber manufacturers and loggers. The mill supplying the figures is located in Western Washington and gives reports for May, 1915 and 1917, which show that practically everything has advanced in price. The increases, reduced to a percentage basis, are as follows:—

	May, 1915	May, 1917	Increase Per Cent.
Labor	2.00	3.00	50
Belts	50-10% off list	40% off.	33 1/3
Shafting, 2 15/16	3.25 per 100	7.35	126
Wire Rope	60% off list	20% off	100
Files, 8 in.	.84 doz.	1.93	129
Brass Bushings	.35	.45	28½
Castings	.03½	.05	43
Red Oil	.16	.19	19
Black Oil	.07	.11½	64 1/3
Gasoline	.10	.18½	85
Powder	9.50	12.00	26 1/3
Saws (Head)	4.05 per ft.	7.70	90
Cross Cut Saws, 7½ in.	6.60	8.91	35
Emery Wheels	60% off	45% off	25
Lath Yarn	.08½	.21	147
Commissary Supplies			
Butter	.26½	.38	43½
Eggs	.18	.34	89
Beef	.11	.14½	32
Spuds	25.00	85.00	240
Beans	.05¼	.17¼	228
Bacon	.16	.35½	122
Ham	.16½	.27½	66 2/3
Flour	6.40	13.50	111

Referring to these figures the company say:—"You will note from the above that the increase runs all the way from 19 to 240 per cent. and that we have not picked out merely a few items that have increased in price, but have picked them at random and we think this is a representative list.

"You will note the item of labor has increased 50 per cent. In addition to this actual 50 per cent. increase we are paying in money, we find that our crew is about 25 per cent. less efficient than two years ago. It is impossible to keep a steady crew and we are constantly breaking in new men. These men are not only inefficient in themselves, but they reduce the general efficiency of the entire crew.

"As to the matter of supplies, a crew that is constantly changing will not take the same care in the use of supplies as will a steady crew of men who have been on the job a long time, hence there is considerable waste here, adding to the cost.

"As to the commissary supplies, the biggest increase in cost is here. It is necessary to provide better board now than ever before and we are unable to charge the loggers a sufficient increase to offset the rapidly rising cost of supplies."

Radical Change in Maritime Province Conditions

A despatch from Bangor, Me., published in the latest issue of the American Lumberman says:

"A radical change in business conditions since last fall is reported from the Canadian Maritime Provinces. Then business was brisk, the harbors crowded with shipping, and Halifax, St. John, and other centres swarmed with soldiers. Now the men in khaki are gone, the erstwhile busy ports all but deserted, and business is suffering a reaction.

"From April to December, last year, when the British and French deal trade was booming, all the New Brunswick and Nova Scotia lumber ports were packed with shipping, and prosperity was at high tide. Now the bottom has fallen out of that trade and the lumber movement has almost ceased, for although there is a brisk demand for spruce from the United States there are few vessels available, even at the unheard-of rates of $5.50 to $6.50 a thousand.

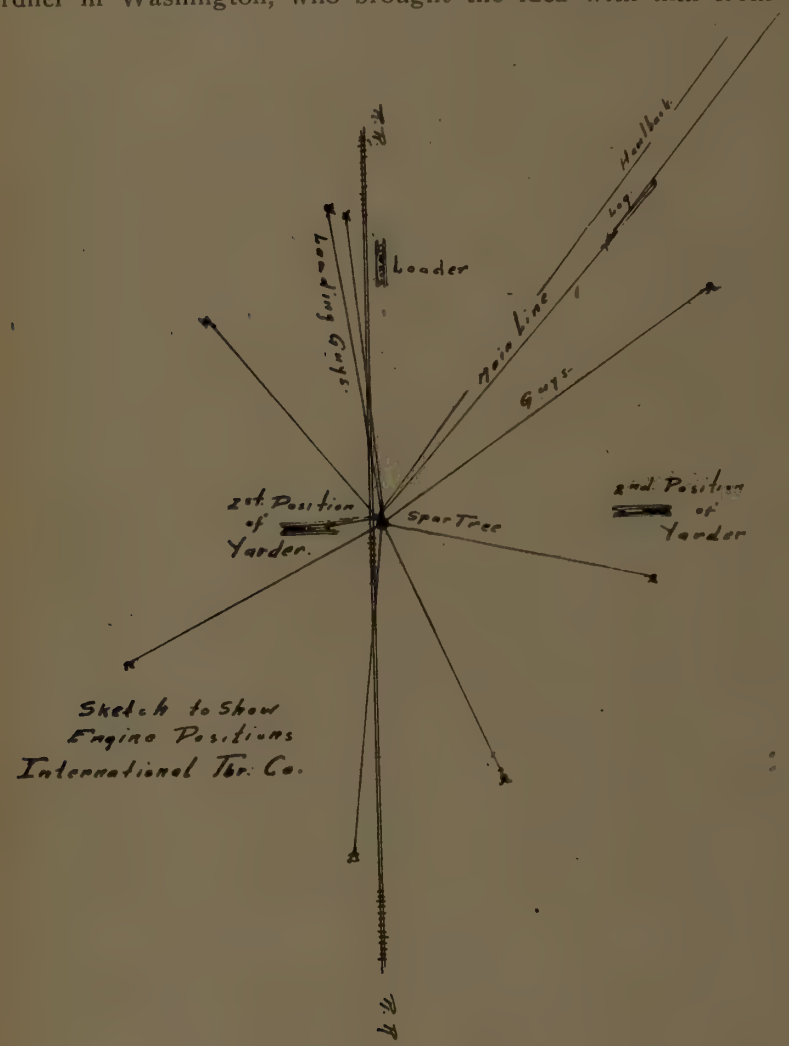
"Although shipyards are busy, construction has not kept pace with destruction. By early fall the provinces will have the beginning of a new fleet, but even in Nova Scotia, where they build them of native spruce and are not too fussy about the finish, vessels cannot be created overnight. Since the United States entered the war Uncle Sam is in high favor. The Canadians yell themselves hoarse at sight of the Stars and Stripes, and nothing is too good for an American."

High-Lead Logging Widely Used in B.C.

Western Camps Find Method Introduced in 1907 a Valuable Solution of Yarding and Loading Problems—Description of the System

During the past year or so a great deal of attention has been given by Coast loggers to high lead yarding. Although the "high lead" is an old system, having been used in the South for twenty odd years under the name of the semi-portable skidder, and now practically abandoned in favor of the "portable pine logger," and the various forms of cableway skidders, it never until the past couple of years has been used extensively on the Coast.

The first high lead on the Coast was used about 1907 by H. B. Gardner in Washington, who brought the idea with him from the



Sketch to Show Engine Positions
International Tbr. Co.

South. In British Columbia James McNaughton used the first high lead at the camp of the Canadian Western Lumber Company, Comox, in 1913. During the past two years the system has spread to nearly every camp in the province. Operators welcomed it as a means of getting away from the difficulties of ground yarding, with its rocks and stumps, and roots and mud, and heavy rigging; without the great expense and cumbersomeness of the cableway skidder. As the use of the high lead spread the system rapidly became improved in its details by the logger and the equipment manufacturer. Special high speed engines were produced, special loading engines to care for the increased yarding capacity, and specially efficient blocks and other rigging.

Until recently the yarding and loading has been carried on by the same machine, or by a yarder and a loader operating as one unit, or as two units operating at the same time. Not long ago, however, one of the large B. C. companies made what seems to be a further improvement in the complete separation of the yarding and the loading. As this has proven very satisfactory, we will describe at length the operations of the International Timber Company, where it is used in order that loggers on the Coast may judge of the suitability of the system to their own operations.

The International Timber Company operates on Vancouver Island, British Columbia, back of Campbell River. They own some thirty thousand acres, of which about twenty-five thousand acres are still uncut. The country is in general rolling, of a gravel formation, and of such nature that the logging spurs can generally be placed with regularity and within nine hundred feet of the stump. The timber is principally Douglas fir, averaging about 1,500 feet to the tree and 40,000 feet to the acre. By reason of the quality of the timber and market conditions it is logged in full length. The plan of logging is as follows: The branch roads are put in and the yarding settings laid out so as to secure forty acres at a setting. The equipment consists of five yarders, three being 10 in. x 11 in. Willamette compounds, one a 12 in. x 14 in. Willamette compound, and one an Empire 11 in. x 14 in. four drum high lead; but while having five yarders only four yarding crews are employed, the extra engine being rigged ahead by a rigging crew, so that no lost time occurs to a yarding crew when through with a setting. Four separate loading engines are employed, two being 10½ in. x 10¼ in. Washington compounds, and two Empire 10 in. x 11 in. duplex. Three loading crews only are employed, the extra loading engine being moved by a rigging crew, as with the yarders.

In operation the yarder has two locations at each spar tree, as per sketch. All the timber on one side of the track is yarded and decked at the spar tree (see pos. No. 1). The yarder is then moved across the track behind the pile and the timber on the other side of the track is yarded. High spar trees are desirable to permit a high rather than a large pile The pile being between the engine and the work, the engineer operates entirely on signal. As high as four million feet has been yarded to one pile. The "Toots-E" electric whistle is used. The setting being completed, the yarding crew moves to another yarder, and the rigging crew moves the yarder to another setting. The spar tree rigging (guys, blocks, etc.) is not disturbed but is left for the loader. A loader is now brought in by a rigging crew and placed in position ready for a loading crew when it completes its last pile. The loading is done by a system developed at this operation; it might be called a "duplex haul-back" system.

The merits of this loading system are that it permits long logs to be handled easily and quickly; and as many logs are necessarily left one hundred or two hundred feet from the track, a haulback is necessary. The system was worked out with the Washington compounds, having a crotch line on the main drum and a spreader, the haulback line being attached at the crotch. In loading, the log being brought into position over the car, it is lowered on the friction if a small log, and by "bleeding" the cylinders of a large log. This system of loading worked out so successfully that two special 10 in. x 11 in. Empire duplex loaders were installed. With this loader each loading line is controlled in either direction by its separate engine; while the lower engine carries the haul-back drum.

Each yarding crew consists of eight men; each loading crew of five men; the rigging crew of four men. Eight complete sets of rigging are necessitated by this system of rigging ahead. By separating the yarding and the loading, the output per man has been materially increased, the cost decreased, and a regularity of output assured, which, of course, affects favorably the costs of railroading and booming.

Logs yarded by high lead system. (International Timber Company, Ltd.)

An average output of three hundred thousand feet per day is now secured by this camp; which, considering the timber conditions, the thirteen miles of main line, the difficulty of booming, and the average number of men employed (only one hundred and seventy-five) speaks well for its efficiency.

E C. Rector, Vancouver, is general manager of the company.

Wood Preservation Shows Increase

Greater Quantity Treated in United States During 1916 than 1915—Construction Timber Shows a Decrease

In 1916 a total of 150,522,982 cubic feet of wood was treated by the 117 treating plants which were active during the year. This is 9,664,019 cubic feet, or 6.9 per cent. more than the 140,858,963 feet of material treated by the 102 plants which reported in 1915.

An increase of 383,783, or 2.5 per cent. was recorded in the number of cross-ties treated during 1916 over the number reported in 1915, while the quantity of piling treated was more by 3,382,448 linear feet, or 36.3 per cent. A gain of 852,171 square yards was also made in the quantity of paving material treated, while the number of cross-arms was greater in 1916 than in 1915 by 145,559, or 99.5 per cent. The largest increase occurred in the number of poles treated, which amounted to more than twice the number reported during the previous year. In only two of the seven classes of material covered by the report were decreases registered in the quantity treated. The items consist of construction timber and miscellaneous lumber and the amounts given fall short of the 1915 figures by 3,119,819 and 913,509 board feet respectively.

The quantity of preservatives used by the industry during 1916 in the treatment of the 150,522,982 cubic feet of wood reported amounted to 90,404,749 gallons of creosote and refined water-gas-tar, 26,746,577 pounds of zinc chloride, 5,675,095 gallons of paving oil and 582,754 gallons of miscellaneous preservatives. The amount of creosote and refined water-gas-tar used was greater in 1916 than in the year previous by 9,545,307 gallons, while a decrease of 6,523,027 pounds was recorded in the consumption of zinc chloride.

Preservation of Ties

Since the wood-preserving industry in the United States has been built very largely upon the treatment of railroad timber, principally ties, this class of material constitutes the bulk of the total quantity of wood treated. In 1916 there were reported a total of 150,522,982 cubic feet of material subjected to preservative treatment, of which 112,408,104 cubic feet, or over 75 per cent., were ties. The actual number of ties treated was 37,469,368.

The quantity of piles treated in 1916 amounted to 12,690,867 linear feet, or 3,382,448 linear feet more than are shown by the figures for the previous year.

It is probablbe that as many more poles are subjected to some kind of preservative treatment as are reported by the treating plants. Such treatment, however, consists practically altogether of dipping or painting (brush treatment). Since this report includes only those poles which were treated in cylinders or open-tank plants, it does not cover material of the kind first referred to. The number of poles treated in 1916 was 328,517, or 202,461 more than were reported in 1915.

Preservation of Paving Blocks

The quantity of paving material treated in 1916 shows an increase over the 1915 figures of 852,171 square yards. The total for the year was 3,788,541 square yards. The percentage of increase was greatest in the Pacific Coast region, where 414,884 square yards were treated during 1916 as compared with 66,552 in 1915. The Interior Eastern and Southern Coast regions also contributed to the increase with 317,572 and 334,095 square yards respectively. Where 1,000 square yards were reported by the Interior Western region in 1915, none was treated in that region this year.

Yellow pine blocks were first in importance, the quantity treated being nearly six times the total number of all other species combined. Douglas fir blocks ranked second with a total of 409,569 square yards treated, followed by 220,955 square yards for tamarack, 6,849 square yards of Norway pine, 6,098 square yards of western larch and 4,400 square yards of sugar maple.

Preservation of Construction Timber

The material included under this heading consists principally of bridge timber, switch-ties and other heavy structural material. The total amount of material of this class which was impregnated with preservatives in 1916 by the treating plants of this country was 138,889,222 board feet, a decrease from the quantity reported in 1915 of 3,119,819 board feet.

The largest quantity of cross-arms was treated by the plants of the Southern Coast region, the number reported being 197,103, or an increase of 75,158 over the number treated in 1915. A marked increase occurred in the number of cross-arms treated in the Pacific Coast region, where 64,267 were run through the cylinders in 1916, or more than 12 times the number reported in the year previous. The total number reported by all plants was 291,778.

The material included under this heading consists of mine props, tunnel sets, dowels, tie plugs, drain boxes, shingles, pipe staves, signboard lumber, fence posts, factory sub-flooring, conduits, trunking and capping, cattle guards, dead men, pole steps and miscellaneous lumber and planking. The total amount of this class of material reported was 13,024,000 board feet, or 913,509 board feet less than was treated in 1915.

Public Are Great Paper Wasters

The Dominion Conservation Commission has sent out a circular requesting manufacturers, retailers and consumers to save and conserve paper.

"All available sources of information report shortage in raw material for woodpulp," says the commission. "Recruiting for the forestry and other battalions has taken many woodsmen out of the country, and during the past season the cut of wood has been very much below the average. The demand for Canadian woodpulp is rapidly increasing. One of the more important factors is the cutting off from the United States of the supply from Norway and Sweden, owing to lack of shipping. The heavy sale of newspapers, with news of the war, has also greatly increased the demand for paper. The Canadian and United States Governments have enabled the newspapers to secure their supply of paper at a price which they can afford to pay. Without this action many of them would no doubt have been compelled to cease publication.

"Canadians are wasting an enormous amount of paper daily. Very small indeed is the supply available for reclamation compared with the amount distributed daily by the newspapers alone All of this paper, if saved, could be used again for other purposes, such as the making of building papers, boxboard, roofing felts, filling for pasteboards, etc., thus relieving the shortage of new materials.

"With the scarcity and increased cost of pulpwood the public should make every effort to assist. Much can be accomplished by saving waste paper, and various organizations have had good results. In one day eight schools in Winnipeg turned in 5½ tons of old paper to the Red Cross Society. This achievement can be repeated all over Canada. In many of the smaller places schools could combine their collections. Boy Scout or Girl Guide troops could collect and deliver to a headquarters, or collecting boxes could be placed at street corners, where the public could deposit parcels of old papers. Through the use of collecting boxes in Ottawa the Daughters of the Empire are securing 35 tons per month. All qualities of paper can be used; newspapers, books, magazines, manila or kraft wrapping, cartons, etc. Numerous organizations could with advantage undertake this work, looking after the gathering, packing and shipping of the material. A large revenue could be derived from this source, and valuable service thus rendered to Canada in relieving our forest resources of a heavy strain."

Head of U. S. Forest Service Now in France

Announcement of the arrival of Henry S. Graves, chief of the United States Forest Service, in Paris has led the Department of Agriculture to explain that Mr. Graves has gone abroad to make arrangements for the forest work which the American army engineers will undertake in France in connection with the military operations of the allied forces.

Because of the opportunity for service by this country in woods work incidental to the war which the request of the British Government for the sending of a forest regiment was believed to present, Mr. Graves has been granted leave of absence from his position as head of the Forest Service, and has received a commission as major in the Reserve Engineer Corps. He has not been assigned to any command, but is acting under instructions, it is stated, to proceed to France in order to learn on the ground in advance just what conditions will need to be met, what equipment will be called for, and how extensively the services of American lumbermen can be utilized to advantage. Meanwhile the recruiting of the regiment, which has already been asked for, is being pushed by the Forest Service, and is said to be advancing rapidly.

One of the staff officers of the regiment—Capt. Barrington Moore—is with Mr. Graves for the purpose of arranging for its prompt assumption of the specific duties to which it will be assigned when it is landed in France. While organized on military lines, the work of the regiment will be industrial, not combatant. It will operate in the woods, behind the armies, getting out timbers, ties, and lumber required for military purposes.

The Northern Pacific Railway has placed an embargo against all shipments of forest products which do not show final destination. The importance of this order will be most far reaching. The order was brought about in an effort to conserve the car supply. So many transit cars of lumber have left the coast in recent weeks, or, in other words, the privilege has been so badly abused not only by wholesalers but by mills that there are at the present moment very large accumulations of unsold cars of lumber at all the diverting points, thereby tieing up cars that ought to be in use at this critical period.

Lumber Consumption for War Purposes

An Outline of Quantities Required in United States—Industrial Preparedness of Manufacturers a Great Factor in Efficient War Organization

The consumption of lumber in Canada in connection with the war has been carried on in such a varied manner that it has not been possible to present anything in the form of a useful summary of the actual quantities used. Undoubtedly the amount is very large, and the ability of the country to furnish almost unlimited quantities of lumber suitable for all kinds of work has been a great factor in promoting the preparedness of the allied powers. In the United States quite a different situation prevails. Thoroughly organized associations of lumbermen are in existence there, and their officers and members have come to the aid of the country with their vast resources in the way of information about available stocks, prices, suitable varieties, freight rates, etc. It has thus been possible to gather valuable and interesting information about the quantities, grades, and varieties to be consumed, and an excellent summary of these is contained in an address by Mr. R. S. Kellogg, secretary-manager of the National Lumber Manufacturers' Association, recently delivered before the World's Salesmanship Congress at Detroit. Mr. Kellogg's address was, in part, as follows:

Backed by two thousand, eight hundred billion feet of standing timber, and an annual cut of some forty billion feet, there can be no question about the ability of the lumber industry to meet all demands upon it for the timber needed for the national defence. The industry has the raw material, the machinery for conversion, and large supplies of the finished product ready for service. There is at least eight or ten billion feet of lumber already manufactured at the sawmills, and perhaps as much more in the many retail yards and distributing centres throughout the country.

The government is planning for mobilization camps throughout the United States, to take care of the new army of one million men. Many of the buildings will be one-storey structure, of considerable length, although some of two storeys are also planned for. They will be of plain construction, but of modern type, with the most improved sanitary arrangements. They are expected to be the cleanest, best arranged, and most up-to-date barracks the world has yet seen provided for any army.

Army Cantonment Requirements

There will be many cantonments. Arrangements are being made to secure this in all parts of the country, using the kinds of timber most available in each locality. The committee on lumber of the advisory commission to the Council of National Defence has worked out specifications for the species and grades best adapted to each region—making these specifications interchangeable so as to permit either the purchase direct from the manufacturers or the use of accumulated yard stocks in the hands of distributors, as may be determined.

The estimate, based upon War Department plans, amounts to a total of 13,519,334 feet for the construction of a standard camp to care for an infantry division of 25,000 men. There are 61 items in the specifications, some of the larger quantities of which, for example, are 1,249,848 ft. of 2 x 4-8 ft. to 16 ft. SISIE for studs and girts; 318,790 ft. 2 x 6-10 ft. (8, 12, or 16 ft. accepted) SISIE for floor joists; 213,132 feet 2 x 6-14 ft. rough for sills (double); 1,050,562 feet 6 in., 8 in., 10 in. or 12 in. siding SIS 8 ft. to 20 ft.; 3,021,092 ft., 6 in. to 12 in. SIS random lengths for roofing and sub-floors, and 1,696,764 ft. 3 in. to 6 in. random length flooring. Each standard cantonment will also require 22,000 No. 2 stock sash of 6 or 9 lights and 6,000 No. 1 and 2 stock doors.

As an example of the way in which the specifications have been made interchangeable for different regions, the dimension stuff for studs and girts may consist of merchantable spruce framing in New England, No. 2 common hemlock in New York and Pennsylvania; North Carolina pine along the Atlantic Coast to Georgia; No. 2 common Southern yellow pine or cypress in the Gulf States; No. 2 common hemlock, Norway pine, or tamarack in the Lake States; No. 2 common fir or hemlock on the North Pacific Coast; No. 1 common Douglas fir or larch in the Inland Empire; No. 2 Douglas fir, Western hemlock or merchantable redwood in California, or sound and square edge yellow poplar or chestnut in the hardwood regions. In siding, the specifications permit No. 2 merchantable spruce boards in New England; No. 1 common hemlock in New York and Pennsylvania; No. 4 North Carolina pine along the South Atlantic Coast; No. 2 common Southern yellow pine or cypress in the Gulf States; No. 1 common hemlock, Norway pine or tamarack in the Lake States; No. 1 common fir or hemlock on the North Pacific Coast; No. 2 common Western or Idaho white pine, fir, larch, or spruce in the Inland Empire; No. 2 common Western white pine, or No. 1 common Douglas and white fir or merchantable redwood in California, sound and square edge yellow poplar and chestnut in the harwood regions.

In the detailed schedule for these materials the lumber committee made the following recommendations:

"1. That all cantonments built north of the 35th degree of latitude be double-floored and sheathed, in accordance with the alternative items listed, with a cheap grade of resin-sized building paper between lining and flooring, and between sheathing and outside finish respectively. This is regarded as essential to the health of the troops in winter and as an economy in reduction of heating costs.

"2. That, in any event, 4 or 6 in. D and M siding, laid vertical, be substituted as far as obtainable for the boards and battens called for by the specifications. This is in the interests of a lighter and neater surface finish.

"3. That in the same latitudes and for the same reasons triple-ply composition roofing, or a cheap grade of shingles (viz., 4 in. sound butts in the Lake States or standard A grade in the Pacific Northwest) be used for surface roofing.

"4. That for durability and service No. 3 hardwood strips be used for surface flooring wherever obtainable; also that hardwood thresholds be used at exterior doors.

"5. That ground posts, except cedar, redwood, or cypress, be given a brush coat of creosote.

"6. That a standard specification as to size and spacing of nails be incorporated in all contracts for the building of cantonments."

Several aviation camps are being established which will also require a good deal of lumber.

Wooden Ship Construction

The second biggest item of demand for lumber in connection with the national defence is for the construction of the much-talked-about fleet of wooden ships. A great many contradictory statements on this subject have been issued, but it is reasonably certain that at least 250 vessels of standard type will be constructed of wood, using an average of one and a half million feet of lumber each, or a total of a little less than four hundred million feet. In addition to these vessels, of course, every wooden shipbuilding yard in the country is working, and will continue to work, to the limit in the construction of all sizes and types of vessels for private owners. High prices for charters make this profitable even if a boat survives only a few voyages.

The specifications for timber for the standardized wooden ships to be built by the Emergency Fleet Corporation of the United States Shipping Board run into a long list of materials—157 items for the Atlantic type and 167 items for the Pacific type.

The total quantity of lumber required for each ship to be built on the Atlantic and Gulf Coast amounts to 1,435,933 feet, of which nearly all is of the grade of dense merchantable yellow pine. A small amount of square edge yellow pine will be used, and some 10,000 feet of select white oak for stern posts, rubbed stocks and similar purposes. The various types and sizes of knees may be of either live or white oak, spruce, tamarack, cypress, or white cedar.

Some of the larger sizes of timber required for the Atlantic type are pieces 16 x 20-50 ft. for stems; 14 x 16-18 ft. for keels; 14 x 14-48 ft. for keelsons; flitch timber frames up to 12 x 20-16 ft.; upper deck beams 12 x 18-26 ft. to 44 ft.; oak stern posts 14 x 24-40 ft. The planking runs from 24 to 40 feet in length, averaging 32 to 35 feet, and of dimensions from 3 x 4 to 6 x 19; decking is principally of 4 x 4 stuff, averaging 26 feet in length.

The specifications for the ships to be built on the Pacific Coast, using chiefly Douglas fir, are similar to those for the yellow pine boats, but the total quantity of timber required is 1,692,734 feet, and some of the sizes are larger. The grade is principally selected common. Instead of oak, the Pacific Coast ships will have stern- posts, rudder-posts, rudder-stocks, and keel-shoes of selected structural gum or ironbark—species of eucalyptus. Either western red cedar or Douglas fir may be used for knees.

There are, of course, many small items of wood used in shipbuilding that in total amount to a great deal. For example, each ship will require 20,000 trenails, and it takes about one board foot of lumber to make a trenail. A trenail is simply a heavy hardwood dowel used to hold the parts together. Trenails are 1¾ in. or 1¼ in. in diameter and 26 in. to 40 in. long. Black locust has been used for this purpose, but white oak is also specified, and it is likely that other hardwoods may be used. There will also be considerable interior finish for cabins not covered by specifications so far published.

The navy may use as much as two hundred million feet of lumber for training camp purposes, in much the same fashion as the army is building cantonments. There will be many other uses of lumber by

the navy, concerning which nothing may be said at this time. We know, for instance, that one concern, whose office is in New York, assembled in Canada 550 eight-feet submarine chasers within 535 days for England. This was one of the most remarkable examples of speedy construction we have had. A "master boat" was first built, every part of which was carefully fitted and measured as permanent models or templates. From each of these templates 550 exact duplicates were made in the parts of the country best suited to the production of different materials. They were shipped to the assembling plant in Canada, and at the finish the rate of the assemblage had reached the speed of three complete boats per day. The lumber was worked up at a mill in New Jersey, and a total of over eight and a half million feet went into the operation. Should our navy undertake the construction of similar boats the facilities are available and the neiessary experience already gained.

Y.M.C.A. Buildings

The War Work Council of the Y.M.C.A. has made definite plans for the erection of some 200 buildings at the army and navy training camps throughout the country. There is expected to be a complete unit of building equipment and secretaries for every 8,000 men in camps. The buildings are of standard type, approximately 40 ft. wide and 116 ft. long, with a wing 20 ft. x 27 ft. The walls are of 2 x 4 studding, covered externally with shiplap and internally with 3 in. matched ceiling. Each building will require approximately 37,000 feet of lumber, and as in the case of the cantonments, the most available species and grades at each point will be used. The building will contain an auditorium seating between 800 and 1,000 men for moving picture entertainments and religious and educational addresses. There will be large facilities for correspondence, both in the auditorium during the day and in the special auxiliary writing-room for use when the auditorium is occupeid. Four class-rooms are being provided for the educational work which will be carried on in most of the camps, and for use of religious groups as well. For the men who wish to be alone for study or conferences with leaders, five small studies have been included in the equipment. In addition to the business office and administration centre, five bedrooms for the staff and a moving picture booth will be provided.

One of the large items of lumber consumption will be for packing boxes and crates for both the army and navy. No one can say at this time just how much lumber will be used for boxes, but it will probably amount to a total of several hundred million feet. Specifications for boxes are being worked out by the government bureaus, in co-operation with the National Association of Box Manufacturers.

Army transportation requires innumerable wagons. Recent orders are in excess of 30,000 such vehicles, all of which will be built according to specifications. The orders for these wagons have been distributed by mutual arrangement among the wagon manufacturers, and they will probably require at least twenty-five million feet of high-grade yellow pine and oak.

Soldiers must have guns to fight with and cots to sleep on.

It is said that a gunstock requires about 10 feet of lumber, so if we should make a million new rifles in this country, it will take ten million feet of lumber. If a new army of one million men is fully equipped it may require four or five million rifles. Walnut has always been the preferred material for gunstocks, but birch has also been used for contracts for the Allies, and it is possible that the birch and gum may be used in this country.

An army cot also takes about 10 feet of lumber. Recent orders by the War Department, placed in Wisconsin, are said to have exceeded 400,000 cots, which would require more than four million feet of rock elm, beech, or hard maple, chiefly 1½ in. thick.

The larger tents must have poles. A recent order for 20,000 such poles requires over 200,000 feet of lumber, which in this case is Douglas fir of 3 x 3-14 ft. stuff.

If the United States should decide to carry the war into the air it must build thousands and tens of thousands of airplanes. It is said that the Allies have 20,000 airplanes on the western front, and the wastage in very great. Light, strong material is especially necessary for airplane construction. Ash has been chiefly used in the bent portions, spruce for the wings, and for the propellers a variety of different woods, built up in laminated fashion, so as to have the necessary strength and to prevent checking and warping under the severe conditions of service. To build 10,000 airplanes may require the equivalent of twenty million feet of rough lumber.

Other war uses of lumber include the material for automobiles, artillery, cooperage, furniture, ways, docks, trench lining, saddles, mine timbers, tools, railroad construction, etc., etc. There will also be a large amount of lumber used in construction of new factories to fill war orders.

Rounding up all the different items, the best estimate that can be made is that the amount of lumber required for purposes of national defence within the next twelve months may total between one and a half and two billion feet. This sounds like a big figure, and is a big figure, yet it will not exceed 5 per cent. of one year's lumber production of this country. There is no reason, therefore, for any fear on the part of any other lumber user that the war demands will make it impossible for him to get the kinds and sizes of lumber needed for his particular purposes. We have the producing capacity and the forest resources; the only difficulty, if any there may be, is that of transportation. Car shortages are something that it seems difficult to prevent in times of emergency, but we believe that transportation conditions will finally be adjusted so as to permit the carrying on of normal industrial operations with the least possible delay.

The present crisis has demonstrated. as never before, the value to the country of business organizations. Without them it would have been wholly impossible to make the progress that has been made in the short time since war was declared in changing a totally unprepared nation into a nation that is swiftly arming itself for the greatest conflict of the ages.

The Associations of Lumber Manufacturers have had committeemen with power to act in close consultation with the government departments for the last two months. Practical specifications and reasonable prices for the materials required have been worked out and agreed upon, and arrangements made to give government orders the right of way. Competent authorities estimate that this has resulted in the saving of millions of dollars to the government and contributed greatly to the national defence. From the start there has been a prompt and hearty co-operation throughout the industry with all the government departments, bureaus, and commissions. The biggest men in the industry are giving without limit of their time and energy to the practical solution of the many problems connected with the mobilization of the national resources.

When the fight for world democracy is won no little share of the credit of the victory may be justly allotted to the lumber industry of America.

Western Canada's Wood Resources

James White, assistant chairman of the Canadian Conservation Commission, recently paid a visit to Victoria, B.C., and, after a tour of the Pacific Coast province, stated that he believed the pulp wood resources were in the neighborhood of 250,000,000 cords. He said that the situation was, however, serious throughout Canada, especially in the far east, where the extent of the pulp wood had been grossly overestimated. Cruisers in Eastern Canada and the United States had, in some cases, reported that there was enough material to last fifty years. Later investigation had proved that about thirteen or fourteen years would be nearer the limit. Mr. White said that the result was that America must now look to the west for its supply of pulp wood. With the east facing exhaustion, British Columbia's pulp making woods were destined to meet a large part of continental requirements. Soon Canada would be the world's greatest source of pulp and paper. If regulated, the forests of British Columbia could continue to give six million cords of pulpwood per annum for an almost indefinite period.

Many New Houses Required in Great Britain

The necessity for the construction of a great number of houses for the working classes in Great Britain was made the subject recently of an important interview by a deputation which called upon Lord Rhondda, President of the British Local Government Board. One of the deputation stated that approximately £30,000,000 a year was required to provide for the normal growth of the population in England and Wales alone. Mr. Russell Taylor, of Liverpool, stated that 500,000 houses would be required after the war in urban and rural districts. Lord Rhondda replied to the deputation, saying that the matter was very urgent, and it was important that the Board should be prepared so that after the war they would be able to put their schemes into operation at once. There was a widespread impression that the State would have to provide something in the way of aid for the erection of houses that would be undoubtedly necessary. His own mind, however, was not yet made up regarding the working out of the Government's part in the scheme, and he could not make any definite statement as yet.

Wants to Fine Merchants for Holding Cars

Mayor Church recently addressed a number of C.P.R. officials at a conference in Toronto in connection with the coal problem. He expressed the opinion that it was largely a matter of transportation, and "that the retail dealers and wholesalers who do not unload their cars promptly are to blame. The railways could get rid of them in a day, instead of five days, as now." Mayor Church added that he was urging Sir Henry Drayton, chairman of the Dominion Board of Railway Commissioners, to lay down rules and fines for holding cars.

Relation of the Lumber Manufacturer to the Retail Dealer

By W. D. Humiston*

It has been so frequently said that the average lumberman is the poorest merchant in the world that it is not surprising that we ourselves have begun to believe it.

As between the manufacturing lumberman and the retail lumberman the odds have generally been conceded to be against the manufacturer.

While this very uncomplimentary statement may have been true of the average lumberman a couple of years ago, there have always been some outstanding exception to such a broad generalization in the ranks of both the manufacturers and the retailers, and very recently the great majority of all lumbermen have come to see things in a new light, and have been inspired with a determination to adopt better methods, become better business men, and to co-operate more closely with each other.

The lumber business is not only one of the oldest in the world, but one of the oldest and most important in North America. It is 294 years since the first sawmill began operations on this continent.

During nearly three centuries logging and manufacturing methods, machinery, and equipment have kept pace with the development in other business. But in technical lines, up-to-date business methods, proper cost accounting and salesmanship the lumberman has fallen far behind those engaged in other fields of endeavor and has been almost blind to his opportunities. The result is that, while the country has been growing and building up rapidly, the per capita consumption of lumber has fallen off greatly during recent years, and the up-to-date manufacturer of substitutes have had an easy time in taking a large share of a business which was once all our own and which could have been largely reserved to us if we had only taken proper care of it.

During tht 277 years from the installation of the first sawmill at York, Maine, to the year 1900, stumpage was accessible and comparatively low in price; labor was reliable and cheap; most of the logs were driven down large streams at small cost; and the sawmills were located close to the territory in which the lumber was used, making the cost of transporting the finished product from the mill to the dealer low. The country was growing rapidly and the demand for lumber was large and steady. There was no substitute competition. Under such circumstances the lumbermen prospered.

It was the rule for buyers to go to the mill, and frequently they would take the entire mill-run output of a group of mills at prices which were profitable to both parties to the transaction.

While this way of marketing his product was very easy for the manufacturer, it was not particularly conducive to the development of salesmanship or good merchandising methods. The real salesmen and merchants naturally drifted into the wholesale and retail end of the business.

While the manufacturers were helplessly drifting around in a rudderless boat on the sea of modern business, without charts, compass, or a knowledge of navigation, the substitute manufacturers were launching their campaign, built on sound economic and business lines, and backed by the best advertising talent money could employ.

The result was inevitable.

With an installed sawmill capacity of three times the market requirements; with poor financing, low average efficiency in manufacturing, and without even a rudimentary knowledge of merchandising and salesmanship, the manufacturing lumberman was not able to meet substitute competition, high wages, low efficiency of labor, increasing taxes, and high costs of the supplies he used.

A few years of these conditions brought bankruptcy to some manufacturers, strained the credit of many, and reduced the bank balances of all. The climax seems to have been reached in 1914 and 1915.

Brought face to face with ruinous conditions and realizing that something must be done if the industry were to continue, the far-sighted men in the business began to investigate and gather data as a basis on which to predicate definite plans for the rehabilitation of the business on a profitable basis.

Some of the first definite conclusions reached were:

That "the manufacturer has always left the retailer to develop his own market and in late years to become the agent of the more aggressive manufacturers of substitute material."

That "definite co-operation between manufacturer and retailer is hindered by lack of knowledge of each other's needs and aims"; and

That "the manufacturers have not spent enough money on general publicity to make the consumer come to the dealer and demand wood."

While no one acquainted with the facts can dispute this analysis of the mistakes and weaknesses of the manufacturers. I want to come to their defence long enough to say that, with the almost ruinous conditions obtaining in their part of the lumber business for the past few years, very few manufacturers have been able to do their share towards financing large advertising campaigns, and those who had the ability were timid about spending money in undertaking things with which they were more or less unfamiliar by reason of lack of experience and training.

But "mistake is the discipline through which we advance," and now we must "make a virtue of necessity" and bring things about so as to do our share in helping the retailer market our product.

"Dealers handle a manufacturer's product because of inducement of price, good service, special selling plans, or similar specific advantages that the manufacturer can offer. The dealer naturally buys the lines that he can sell most readily. His quickest profits come from the goods for which there is the greatest demand. He gives preference, therefore, to merchandise for which the market has been created. The manufacturer who assists the dealer to create the market paves the way for future orders."

We, the manufacturers, must bear these business laws in mind in making our plans for the future. Co-operation between substitute manufacturers and dealers pays both parties, and I believe that co-operation between the lumber manufacturer and retailer will be found to pay even better.

Just here I want to say that, unless the retailer is alert, quick to take the initiative and willing to improve his business methods, too, the manufacturer's assistance and co-operation will be of little avail in increasing his business.

One can't sit in his office and wait for business to come to him these days, nor can he handle what business that comes to him in a careless, indifferent manner.

Selling goods is the biggest problem in the business world, and the selling of lumber will repay your best thought and unremitting effort.

Mail order competitors can only succeed in marketing their lumber in your locality by being more alert and aggressive, using more result-getting methods, and by using more printer's ink. They are wonderfully clever advertisers, and they seem to be making enough out of their business to pay for a great deal of space. They use their space well, too. Who ever saw a mail order house advertisement reading:

JOHN JONES
READY CUT HOUSES
Let me figure on your next house.
I can save you money.

There never would have been a bill of lumber sold by a mail order house if they did that kind of advertising.

It is a universally accepted business truth that the retailer in any line of business is the most important factor in the distribution of goods to the ultimate consumer.

This is peculiarly true of the retail lumber dealer, because he is selling a commodity regarding which his customer knows little or nothing, and for this reason he frequently occupies the dual role of merchant and expert advisor. Could anyone conceive of a stronger position for a salesman to be in?

The timber land owner, the logger, the manufacturer, the railroads, wholesalers, and his own community are all interested in and largely, if not wholly, dependent on the success of the retailer.

He has opportunities in successful merchandising and salesmanship that few men in other business enjoy, and he has especially attractive inducements to use originality and aggressiveness.

In many ways he has a big advantage over the manufacturer, particularly in that his own personality enters so largely into his transaction. Let me make this point clear.

Production by factory methods is merely repetition. Production methods may be completely standardized.

But no two sales are exactly alike. Selling methods must allow for the human element. Selling is individual.

Lumber may be produced at a mill at the rate of 50,000 feet an hour and the production kept up indefinitely, but each bill of lumber sold represents an individual transaction.

Now, let us see what the manufacturer should do in the interests of increasing the demand for lumber and in order to promote closer co-operation between himself and the dealer.

The manufacturer who is satisfied when he makes a sale to a dealer is not getting the most out of his field. By intensive cultivation his sales can be multiplied many times, for re-orders will not come in until the merchant disposes of his stock.

The manufacturer should establish a reputation for the quality of his product, and thus secure the good-will of both the dealer and the consumer.

When railroads first began to operate, each road had its own particular gauge of track, and could not exchange cars with other lines,

*Assistant general manager Potlach Lumber Company, in an address before the Western Retail Lumbermen's Association.

I think it is just as essential that mills standardize their grades and sizes as the railroads found it to be to standardize their tracks. The dealer should get identically the same grades and sizes from different mills any time and all the time.

I believe that trade-marking lumber will be found as advantageous to all concerned as trade-marking any other commodity.

"A trade mark establishes identity and responsibility, and partakes of the commercial signature of its exploiter."

The trade mark has become one of the elements of almost every successful business appeal to the consumer. It is going to be generally adopted by the larger mills or by the manufacturers' associations in the near future.

There are as sound business reasons why the "Potlatch Indian" should spell "Potlatch Quality Lumber" to both the retailer and the consumer as that you now have a vivid concept of both the commodity and its quality when I mention "Old Dutch Cleanser," "Rubberset" brushes, "Uneeda Biscuit," "Royal Baking Powder," "B. V. D." underwear, "Old Crow" whiskey, "Fatima" cigarettes, and "Ivory Soap."

The suggestive trade mark plus goods of permanent quality become builders of good-will, and this applies to lumber as truly as to any other article of commerce.

Trade marked lumber is surely coming.

I believe the manufacturer can and should so instruct and utilize his salesmen that they will become potent factors in trade extension work of affiliated manufacturers' associations.

Since the lumber manufacturer has awakened to his opportunities and his obligations the National Lumber Manufacturers' Association has been getting somewhat better financial and moral support than heretofore, though this support has been by no means adequate to its needs in carrying out carefully-laid plans for re-establishing lumber in its rightful field. It needs and should have a much larger fund with which to carry on its work in the interest of wood generally, and these funds should be furnished by the manufacturer of the country.

In spite of most discouraging handicaps, chief of which is the lack of sufficient funds, the National Asociation has been doing splendid work for both the manufacturers and the retailers.

Representing, as it does, all kinds of lumber, and covering the entire country, it can watch developments and plans of substitute manufacturers; it studies the viewpoint of the consumer; it is in a strong position to counteract the prejudice against wood which is so actively encouraged and fostered by substitute manufacturers; it can promote the use of wood, as such, without reference to species; and it can educate the consuming public in the proper use of lumber.

The National Association has been doing this work for some time, being only limited by its resources. It now lends dealers' assistance in furnishing newspaper advertising copy, cuts, and suggestions; it supplies trade-building literature, covering a wide range of subjects; it employs specialists, technical men, and engineers, and has facts and information not usually available for any local organization or individual. All this is gratis to the dealer who will avail himself of the facilities offered. Incidentally this association has carried on a splendid, country-wide campaign of advertising in the interest of wood generally without reference to any particular species.

Its trade extension department has been efficiently and economically managed, and has produced most astonishing results, considering its limited funds.

While these activities are excellent as far as they go, and constitute a long step in the right direction, the president and officers of the National Association do not feel that the proper work of the organization has been more than begun. If given adequate support by the manufacturer—and they will be I am sure—they want to widen their advertising compaigns; send out representatives to local meetings of all sorts to arouse interest in wood, investigating local needs and conditions at the same time. They suggest the formation of a good central service department, for the use of dealers, where correct technical information could be procured; reference books and samples of various commercial woods kept and from which moving picture films and models of buildings, etc., could be obtained.

Supplementing the work of the National Association, the various local manufacturers' associations can carry on certain work along the same lines where there will be no unnecessary duplication of effort or expense. These local associations can carry on advertising and general publicity campaigns, supporting the campaigns of the National Association, but these should be regional in scope and limited to those woods which their members produce.

These plans are not impossible or even unlikely to be carried out. As I have said, some of them have been tried, and others surely will be, for the manufacturer has at last realized his opportunity and his obligation to assist and co-operate with the dealer in the marketing of a product in which both are equally interested.

The manufacturers of the country generally are entirely convinced of the sound business sense back of the plan, and are ready and willing to pay the bills.

But these plans and expenditures of the manufacturers entail a moral and a business obligation on the part of the retailers to do their share to the common end.

You should eliminate cut-throat methods of competition, and work harmoniously together in strong local dealers' associations.

There are dozens of effective ways in which you can advertise other than in the local paper. Try the use of slides, to be flashed on the screen at the local "movie." Put up sign-boards; distribute novelties and circulars; keep a mailing list of live prospects and circularize this list at frequent intervals with good, business-pulling letters; keep a working model or two of houses and farm buildings and change them occasionally. They are cheap, and will be gladly furnished at cost by the National Lumber Manufacturers' Association.

Slick up the office and make it bright, clean, and attractive. Keep display racks on the walls well filled with literature that will be helpful and interesting to your customers. Have a rock of samples of different woods, moldings, etc., to which you ran refer Mr. Buyer. These are inexpensive and attractively gotten up by the National Association, and are sold to dealers at actual cost.

Try the elimination of all mystery and difficult figuring for your customer by naming a unit price for your lumber, etc., and by marking this price in plain figures on your bins.

Get after your representatives, village trustees, councilmen, mayor and county commissioners, and see what you can do toward repealing or heading off misguided legislation and discrimination against wood construction and shingle roofs.

See that your local architects, contractors, and builders have authoritative information about the best woods to use for all purposes, and be perfectly frank in telling them where not to use wood.

See if you can't persuade the school trustees in your neighborhood to get into line by building teacher's cottages near their schools.

Get next to the teachers and boys in the manual training departments of your schools, and see to it that they have good lumber, suited to their needs, with which to work, thereby making friends among those who will be users of it in a few years.

"Suggest that you can help the buyer and you have his attention. Tell how and you have his interest. Prove it and you are more than likely to get his order."

What we can do for the consumer is the most important question in retailing. When we have answered this question our own problems will be satisfactorily solved, and we shall have created the demand we now lack.

One of the greatest authorities on salesmanship says:

"The successful merchant of the future must approach his sales from the customer's side. It is not enough to collect to-day's profits, for your competitor is collecting to-morrow's good-will."

"Success in selling doesn't simply mean goods sold. It means customers satisfied. Tact, courtesy, open-minded fairness disarm antagonism, melt opposition, bring back business."

Be fair. Aim to sell satisfaction and your lumber will sell itself, with the aids and co-operation which from now on will be given you by the manufacturers through the national and our local associations.

We realize that the dealer does not care for lumber in his bins and piles—he wants trade. The bigger the demand for his lumber the greater are his profits—and proportionately greater are his purchases from us. Hence it is to the manufacturer's interest not only to sell his product to you, but to deliver the demand for those producers as well.

[While much of the above address refers to conditions in the United States, where the National Association operates, everything it contains has a distinct application also to conditions in Canada.]

United States Will Build Great Number of Airships

The United States Secretary of War has transmitted to Congress the drafts of two bills providing for a huge flying corps. The legislation provides for 22,625 aeroplanes and full equipment of machine guns, bombs, etc. The cost of the machines is estimated at $363,140,000. One item provides $31,000,000 for training stations. No decision has yet been reached by the Air Craft Production Board as to the purchase of lumber for the building program. The forest products laboratory at Madison, Wis., is conducting experiments with the kiln-drying of Pacific Coast spruce for aeroplane frames. The spruce lumbermen of the Pacific Coast will be thoroughly mobilized, in order that an adequate supply of lumber for the frames may be assured at all times, both to the United States and to the Allies.

Shingles sufficient to cover two small panels were recently fireproofed by the United States Forest Products Laboratory and sent to Seattle for fire tests to be conducted by the West Coast Lumbermen's Association. Shingles for one panel were painted with two coats of zinc borate paint, and the other shingles were given a zinc borate injection. Samples of these shingles tested in the inflammability apparatus at the laboratory indicate that the treatment and coating are effective.

Locating Unnecessary Expenses

By A. M. Brewer

Every dollar that a company saves on its cost of maintenance or production represents interest for one year at six per cent. on a capital of $16.66. Figured on this basis, it is obvious that any economy that eliminates a needless expenditure may have a direct and important bearing upon the value of a business. A saving of even $1 a day upon some apparently trifling detail may affect the theoretical value of the stock of a corporation over $6,000—a sum that is not to be lightly regarded by even a large concern. And the saving of $1 a day is possible in factories of very moderate proportions indeed.

The methods by which these elusive "unnecessary" expenses may be located and stopped must, as a rule, be devised by those who are intimately familiar with the detail work where the economies are to be effected, and who are in a position to suggest ways for accomplishing the necessary work by shorter or more effective routes. It is seldom possible for an executive head to point out the specific methods by which these detailed expenses may be reduced, unless he is thoroughly versed in the routine of the department, however competent he may be to analyze the work of the department as a whole and establish a standard of expense with which it must operate.

An illustration of these principles is furnished by a large manufacturing concern which suffered a period of bad business. The general manager instructed each department head, in turn, how to reduce expenses. To the sales manager, for example, he said, "Let out Brown and Smith." To the chief clerk he issued the order, "Combine this department with that, and do away with such and such a facility." All through the establishment the specific orders of the general manager were carried out.

Afterward, when things went wrong, the department heads shifted the responsibility upon their superior. "If Brown and Smith had not been fired," they said, "this would not have happened. If the 'G. M.' hadn't robbed us of this or that, the business wouldn't be crippled to-day." In other words, the responsibility was put up squarely to the general manager.

When the next period of hard times struck the company, the general manager simply told the responsible heads of departments to cut expenses 5, 10 or 20 per cent., as the case might be, without materially interfering with the facilities of the organization. Each sub-manager was thus thrown upon his own ingenuity and was held responsible. The result was a big crop of initiative in expense-saving ideas. Good men were retained who otherwise might have been sacrificed, and the efficiency of the plant was increased, leaks stopped and new methods invoked.

Responsibility is the mother of invention. If a manager is directed to attain a given result, and told that he must find the way to do it, he will accomplish more than if he merely follows instructions and moves along a prescribed course. That is, he will, provided he is the man for the job; this is one way to find out.

Almost always there is a way to cut expenses along some line that has escaped attention. For example, a furniture factory had lost $8,000 to $14,000 a year for seven years. The owners, believing the loss lay partly in power, installed new boilers, and then better machinery. Wages were cut and every outgo trimmed, still the factory ran behind.

In despair, the owners hired a successful manager at $10,000 a year, on condition that he make the plant pay. After a month spent in analyzing the situation, he concluded that the big expense lay in labor, much of which went to waste. Many piece-workers had been earning only $1.25 a day, or less. The new manager fixed the reasonable minimum at $2.50. He did this to increase the efficiency of labor at least 100 per cent., in order to establish an equilibrium between machine capacity and overhead expense on one side, and labor on the other. To accomplish this he established a bonus system, and discharged all workmen who did not prove capable of responding to the increased demands. More than half of the workers were too old or too antagonistic, and new blood had to be instilled. For a time there was bitterness in the town toward the new manager, but there was no alternative except to close down the plant and throw all of the employees out of work, and the men held their peace.

Another waste that he corrected was traced to incompetent cutting, which caused a heavy loss in raw material. Added to this, and closely allied to the labor waste, was a big loss of goods that were spoiled in machining. A whole building was found to be filled with this accumulated stock; most of it was charged off and used for fuel.

In the paint shop the manager discovered by tests that some of the men dripped a quart of varnish a day apiece. No comparative records had been kept to reveal this loss.

Failure to utilize waste material by turning it into by-products also made a considerable item. The second year after the change in managers the plant earned $14,000 net; the fifth year showed a profit of $75,000.

A big lumber concern found that it had been losing thousands of dollars a year through a waste of odds and ends. When an order for special sizes of lumber was filled, the sawed-off ends were discarded and either burned or carted away by the employees. The superintendent discovered this waste and directed that all the odds and ends were to be stored away in special compartments, with the sizes marked on them. Within a few months a big assortment of short sizes, some running as low as 2 feet in length, were held in stock. It was a surprise to the superintendent himself to find how many small orders could be filled from these short pieces. Within a year he made an inventory list of short pieces and offered them for sale at a discount. Carpenters and small dealers snapped these up quickly, for in a shop short pieces for odd jobs are always in demand. The stopping of that little leak saved over $3,000 for the company in one year.—The Woodworker, Indianapolis.

Reducing the High Cost of Sawmill Repairs

One of the unavoidable expenses of sawmilling is found in the replenishment of broken machinery parts, and at a time like the present, when everything except unsolicited advice is soaring in value, it behooves every mill man to assure himself that supplies are being handled and used with the minimum of wastage. The dark corners, closets, and basement cubby-holes in and about a sawmill plant are money-wasters, for the reason that they are the natural hiding-places of slightly-used parts, which may be needed badly at some urgent moment, but cannot be found until they turn up during some sporadic house-cleaning effort. Anyone who has inspected even the most efficiently-conducted sawmill can recall accumulations of cast-off metal parts filling odd corners and bulking large under-buildings of one kind and another.

As a matter of strict fact, much of this material is useless except to the junk man, but part of it can be used in emergencies to patch broken machines or by attention in the machine shop can be worked into smaller parts. But when everything is scattered about the plant and hidden by scraps the chances of redemption for the usable part are negligible. Railroads have realized the need of methods by which such cast-off material may be kept in view, and certain sawmill men have come to the adoption of such a system, which is the reason for this sketch. Perhaps the idea will appeal to others.

At the mill in question there is a clearing house for used parts. It stands in close proximity to the supply house, the machine shops, car shops and foundry, and is under the eye of the sawmill foreman as well as under lock and key. Under the arrangement of this mill all new material is put into stock by the supply man and charged to him by the general office. Then as the various foremen or millwrights present requisitions for repair parts he charges whatever they receive to the departments affected and closes his records so far as those items are concerned. But the used parts which have been removed in favor of the new are not returned to the supply house, nor thrown indiscriminately into a corner. They are placed in the "reclaiming house," which is the dignified title of this new institution. If they are unfit for further use they go to the junk bins, of which there are four, and are stored according to their value.

In the reclaiming house there are various divisions devoted to the numerous departments. For example, there is the sawmill side, where all sawmill cast-offs are placed, such as flanges, couplings, pulleys, pieces of shafting, and the innumerable other items that go into the mill proper. Then there is the proper allotment of space to each of the other operting departments, even to the railroad bins, where driving-boxes, brake shoes, rods, engine line shafts, pipe fittings, and whatnot may be found by the repair men when needed. In the centre of the room is a large cabinet, where bolts, nuts, and screws of all sizes are stored as fast as they are reclaimed from disintegrating and discarded parts. In short, this is a second-hand shop for everything that can be used at some future time.

The Saving System in Use

Just how important this matter of finding the desired piece of used material in an emergency may be is shown by an experience at this mill before the system was installed. One night the log-loader was brought in for quick repairs, needing a strong reinforcement over a broken casting. The master mechanic saw at a glance that he needed a piece of angle iron and remembered having noticed just such a piece somewhere about the plant. For two hours he and his helpers hunted through the junk piles, but finally gave up the search, and worked half the night fashioning the required bar of angle iron. Then two or three days later the bar was found beneath a pile of timbers in the car shop. The loading department was charged with the labor of these high-priced mechanics, when that bit of iron would have cut out two-thirds of the expense—if it could have been found. In the same way each department head is mighty glad to search through the well-arranged stocks in the reclaiming house if he can save for his department the cost of a new part by using an old one. Then, too, mechanics can devote their spare hours to reworking and assembling used parts into more elaborate and costly pieces of equipment. For example, the men

at this plant have salvaged two or three of the castings which form the journals on locomotives, and by skillful patching and welding have saved for their employers $30 or more on every item.

An oxy-acetylene welding outfit is a valuable accessory to such a reclaiming system, as it can be used to salvage material that appears to be beyond help. Locomotive frames and badly broken castings of many kinds have been made whole again with it. They have a vice in the engine room which was broken into three pieces and then welded together with this remarkable contrivance.

Brass is an item which is highly prized in sawmill repairing, and the custom in the lumber regions is for each master mechanic to save such scraps of brass as he finds until a moulder happens along to work it into slugs for future reference. Theoretically this is a fine way of handling the matter, but actually a good deal of the brass is misplaced between visits, so that there must be a general search made whenever the moulder appears. In the reclaiming house this company has a brass bin with two compartments, one for scraps picked up here and yonder and the other for filings which are saved by placing a cloth under the lathe whenever brass is being worked. These borings and filings now are worth about 15 cents a pound.

Scrap iron is divided roughly into four classes—first-class castings, seconds, railroad iron, and wrought iron. The junk values differ widely at present, as the above classification suggests. Railroad iron now is at a premium, while certain grade castings bring much more than inferior material. A junk buyer inspects a pile and bases his offer on the poorest stuff he finds therein, which is only natural, as he has to asume the burden of grading the lot. Therefore, whenever a company can sort its junk so that the buyer knows just what he is to find the chances are good for considerable gains in prices received. This idea of doing away with the old-time junk pile and storing such stuff in bins by grades is but another phase of the reclamation service.

All material affected by this system has been charged to one department of the plant or another, so that the salvage is "velvet," while the only charges against it are the entries for labor in storing and readapting the stock. And as each foreman can reduce his own costs by keeping a watchful eye upon the usable parts, he is glad to boost the system, while every reduction in a department means money in the owners' pockets, which is what the responsible executives always are striving for.—J. B. Woods, in the American Lumberman.

Export of Spruce to River Plate at a Standstill

A prominent Nova Scotia lumber exporter, in a recent letter to the Canada Lumberman, says: "Owing to the excessive freight rate asked and also to the scarcity of tonnage the former export trade in spruce boards and scantling from Western Nova Scotia ports to the River Plate has stopped. No stock of any consequence is on hand, and no attempts at production are being made. The export business in spruce and pine boards to Cuba and the West Indies has also been very much reduced. Pine and spruce are very short. It is difficult to make up an export cargo of 300,000 to 400,000 feet of spruce boards at any one port. It is also difficult to obtain a charter for Cuba. Shipbuilding is active, and material is being turned into stock for the shipyards rather than into lumber."

Enquiring Into Lumber Production Cost

The United States Federal Trade Commission has been directed to make an enquiry into the actual present cost of producing ship lumber required for the emergency fleet. This is a part of a comprehensive plan to facilitate the purchase of war materials and supplies. It is expected that a uniform plan of procedure will be arranged for the investigation of many materials, including steel, lumber, fuel oil, gasoline, coal, cement, etc. A large number of well-trained accountants and investigators have been secured for this work, and it will be carried out as quickly as possible. The investigation is an emergency enquiry, and comprehends cost of production only.

Employees Set Example in Patriotism

A practical illustration of patriotism was given recently by the employees of the Freeman-Smith Lumber Company, Millville, Ark., when they enthusiastically and unanimously voted to substitute for the usual holiday on the 4th of July a full day's work, the entire proceeds to be given to the Red Cross. Nor is this all that the employees are doing. For the next four months they will each give one day's wages a month to the Red Cross. Much the same spirit of sacrifice is being exhibited at a number of other large lumber manufacturing plants in the United tSates.

The longest wagon bridge in the world—10,392 feet in length, nearly two miles—crosses an arm of Lake Pend d'Oreille, at Standpoint, Idaho. It required 1,864,109 feet of lumber to construct this bridge, which included 2,748 cedar, fir, and tamarac piling, the combined weight of which was approximately 7,478,000 pounds.

Disston Issues Internal House Organ

Henry Disston & Sons, Inc., of Philadelphia, have inaugurated a monthly house organ for employes of the company, the first issue of which appeared July 2. The title of the publication is "Disston Bits," which has a double significance, "bits" being another name for the teeth of inserted tooth saws, one of the company's products. As the announced purpose of the publication is the stimulation and crystallization of good-will and fellowship among the employes, it has been considered desirable that all illustrations, cartoons, and editorial matter be the work of the employes themselves, and the paper is being published along these lines. From the appearance of the first issue there is every indication that ample talent is available among the 3,600 employes of the company to produce a very cerditable publication. "Disston Bits" has eight pages, 9 x 12, and comprises several departments, including editorial, sports, safety first, etc. "Disston Bits" will not in any way conflict with the "Disston Crucible," the trade organ of the company, which has been isued for several years, as the objects and purposes of the two publications are entirely dissimilar.

A Compressor Bulletin

Bulletin K-300-A, illustrating a line of power-driven, single-stage, straight-line air compressors manufactured by the Canadian Ingersoll-Rand Company, Ltd., of Montreal, has just been issued. These machines are designed for motor or belt drive, and are furnished with a special short belt drive where floor space is a consideration. They are intended for use in industrial or mining plants where units of 950 cubic feet displacement and under per minute are required. Eighteen sizes are built, giving a wide range of choice. "Circo" leaf inlet and outlet valves and the dust-proof, self-oiling, and self-contained construction of this type of compressor are fully described.

Severe Test of Atkins Saws

The accompanying illustration represents a Knight Dog used in the band mill of the Wilderness Lumber Company, at Nallen, West Va., U.S.A. Its lacerated condition is plainly shown, together with "splinters" of steel which were found after this Dog had come in

contact with an Atkins band saw. The splendid quality of Atkins silver steel saws was clearly demonstrated, as the saw was not damaged to any appreciable extent; in fact it was not removed from the wheels, but merely pointed up and used until the run was finished, as can be vouched for by two employees of the company, W. T. Hensley, filer, and John Eldridge, sawyer.

The Cuban Lumber Trade

Mr. J. C. Manzer, representing the Department of Trade and Commerce in Havana, Cuba, under date of May 31, writes as follows regarding the trade of Cuba in lumber: "The increasing lumber trade of Cuba should be of especial interest to Canadian lumber exporters. During the year of 1916 the imports of lumber by Cuba reached a total of 189,598,629 feet, valued at $7,000,000 c.i.f. Cuba. Fully one-half of this amount arrived by schooner."

Lumber Arrivals During the Year 1916

	Feet.
By schooner	95,395,246
Steamer	58,346,030
Barge from Key West	19,994,504
Ferry from Key West	15,862,849

A prominent pulpwood buyer interviewed recently at Cobalt, Ont., said that owing to scarcity of labor and the unusual trouble with flies owing to the continued wet weather, the supply of hand-peeled pulp that would be available for shipment from Northern Ontario during the present summer would not be more than 40 per cent. of normal.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Maple and Birch

Wanted several cars 4/4 No. 1 Common Maple and Birch; also few cars of thick stock, either dry or this year's cut. Box 583, Canada Lumberman, Toronto, Ont. 11-14

Wanted

Wanted second-hand timber, Fir, Spruce or Pine. State condition and price. Box 593, Canada Lumberman, Toronto, Ont. 12-15

Pulp Wood Wanted

We are prepared to buy large quantities of pulp wood for export to United States. If you are cutting and want best prices, write to Box 602, Canada Lumberman, Toronto, Ont.

14-15

For Sale–Lumber

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.

400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce. Piled widths and lengths separate.

GEO. C. GOODFELLOW,
c Montreal, Que.

Spruce For Sale

Standard Spruce Lumber, Mill Cut, for sale. Quantity, two million feet. Quality fourth and better. Piled width, thickness and length separate. Apply,

The St. Lawrence Lumber Company,
81 St. Peter Street,
14-14 Quebec, Que.

For Sale

100,000 ft. 1 in. dry Cull Birch.
150,000 ft. 3 x 6, 6/16 ft. dry Sixth Quality Spruce.
200,000 ft. 1, 2 and 3 in. C. Cull White Pine.

FRED T. SMITH,
310 Board of Trade Bldg.,
14-17 Montreal, Que.

For Sale—Dry Hemlock

50,000 feet 1 in. x 9 in.
75,000 feet 1 in. x 10 in.
75,000 feet 2 in. x 10 in.
25,000 feet 2 in x 12 in
Immediate shipment.

F. McGIBBON & SONS,
14-14 Sarnia, Ont.

Dry 1916 Stock For Sale

1 x 12 in., 12/16 ft. Com. and Dressing, White Pine, 125,000 ft.
1 x 4 in. and up, White Pine No. 2 Mill Cull, 200,000 ft.
2 x 6 and up, White Pine No. 2 Mill Cull, 100,000 ft.
1 x 4 and up, mill Run Spruce, 300,000 ft.
1 x 3 Mill Run Spruce, 35,000 ft.
1½ x 4 ft., No. 1 White Pine Lath, Two Cars.
1½ x 4 ft. Mill Run White Pine Lath, Two Cars.

The Elgie & Jarvis Lumber Co., Ltd.,
18 Toronto Street,
14-14 Toronto, Ont.

For Sale–Machinery

For Sale

One latest improved Wickes No. 10 52-in. Gang complete with saws and filing equipment, 1 Kilgore Cant Crane, Steam Board Flippers.

GOODMAN LUMBER COMPANY,
14-t.f. Goodman, Wisconsin.

Machinery For Sale

16 in. x 38 in. Wheelock Engine.
Leather Driving Belt, 62 ft. 3 in. x 22 in., double.
No. 3 Jewel Dynamo Engine.

R. LAIDLAW LUMBER CO.,
11-14 Toronto, Ont.

For Sale

One No. 5 C. B. Rogers 15 x 6 S. H. Planer and Matcher, with countershaft and:
1 pair 1 in. Shimer Flooring Heads.
1 pair 1 in. Shimer Shiplap Heads.
1 pair 3 in. Shimer Flooring Heads.
1 pair 4 in. Shimer Jointer Heads.

The Bertrand, Lockhart Lumber Co., Ltd.,
13-14 Port Arthur, Ont.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

BUILDING SUPERINTENDENT open for position, any kind of construction. Box 603, Canada Lumberman, Toronto, Ont. 14-15

A PRACTICAL LUMBERMAN, forty years old, with twenty years' experience, is open for engagement June 1, 1917. Last ten years with very large Canadian firm as superintendent and sales manager. Best of references. Box 496, Canada Lumberman, Toronto, Ont. 2-18

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED a first class right hand double cut band mill sawyer. Box 600, Canada Lumberman, Toronto, Ont. 14-14

WANTED MAN to take charge of Planing Mill. One who is capable of setting up machines, filing and grinding pattern knives. Address Drawer F., Sarnia, Ont. 13-t.f.

Business Chances

For Sale

Timber Limits and Sawmill, estimated fifteen million feet of hardwood and ten million feet soft woods. Sawmill capacity 25 M. feet, shingle mill 125 M. Docks, tug, booms, logging outfit, houses, etc. Price $35,000.

The Manitoulin Lumber Co., Ltd.,
11-22 Walkerville, Ont

Sawmill For Sale

Complete Sawmill for sale, cheap and easy terms. Capacity 20,000 feet per day. Field Lumber Company, Limited, Field, Ont. 11-t.f.

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

A. W. STEVENSON,
P. O. Box 2624,
8-t.f. Montreal, Que.

UNDER THE WINDING UP ACT

In Re: Damien Lalonde, Ltd.

1000 Christophe Colomb St.,

MONTREAL

Tenders will be received by the undersigned till Monday, July 30th, 1917, at noon, for the purchase en bloc or in part of the undermentioned immovable properties.

10. 26 lots of land in St. Denis Ward, City of Montreal, on Christophe-Colomb St., forming 114,272 feet of land, with buildings thereon erected, comprising 2 storeys solid brick Building 150 x 90 ft., iron framed, concrete foundations and ground flooring, gravel roofed, upper floor mill construction with sawmill and joiner shop, kiln and machine shop, heating and lighting systems, waterworks and one 8-car siding to C. P. Ry., and all the machinery therein contained.

Three lumber sheds, 2 shell and box factories, stables and keepers' dwelling, etc.

No tenders necessarily accepted.

For information apply to the Liquidators,

F. R. Vinet,

P. H. Dufresne, Liquidators,
99 St. James Street,
14-14 Montreal, Que.

Miscellaneous

PROVINCE OF QUEBEC

Department of Lands and Forests

Quebec, 2nd June, 1917

Public notice is hereby given that, in conformity with the law, on the 21st of August next, at 11 o'clock a.m., at the office of the Minister of Lands & Forests Dept., Quebec, there will be offered permits to cut timber on lands belonging to the Crown in the Upper-Ottawa, Lower-Ottawa, St. Maurice, Lake St. John, East and West, Saguenay, Rimouski West and Bonaventure West agencies, comprising several large blocks in the Abitibi, Upper-Ottawa and head waters of the St. Maurice and Gatineau and on River Chamouchouan.

Permits will be adjudged to the highest bidder.

The price of adjudication is payable in 3 equal instalments.

The permit to cut will be subject to the ordinary conditions of the Law and Regulation and the grantees of any of the aforesaid territory must, within a delay of three years, manufacture, in the province of Quebec, with the timber cut in said territory, either pulp or paper in the proportion of ten tons per day, or sawn lumber in the proportion of ten thousand feet board measure per day, per hundred square miles.

Further information may be had by applying to the Department of Lands & Forests.

Elzear-Miville Dechene,
Deputy-Minister,
13-16 Dept. of Lands & Forests.

Canadian Foresters in France

One of the mills of the Canadians behind the trenches in France runs day and night, and is rapidly eating up the neighboring wood. The noise of the circular saw mixes peculiarly with the constant throbbing in the air caused by the discharge of the heavy guns. A short distance from the sawmill are the remains of buildings wrecked by enemy shell fire. A thousand feet an hour is the average output of the mill, and it will be doing better than

this very shortly, as soon as the new machinery arrives.

Timber operations within range of German guns very naturally have their own peculiar inconveniences. Of course there is always the risk of the mill and its workers being blown to atoms by shell or by bombs from aircraft. Such dangers are part of the ordinary business of the day in these parts. The trees with which this particular mill is dealing have been "strafed" by the Boche intermittently for months past, which brings another problem to the workers in the mill. Chunks of shell are embeded in many of the trunks, and in the course of months these chunks have in many cases become overgrown and difficult of detection through superficial inspection, consequently there is trouble when such a trunk comes under the saw. But in spite of this and other difficulties the mill constantly turns out its thousand feet an hour, producing big balks for road mending and for the building of dugouts, lighter stuff for pit props and trench revetments, and timber of every kind which can be put to any use in the business of the war.

A journey of many miles from here into one of the fairest parts of France, into a part where the peasant even yet runs into the road to stare at the spectacle of soldiers in khaki, reveals still more of the Canadian foresters at work. They have a most interesting body of assistants—Boche prisoners. The German in the French woods seems happy in his lot. There may be seen a couple of score of them engaged in "stumping." From the manner in which they hauled at the tackle there was no reason for apprehension that any of them would drop from sheer exhaustion. They seemed tractable enough, though, and went about the work with at least a show of interest. All were sturdy fellows; some elderly, but the majority in the prime of life. One wore the ribbon of the Iron Cross.

They were all in German uniforms of field-grey, but the headcovering was most varied. A good many had the round cap of the German infantry, others wore trench helmets, one or two had the woolen "comforter" cap such as was sent out to our own men in the winter, a few wore ordinary civilian cloth caps. Here and there at a short distance were the soldiers of the guard, from English infantry battalions. The guard was not numerous. One man with a rifle is capable of looking after a power of his fellows who cannot summon such a weapon among them.

Work was suspended punctually at midday, and the company trooped off to dinner. It was served out hot under the trees by the prisoner-cook. An imperial officer accompanying us spoke a sentence to the man in his own tongue and learned that the prisoner was a cook by profession. "I speak half a dozen Indian tongues, but I believe it is the first time I have tried to speak German for seventeen years," remarked the officer. Having duly received their portions in their tins, the prisoners squatted in groups under the trees and jabbered away to one another volubly. More potatoes were put away in that picnic of Germans in a French wood than many people had consumed in London during the previous couple of months.

Another long journey through most beautiful country and they reached a third Canadian mill. Save for the villagers the Canadians have the district pretty well to themselves, and here, again, they are rapidly letting daylight into the woods.

In these French forests the lumbermen of Canada are working among their own peculiar element in the same manner to which they are accustomed at home, save that they are under military rule. Before the war is over the forestry battalions will have left their mark on France in a double sense.

Wood and Coal as Fuel

The difference in fuel value between wood and coal is considerable. Beech wood gives 8,591 B. th.u., a little more than half of the best coal. Here is a point on which the popular opinion is generally wrong. Fir yields 9,063 units. Most people have an idea that the hard woods, such as beech, oak, and birch are better than the soft wood, and they will give a better fire than the fir and the pine—pine gives 9,153 units.

The reason why people think so probably is because the hard woods do not give off quite as much gas as the soft woods, and so burn in the grate in the same way as anthracite coal. Oak only gives 8,316 units; straw gives 11,322. Straw is an exceeingly good fuel if it is compressed into blocks and burnt on the grate like other fuel. American coke gives 14,400; Durham coke gives 14,582. Pure carbon-like really first-class wood charcoal gives 14,647, so that some of these cokes, which are almost pure carbon, give nearly as much as pure carbon. This shows that carbon is the founation on which all the fuels are based. Some are a little higher in heat value than carbon, because they contain hydrogen; some a little lower because of the ash. A good coal may be taken at 14,000 heat units, and some cheaper coals are not worth more than 12,000 heat units.

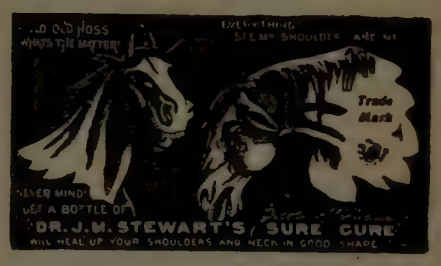
Insure your horses against sickness



Why not? You protect your mills against fire by installing fire-fighting apparatus; you protect your employees against accident by the use of machinery guards—then why not protect the health and efficiency of your horses? And how? By keeping in your stables a good supply of Dr. Stewart's Veterinary Remedies.

It may be the means of saving the life of many good horses, and will keep them sound and vigorous at all times.

A LIST OF DR. STEWART'S VETERINARY REMEDIES

Stewart's Sure Cure (antiseptic gall cure) the original, in liquid form, 16 oz. bottles	$9.00	doz.
Stewart's Excelsior Liniment, 32 oz. bottles	9.00	"
Stewart's Lightning Colic Cure, the only colic cure that removes the cause, 16 oz. bottles	8.00	"
Stewart's Pure Condition Powders, 2 lb. air tight tin can	5.00	"
Stewart's Hoof Ointment, 1 lb. can	5.00	"
Stewart's Heave Relief, large can	5.00	"
Stewart's Cough and Distemper Cure, 50 doses to bottle	7.00	"
Stewarts Proud Flesh Powders	2.50	"

Review of Current Trade Conditions

Ontario

The most important feature in the lumber trade in Ontario at present, is the fact that shipments from mill points are now being made much more extensively than earlier in the year. Some retailers in the larger cities are even complaining of receiving too much, and state that their sidings are being choked up with cars. Under such conditions it seems to be good sound advice to suggest that retailers should lay in stocks now instead of waiting until the fall, when the movement of crops will undoubtedly cause the annual car shortage to develop. All the signs this year indicate that the shortage will be much more acute than in former years. The general trade situation continues unchanged. Munitions plants are actively engaged and are consuming large quantities of lumber. Furniture factories, agricultural implement factories, etc., are also very busy. The building situation shows very little improvement throughout the province, though in some of the larger cities the moderate improvement noted earlier in the year is continuing. At Toronto, for instance, building permits for the year to date are greater than those of 1916 during the corresponding period. There is quite an improvement in the building situation at Toronto in connection with factory and warehouse buildings, but unfortunately for the lumber business, most of this is being designed in reinforced concrete.

Prices of practically all lines of lumber are firm. The trade in white pine with the United States is very active and quite a large quantity of 3-in. deals which were manufactured for the English market are being sold in the United States, in many cases to be used for various purposes arising out of the war. Hemlock is still very strong and scarce. The outlook is for continued scarcity and firmer prices, on account of the labor situation at the mills and the probability that the demand will exceed the output considerably, at least well into next year. Lath are quite high in price at the present time, but there is a feeling among the trade that on account of the lack of house building they may be expected to drop in price to some extent. No heavy decrease is expected, but logically the situation looks like an easing off. The bulk of the manufacturers in Quebec and the eastern provinces, however, are not making any spruce lath this year, devoting their attention largely to the production of pulpwood.

B. C. fir in short lengths is moving well, the demand is fairly active and shipments are coming in satisfactorily. The Dominion Government have notified B. C. mills that long lengths in B. C. fir must be held for government account in connection with shipbuilding.

Shell box manufacturers at Ottawa have recently completed most of their contracts on hand, and the result is a falling off in enquiries for stock from this quarter. Stocks of dry lumber are decreasing steadily, but the new cut is coming on the market more extensively. Prices continue firm, with an upward tendency. A good demand is reported for white pine lath, and some price advances are reported. The Ottawa Valley output this year is expected to show a decrease.

The export trade continues to suffer on account of the scarcity of vessels. The entry of the United States into the war is expected to bring relief in this connection, as they will probably consume great quantities of lumber in munitions work.

Eastern Canada

Montreal wholesalers report a greatly increased demand from the United States. This is the result of the great requirements of the United States Government for shipbuilding and camp use and for other purposes connected with the war. Prices all continue strong, and the tendency is still upward. Local trade in Montreal is slow; the yards buy only from hand to mouth. Building operations are very light, and permits show a slight falling off for the first six months of 1917. In other parts of the Province of Quebec building operations are a little more active. Exports to the United Kingdom are still very small, consisting entirely of spruce for the government and a slight quantity going forward on South African account.

The market for spruce frames at Boston has been strengthened by the placing of large government orders for spruce to be used in the construction of army cantonments. Practically all important eastern spruce mills are now turning out government schedules on urgent orders which are obliging them to refuse private business. The tendency of price is upwards. Canadian mills are shipping their surplus random to New England and New York markets, and so the price is not advancing. Spruce boards are very firm and the demand is brisk. Matched spruce boards are selling well, large quantities having been taken for army buildings. Further advances are expected generally. More strength is reported in the Boston market for hemlock, and record prices are being obtained for quick shipments of boards and planks. The Boston hardwood market is very firm with prices moving upward and a large volume of business in progress. Ability to make shipments seems to be the chief question considered, rather than price. Birch and maple are in strong demand, and ash, basswood and oak are active. Shingles are quiet at Boston, but prices are steady. It is expected that army engineers will decide to use wood shingles on the 700-odd buildings at the Ayer cantonment. Lath are quiet and prices are about steady, though in a few instances manufacturers are not quite so stiff in their quotations.

A Boston firm of wholesalers report that prices are firm and stocks are low in retail yards, but building operations are quiet. General manufacturing throughout New England is good, and pine is in fair demand.

United States

The chief subject of interest to United States lumbermen during the past fortnight has been the extensive purchasing of lumber by the government, and the filling of these orders. In the southern pine market this business has overshadowed ordinary business almost entirely. Nevertheless, it appears quite evident that some buyers are anticipating future requirements so as not to be short of stock in the fall. The arrival of the government upon the market at a time when ordinary business is quiet makes it certain that there will be no unsold stock accumulating at the mills this year. An immediate result of this development is the decrease in the number of transit cars that are being offered. A number of price changes are reported, but they seem to be of a varied nature, increases and decreases balancing one another, and making the fluctuations appear to be in the nature of establishing a proper relation of values between different grades. One hundred and forty-six southern pine mills, during the week ended June 29th, shipped 111,422,208 feet. Their production was 84,740,055 feet, and orders booked amounted to 95,381,760 feet. The shipments were the heaviest for any week during the present year and the production was about 15,000,000 feet below normal.

The government requirements of spruce for cantonment construction and for aeroplanes continues on an increasing scale. It is rumored that the government is considering the prohibition of the export of spruce that can be used for aeroplane manufacturing and that control of prices of aeroplane grades may be taken over by the government.

White pine producers are experiencing a great deal of difficulty on account of the labor shortage. The demand for their stocks is increasing and stocks on hand are being depleted. Building operations in some of the most important white pine markets are reviving. Prices are firm. The demand for hemlock continues very strong and government requirements are an important factor in this trade, as hemlock is being used for cantonments far more extensively than was at first expected. The market continues firm with a slight upward tendency.

Hardwood manufacturers report a continued increase in the demand for their products, with the exception of a few lines that are not in much demand at this time of year. The government's requirements are increasing steadily. Manufacturers are unable to obtain sufficient cars to move all the lumber they are selling or to get the logs they need to the mills. There is a great demand for ash, hickory and oak for industrial uses and prices seem to be regulated largely by the ability of the manufactures to deliver. Very little stock is being accumulated in mill yards, nearly everything being taken by the buyers right from the saw. Prices are firm and many lines show an upward tendency.

Great Britain

There is nothing to report in connection with the London timber trade that can be considered really new. The market is very quiet, importers and merchants alike report that there is very little business. Importers are not inclined to look with favor upon prices that shippers are asking. They are hesitating to purchase deals at such prices as £46 to £48 per standard, and battens at £42 to £44, or 2 x 4 to 2 x 6 at £40 to £42, in the docks or at the wharves. At such prices, even the boldest operator is inclined to hold off from the market. London importers have been purchasing sparingly of planed goods at £30 per standard c.i.f. London basis.

The numerous regulations issued by the Timber Control Department continue to restrain the operations of the timber trade at Man-

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

chester, and importers are complaining bitterly against the delays and other difficulties connected with the securing of permits, claiming that much of this is unnecessary.

Generally speaking there is a fair trade in progress on the formal certificates and guarantees as between merchants and merchants. The trouble comes in most cases later, when the consumer enters the transaction. All kinds of stocks of imported timber are low and the import is far below normal. Prices of Scandinavian stock are being held so high by shippers that very few contracts are reported. Norwegian shippers are asking £30 per standard, f.o.b. for deals, battens and scantlings, and £32 c.i.f. for floorings with the addition of war risk, insurance and difference in the rate of exchange. Swedish stocks are being held for £46 to £48 c.i.f. for deals, £44 for battens and £42 for scantlings.

The spruce situation at Liverpool shows no change. The arrivals have been light, and the outlook for future imports is poor. Stocks have been brought down to a very low point. It is considered doubtful whether the permission to import Scandinavian goods will afford any important relief. The whole trade is a unit in the belief that the removal of obstacles in the way of importing Canadian spruce would be a great benefit. This, however, does not seem to be a likely development at present and more and more reliance will have to be placed on Scandinavian goods. Imports for government requirements have been in fair volume and are being moved steadily by the railways. A good demand for birch planks and logs continues, but stocks are so low that not much actual business is put through. The demand for Quebec birch planks is particularly good, 2½ in. and 3 in. being in greatest favor.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Montreal Wholesalers Report Strong United States Demand

Montreal, July 6.—(Special to the Canada Lumberman.)—The feature of the trade during the past two weeks is the increased demand from the United States. Wholesalers doing business with firms across the border state that orders are coming forward extensively and that enquiries are also much better. This is due to the immense call for United States stock for shipbuilding and camp uses; and, while there may be a falling off in our lines for building, this will be more than counterbalanced by the orders sent to Canada for purposes arising out of the war and to supply deficiencies caused by the heavy United States Government requirements.

Prices continue to hold up, and the general opinion seems to be that there is little likelihood of any reduction. The tendency will be the other way, especially if there is a continuance of the good buying from the United States.

Local business is slow, the yards buying from hand to mouth. This is accounted for by the condition of the building trade. During the last two months the permits have shown a very decided decrease, more than nullifying the excellent figures during the first four months. For June the total was $338,870, a falling off of $409,180. The total for the year to date is $2,447,784, a loss of $7,285. While building in the city is thus falling behind, reports from other parts of the province indicate that construction is fairly good, with the same features that characterized last year—a considerable number of churches and educational buildings.

Firms dealing in British Columbia lumber are still in doubt about the course of the Imperial Munitions Board regarding the use of British Columbia timber for Eastern shipbuilding. It seems to be the regulation now that either spruce or pine must be used. This means that some cars on the way and ordered by shipbuilders must be held up, and that a very important part of the trade done by wholesalers handling British Columbia timber is cut off, at any rate for the time being. The probability is that the regulation will have to be altered, as it is stated that timber of lengths required cannot be secured except in British Columbia. The matter has been taken up with the Munitions Board.

The exports to the United Kingdom are very small, being restricted to spruce for the government and a little for South Africa. Efforts have been made to obtain permits for stock for private consumption, but the British Board of Trade declines to issue any.

New Stock More Plentiful Now at Ottawa

Ottawa, July 6.—(Special to the Canada Lumberman.)—The Ottawa lumber market has experienced a considerable change during the last two weeks, due to a decline in the number of enquiries and orders received. There has been little business going on, but there is a feeling among the trade that business will pick up within the next two or three weeks. Stocks of dry lumber are diminishing daily, and the market is by no means overstocked—in fact, in the opinion of some manufacturers, stocks of dry lumber are low, but it is generally said that they are sufficient to meet the present demand. More of the green cut is coming on the market, replacing the failing supply of dry lumber of practically all grades. Prices remain firm, with an upward tendency.

One of the most important decreases in the number of enquiries and orders to the manufacturers is due to the makers of shell boxes, who are not buying stocks, as they are near the expiration of their contracts, and are using material purchased in the spring to finish out with. No. 1, No. 2, and mill run grades of white pine lath are steadily increasing in price, though there is not a heavy demand. The lumber cut of the Ottawa Valley this season is not expected to equal that of last season, though one, or perhaps two, mills will exceed their last season's cut. The destruction of the Colonial Lumber Company's mills at Pembroke by fire will eliminate a considerable part of the season's cutting operations. John R. Booth will not cut as much this year, and at present is operating the mills with day shifts and with only a few saws going at night.

Several of the mills report a large falling off in export trade, due to the shortage of bottoms. With the United States utilizing a large amount of lumber in munitions work, manufacturers and retailers look for an increase in Canadian trade to the United States shortly. Two mills which have a fairly large American business have filled several extra orders since the United States declared war. During the last two weeks, however, the enquiries reaching Ottawa from the United States have shown a falling off in comparison with the four preceding weeks. An order totalling 60,000 9.2 shell boxes will be completed by the plant of the estate of James Davidson next week. This firm will cut 9,000,000 feet of lumber this season. Three hundred men are engaged. One hundred and fifty of them are in the woods or on their way thither, and the remainder are employed in sawing operations at Fort Coulonge, P.Q. Operations at Fort Coulonge will cease about August 1.

The proposed 15 per cent. increase in freight rates for the transportation of lumber is causing a good deal of concern locally. Mr. Frank Hawkins, secretary of the Canadian Lumbermen's Association, states that, while the association is not likely to oppose an increase, the lumbermen view the 15 per cent. advance as too heavy, and are of the opinion that the railways could transport lumber profitably at a smaller percentage of increase.

The present export situation is one of the most difficult that lumbrmen have ever had to deal with. Stocks sawed for the English market before the embargo went into effect are not of the desired sizes for use in the American market.

The demand for building materials continues small. Most of the demand for such lumber at present is for patching and repairs.

Boston Market Report—Manufacturers in Strong Position

Boston, Mass.—(Special to the Canada Lumberman.)—Conditions existing in this market at present as regards the retail trade are, so to speak, right between "hay and grass." In other words, the majority of the retailers have adopted a waiting policy in regard to placing many new orders.

In our opinion, the two principal reasons for this are: First, that the demand for house building has fallen off to its low ebb; second, the continued very high prices on all kinds of materials.

One reason for the falling off in the demand for house building is the lack of incentive to speculative building because of the returns which people receive from this class of investment, and also because it has been more difficult to raise sufficient funds for this speculative building at the increased cost of materials and labor.

The curtailment of buying by the retailers for the ordinary purposes has been more than offset by an increased outside demand. One single instance is the present demand of the government, which is very large. Augmenting these conditions with the moderate production this year, we feel that the price of lumber will remain at its present level and that, when the retailers, after the midsummer lull, come into the market again for their fall requirements, there will be a further advance.

In addition to the above, we have not taken into consideration the

PURER MILK

for Your Men at Less Cost to You

Liquid milk has been replaced in cooking by the modern milk powder, KLIM.

KLIM is made from the purest and freshest milk received daily from Ontario farms at our plants in Burford, Hickson, Brownsville and Belmont. The milk is separated, pasteurized and reduced to powder form by the most sanitary mechanical process obtainable. KLIM is used in all cooking, and is more

CONVENIENT,
TIME-SAVING,
ECONOMICAL

than liquid milk.

KLIM costs less than any other form of milk because it will remain sweet and pure until the last grain is used. It does not require ice in Summer nor will it freeze in Winter.

You save 75 per cent. in freight charges, as you pay freight on nothing but milk solids which contain all the food value in the milk.

If you have not tried KLIM, order a sample 10 lb. tin from your supply house to-day.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

proposed advance in freight rates and the probable duties which will be assessed on lumber coming from Canada.

These increases will have to be paid by the consumer, as the mills are in a position, under the present conditions, to be a little more dictatorial in acceptance of business, so that they are accepting orders with the provisions that any increase in freight or any duties which may be assessed are to be added to the price at which the order is taken.—Boston Wholesaler.

Quebec Cullers' Report

The following comparative statement of timber, measured and culled to date, is furnished by the Quebec Supervisor of Cullers:

	1915, cu. ft.	1916, cu. ft.	1917, cu. ft.
Waney white pine	139,240	16,680	78,040
Oak	78,160	167,560	37,920
Elm	46,840	58,880	66,520
Ash	480	240	320
Birch and maple	42,240	46,880	15,800

Box Shook Openings in Argentina

Trade Commissioner Reports Opportunities for Canadians to Share in Important Market

Large numbers of boxes are used by the Argentine packing houses for the purpose of shipping the various classes of meat products, such as sweetbreads, livers, etc. The boxes are purchased knocked down and afterwards put through a nailing machine at the works. In normal times most of the shooks are imported from Sweden and the United States, but lately, owing to the larger requirements consequent upon the increased European demand and the difficulties experienced in obtaining regular supplies from abroad, orders for considerable quantities have been placed locally.

Enquiries made at two of the larger establishments regarding the style, measurements, and approximate prices of boxes in use elicited the following information, which may be of interest to Canadian box-shook manufacturers.

Meat boxes in general are required to be made of a non-odorous spruce or similar class of wood. They are shipped well tied up in bundles, containing 20 tops, sides or heads, and 25 bottom pieces each, each bundle being bound tightly with baling wire. Meat boxes are allowed into Argentina duty free.

The dimensions given for the five principal types used by one of the largest packing houses are as follows:

	Width. Inches.	Length. Inches.	Depth. Inches.	Ends. Inches.	Sides. Inches.	Tops and bottoms. Inches.
No. 1 ...	9⅜	12 15/16	11 3/16	¾	½	½
No. 2 ...	16	15 13/16	9	¾	⅝	½
No. 3 ...	12⅜	18½	12½	¾	⅝	½
No. 6 ...	17	24	8	¾	⅝	⅝
No. 7 ...	17	26	12	1	⅝	⅝

The measurements given above are interior. The prices c.i.f Buenos Ayres which are being paid to-day for meat boxes of the above dimensions are as follows:

	Each.
No. 1 Parana pine	$ .25
No. 2 spruce pine	.42
Parana pine	.34
No. 3 spruce pine	.51
Parana pine	.40
No. 6 spruce pine	.68
Parana pine	.57
No. 7 spruce pine	1.02
Parana pine	.72

Parana pine is a Brazilian wood, somewhat similar to that generally known as Brazilian pine, but is more yellow in color than the Brazilian pine, which has a streak of red. Parana pine is not, of course, so well adapted for the purpose of meat shipping as is spruce, but, as can be seen, it has a considerable advantage in point of price.

Another large English freezing establishment which specializes in corned beef is using two different sized boxes of the following dimensions:

To hold 48 one-pound cans—Inside measurements: Length, 17½ inches; width, 9¾ inches; depth, 8 inches. Wood measurements—Sides, 19 in. x 8 in. x ⅝ in.; head, 9¾ in. x 8 in. x ¾ in.; tops and bottoms, 19 in. x 11 in. x ½ in.

To hold 12 six-pound cans—Inside measurements: Length, 21½ in.; width, 13¼ in.; depth, 10¾ in. Wood measurements: Sides, 23½ x 9¼ x ⅝; heads, 12 in. x 9¼ in. x ¾ in.; top and bottoms, 23½ in. x 13¾ in. x ½ in.

Eighty per cent. of the total number of boxes used are of the first type—i.e., to hold 48 one-pound cans. Supplies of these boxes have been received from Europe, and some are occasionally purchased locally, and the printing in each case is different; those from Europe being ink-printed, whilst those purchased locally are fire-branded.

The present source of supply is Sweden, and the boxes, made of Norwegian spruce pine, well tied up in bundles containing 20 tops, sides or heads, and 25 bottom pieces each, work out at the following prices, c.i.f. Buenos Ayres:

Boxes to hold 48 one-pound cans—88c paper, at 44 and 1.0364—$0.373 United States gold.

Boxes to hold 12 six-pound cans—$1.31 paper, at 44 and 1.0364—$0.556 United States gold.

Boxes made of Brazilian pine, Brazilian spruce, and Argentine poplar have been used with good results.

In normal times the boxes were obtainable at prices 30 per cent. cheaper than those quoted above.

This freezing establishment is prepared to consider quotations c.i.f. Buneos Ayres, including the branding of its mark on the four sides, it not being of much importance the way in which they are marked, provided this work is well done and the boxes altogether good to look at.

A third company, owning two large plants, are at present using poplar shooks, made locally, for a large range of different-sized boxes. Quotations c.i.f. Buenos Ayres will be considered for shooks of the sizes given and for the quantities enumerated, which can be obtained from the Trade Enquiries Branch of the Department of Trade and Commerce, Ottawa..

How Much Money Should Be Spent in Yard Equipment?

The question of how much money should be spent in the erection of sheds and office building at a country point admits of much discussion and a wide divergence of opinion. The matter of the amount to be spent upon the office proper is largely determined by the degree of desire on the part of the owner to make a show-place of his yard. Beyond a certain amount spent to provide shelter for the working force and the records, any money spent upon an office building must be considered as spent for advertising purposes or to satisfy the personal vanity of the owner. With the latter we need not concern ourselves, as it is an undisputed fact that money spent solely for that purpose is outside the dictates of good business, and has no place in the category of the business side of a man's career.

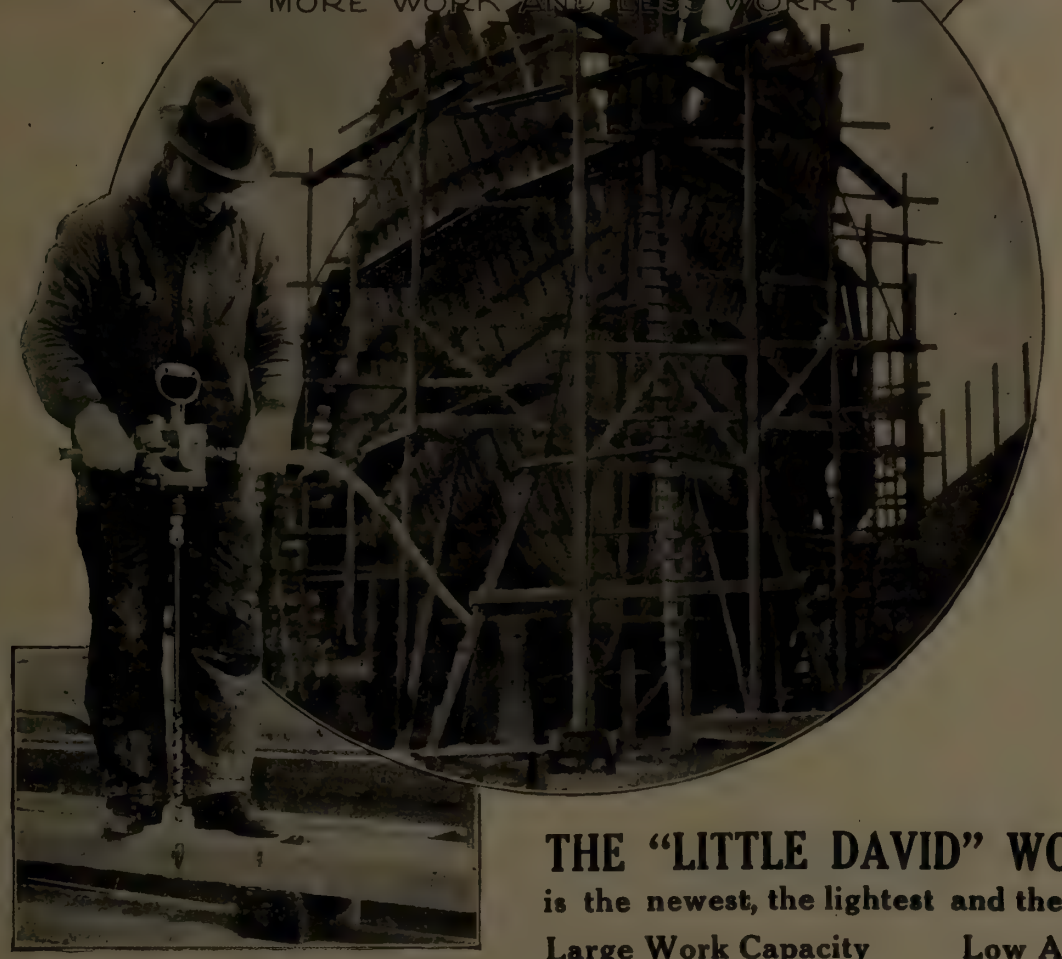
As to the matter of considering such money spent for advertising purposes, it is largely a matter of personal opinion and viewpoint. Some claim that money spent thus has practically no advertising value, while others claim that, spent with an eye to creating a demand for certain goods, it is well spent.

There is no doubt but that an attractive place of business, no matter in what line, is an aid to salesmanship. And by salesmanship I refer to that factor of the business which is directly responsible for the volume of business done. It is equally true that the tendency to make a show place of their place of business is growing rapidly with business people in all lines. This is largely the result of increased competition, which is responsible for a decrease in the volume of business done that is yearly bringing the sum total down to the dead line, below which it is impossible to make a profit. To combat this competition affords the only means to a man's survival in business. And there is a growing feeling that to make one's place of business more attractive to the buying public helps to combat it. Goods well displayed are half sold, and the possession of an attractive office of ample dimensions opens the way to the showing of certain specialties, the sale of which one is desirous of pushing, in a most advantageous manner.

What to Do With the Office

Too many lumber offices, more ornate than their neighbors, are, however, built without an idea to advertising value. The fact is lost sight of that it is possible to use in the interior finishing of the office certain items whose use is perhaps not so familiar to the general public as the materials ordinarily employed for such purposes; that it is possible to work into the interior construction certain specialties which one is featuring, in such a manner as to render them particularly appealing to the prospective purchaser of building materials. For instance, if a man is making a specialty of softwood veneer panels, it is senseless for him to put up an office and finish it throughout with lath and plaster or beaded ceiling. It is equally as senseless for him to hang an ordinary four-panel pine door in his office if he is making a specialty of a veneered five-cross panel fir door. Or to paint such a door as the last mentioned when it should have its natural beauty of grain brought out by an application of oil and varnish; or to lay an edge grain fir or yellow pine floor, if he is making an attempt to stimulate the sale of maple or oak flooring in his territory. Or if he lays the fir or yellow pine flooring, how can he hope to demonstrate the suitability of these materials for flooring, if he allows the floor to

YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING
MORE WORK AND LESS WORRY



THE "LITTLE DAVID" WOOD BORER
is the newest, the lightest and the most powerful.

Large Work Capacity
Easy to Operate
Low Air Consumption
Low Cost of Upkeep

Leading shipbuilding companies are standardizing "LITTLE DAVID" Tools because of their capacity for work, ready control and low air consumption. Other features which have turned the scale in favor of these tools are their simple construction and low upkeep costs.

Our No. 40 "LITTLE DAVID" Riveter is being widely used in wooden shipbuilding, for "horsing" in oakum, etc. This tool is a wonderful time-saver in this industry, where time now counts so much. Bulletins covering the "LITTLE DAVID" Tools, as well as prices, etc., will be gladly sent on request to your address. Write nearest branch office to-day.

"LITTLE DAVID" Tools for shipbuilding comprise Chipping and Riveting Hammers, Drills, Reamers, Grinders, Wood Borers, etc. The "LITTLE DAVID" Wood Borer shown above is made in three sizes, boring holes 1 in. to 4 in. The machine is reversible, and the largest size is about 10 lbs. lighter than other wood boring machines of the same capacity.

Another desirable tool is our CC-101 Drift Bolt Driver. With it, bolts can be driven in any position and at any angle. Two men with one of these machines, will drive a 1⅜" diameter bolt 5 ft. long, with 100 lbs. air pressure through oak with 1/16" drift at the rate of 5 ft. in 25 seconds. This is a great advance over driving these bolts with a sledge hammer. Our nearest branch will be pleased to give you full information.

202 Board of Trade Building

MONTREAL

become coated with dirt, instead of keeping it well cleaned and oiled at all times?

So much for the advertising value of a well constructed office building. It is an obvious fact that the lumbermen in a great many sections of the country are far behind the average merchants in other lines when it comes to making the most of advertising value out of that which they have at hand in their business. They are either notoriously lacking in the merchandising instinct, or, having it, have not as yet awakened to the necessity of developing that instinct if they are to hold their own.

Now, as to the advisability of a large outlay for office and shed, even though it is figured that such an expenditure can be made in the case of the office and so made as to carry with it a maximum of advertising value.

Determined by the Character of Trade

If you are operating in a new territory, one which is just being settled, it is likely that the volume of business offered you will be large. It will likely be so large that you will feel justified in picking and choosing it very carefully and passing on to your competitor a considerable portion which you do not consider gilt edge. Your sales are easily made. No salesmanship is required on your part. Your customers are not much concerned with the size of your plant or its appearance. They are too busily engaged in putting a roof over their own heads to stop to wonder at the fact that yours is not of the latest design; that it may even be leaking. They are not so much concerned with the fact that the floor in your 12 x 16 shack which you are using as an office needs oiling as they are with the fact that the cars you have on the road may not contain any of that particular kind of flooring which they wish to use for the floors of their shacks. They consider themselves fortunate in being able to purchase lumber and building material at all.

In a case of this kind, there is little or no demand for such an item as a veneered panel, and consequently no need for stocking and displaying it. Your shack-office answers all your requirements very nicely. As for the matter of your stock, it is very largely composed of rough and common lumber which suffers very little from exposure to the elements for a reasonable length of time, if it is properly piled. The large percentage of this class of material is occasioned by the newness of the territory and the fact that the dwellings being erected are of a comparatively primitive nature. Due to the heavy demand for material, your stock is turning rapidly and so it is not exposed to the elements for any considerable length of time. Thus, from the standpoint of depreciation on stock, the simplest possible arrangements in the way of shed space are sufficient.

Do Not Tie Up Too Much Capital

The fact that you are located in a new territory renders the future of your yard more or less problematical. You may decide after operating for a time that credit conditions in your particular territory are not what you thought they were and that consequently you would be better off in business at some other point. In that case, the less money you have invested the easier for you to pull up stakes and move. Or, if you are trading or selling, the less you have invested the better off you will be.

Then again, there is the matter of size of territory. The fact that your territory is new means that you are subjected to the danger of neighboring lines of railroad being built or extended into your territory. Should this happen, the establishment of towns on the new lines would mean a reduction in the size of your territory with a consequent falling off in the volume of business available. This may affect you to such an extent as to render your yard non-profit-making. In this case, to sell or trade it will prove next to impossible because of the fact that your competitors and other prospectives are, like yourself, aware of the true conditions obtaining at your point. Here again, the less you have invested, the greater the likelihood of your being able to liquidate without taking too great a loss upon your investment.

If, however, your yard weathers the storm; if you find credit conditions are all that you expected them to be, and if you have operated at your point long enough to become satisfied that there is little likelihood of a reduction in the size of your territory for some time to come, then it is time you looked about and took stock of how things are going. It is possible that your competitors have been operating along the same general lines as yourself. They may be still doing business from their shacks and making no move toward the erection of more pretentious quarters. If they continue in this way and the needs of your community have not altered to a point where the carrying of a heavy stock of uppers is necessary, then there need be no particular hurry about your tying up much of your capital in building and improvements. A little remodeling of your initial plant and a small addition to your shed perhaps may prove sufficient to your needs for some time to come.

If your competitors have been doing business from modern, up-to-date plants for some time, it will not be advisable for you to put

NOW that the price of Black Tea has soared to a very dizzy height, how would you like to try a blend that we are putting out at a very moderate price, and as a good drinker? Or, perhaps you might be inclined to go back to Japans, which were almost exclusively used in the camps of a quarter of a century ago, and which are very serviceable and at a much lower price than blacks are at present.

off for too long the erection of a similar plant. To do so will create in the minds of the public the idea that you are only in business at their point for the purpose of taking out all the money possible from the community and putting back just as little as possible. They will begin to feel that you may perhaps be figuring upon making a move when once you have taken the cream of the business. In short, you will find this idea gradually spreading throughout the community and slowly undermining your business standing. With this will come a falling off of business and a consequent lessening of profit. To delay matters too long in a case of this sort may prove short-sighted policy.

Convey the Idea of Permanence

If you are located in an old territory, one where the volume of business has touched bedrock, where the community has been built up to a point where large and commodious dwellings are the rule rather than the exception, you will find a more or less elaborate plant very much of a necessity. You will find your customers much more critical of yourself, your methods and the apparent condition of the stock you are selling them. You will find the amount of money you have tied up in your higher grades of lumber rather large. Consequently you cannot afford to overlook entirely the matter of depreciation upon the stock as its amount will perhaps exceed interest and depreciation charges against an addition to your shed.

In this case, your volume of lumber sales having reached bedrock, and there being little or no probability of their materially increasing, you have been forced to take on the handling of more and more side lines each year in order to bring your total volume of business up to a point where your venture will show an adequate profit. These side lines in many cases represent rather heavy investments, and are of such a nature as to require shedding or warehousing. This fact helps to make the erection of a more elaborate plant advisable.

At a point of this nature you have settled down to a permanent basis of doing business. You are there to stay. Your competitors and neighbors are daily adopting more advanced methods of merchandising. They are overlooking no opportunity to place themselves and their business prominently before the public eye. And it is likely that they are falling more and more into the habit of making a show place of their business stand. This makes it highly advisable for you to do likewise, and the fact that your point has a good future assured for years to come and consequently places you in a position where you reduce your annual depreciation charge against your plant account by spreading it over a longer term of years, renders it almost obligatory upon you to erect a more pretentious plant.—I. B. Hanks, in the Mississippi Valley Lumberman.

Narrow Bands Need Careful Attention

Especially at this time, when narrow band-saws will be used to an unprecedented extent in shipbuilding and allied industries, a reminder that they should receive as careful attention as any other saw is doubtless appropriate. So much more satisfactory results and such economy are effected by proper care that a consideration of some of the more common forms of abuse will be worth while.

Many a perfectly good saw has been ruined by defective or incorrectly adjusted guides or thrust bearing. Friction case hardens the back edge of the saw and results in breakage there which probably would have been avoided by a few minutes' attention to the guides and bearing.

Another fertile source of difficulty is the use of very sharp-cornered files in fitting. This, of course, makes a sharp angle in the gullet, which has a tendency to weaken the saw. Only on extremely narrow saws with fine teeth is it necessary to use a very sharp-cornered file. On saws of ¼-inch or more spacing, however, a round edge blunt band-saw file should be used. If this practice is adhered to and the saws kept well set and sharpened the greatest single cause of breakage will be eliminated.

In many instances operators do excellent work in setting and sharpening, but make the error of attempting to run too long with one fitting. The saw cannot be produced which will be proof against breakage when run with dull edges. It is just as important to keep these saws really sharp as it is any other saws in the mill. The reason some operators run dull saws is doubtless to save time and trouble in fitting, but it is so much easier to sharpen two half dull saws than one which is excessively dull that labor is actually saved by changing frequently.

Of course, these points are recognized by every seasoned mill man, but it is such an easy matter to overlook them or to slight them for seemingly more important work that printing them here may obviate a deal of trouble.—Disston Crucible.

Col. J. B. White, of the Canadian Forestry Corps, has been gazetted deputy director of forestry, and Lieut.-Col. J. B. Donnelly has been gazetted assistant director of forestry.

Will Lumber Employees be Exempt?

Western Manufacturers Believe Output Threatened If Staffs Are Depleted for Overseas Service

(From a Western Correspondent)

Lumbermen of the Mountain district are awaiting with interest some information concerning the industries which are to be exempt from the conscription of their employees. They point out that, while the public generally may not realize it, the lumber industry in the Mountain district of British Columbia is almost entirely a war industry—that is to say, it is engaged in supplying material without which other war industries, such as mining, agriculture, shipbuilding, and munitions-making, could not be carried on. Last year's figures, showing the destination of lumber shipments from the Mountain section, are quoted in this connection. Ninety per cent. of the output went to the Prairie Provinces; 7 per cent. was sold locally; 1 per cent. went to Eastern Canada; 2 per cent. was exported to the United States. Lumbermen say that the export business to the United States might possibly be excluded from the list of war business shipments, but that practically the whole of the balance of 98 per cent. of the shipments were used in industries absolutely essential to the successful conduct of the war.

Take the shipments to the Prairie Provinces. For several years there has been virtually no building of residences in the cities. The lumber sent to the Northwest has been utilized almost wholly in the rural districts, where it has been consumed by the farmer in the pursuit of his business of producing foodstuffs for Canada and the entente nations. The destinations of shipments prove this. Practically every shipment that is being sent out is for rural consumption. The exceptions are in cases such as shipments to Medicine Hat and other points where shell boxes are being manufactured. Farmers have never been accused of using more lumber than is required for the most economical conduct of their business. Farm experts have repeatedly said that if the farmers would build more barns to house their machinery, more granaries to hold their grain, and better accommodation for their stock, the condition of the agricultural industry would be greatly improved. For this reason the lumbermen point out that it is fair to assume that the amount of lumber which the farmers are using is absolutely necessary to the efficient production of the foodstuffs for which all the entente nations are crying out.

At the present time lumber production—which this year will be about equal in the Mountain district to that of 1916, providing that sufficient labor can be attained for the camps and mills—is not large enough to enable the mills to pile up any real surplus in their yards. Hence, unless men engaged in the industry are exempt the danger is feared that production would soon be so reduced as to cause a shortage in the material the farmers need. The same condition applies with regard to the lumber which is supplied by Mountain mills to the mining industry. Metals are one of war's first essentials. Mining cannot continue without timber; railways also need timber, and railways are an essential industry. Practically all the local consumption of lumber, which last year represented 7 per cent. as far as the Mountain district was concerned, went to the railways and mines. Lumber for shipbuilding comes chiefly from the Coast, but Mountain lumbermen make the point that the necessity for the production of material for this purpose is just as great as in the case of farming, mining, munitions works, and transportation. Whether the 1917 output of lumber from the Mountain district will equal that of 1916 is almost entirely dependent upon the labor situation. If the supply of labor becomes any less than at the present time a lessening of production is inevitable, which would mean that essential war industries would suffer.

Another point in connection with the value of the lumber industry at this critical time is the amount of revenue which it produces for the provincial coffers. In British Columbia, if there were no lumber revenue for the province to fall back upon, provincial finances would indeed be in a parlous state. The industry is doing splendid work in the direction of supporting patriotic funds, the Mountain lumbermen making a monthly donation to the Canadian Patriotic Fund a condition of employment.

Lumbermen in the Mountain section are in favor of conscription, and they make it clear that in declaring for exemption they refer only to men actually engaged in and necessary to the prosecution of the lumber industry. Men who can be of more service to the Empire at the front should go there, they say, but the lumber industry should be placed by exemption tribunals upon the same basis as mining, agriculture, and transportation.

Mills operating in 1916 are operating to-day, as a general rule. There is some fear of floods, which may cause damage and shutdowns at some points in the district, but generally the output for the year is dependent upon the ability of the lumbermen to secure enough labor. At present the labor situation is fair, but there is no surplus.

Says the camp cook:

EDGINGS

Ontario

The Ontario Woodworking Company, Limited, have been incorporated with head office at Kitchener, Ont., and capital stock of $50,000, to carry on business as manufacturers and dealers in wood, metal and paper. The provisional directors are:—D. B. Betzner, E. B. Betzner and O. Hamilton.

The Imperial Munition Board have let contracts for two wooden ships to be built in Ashbridge's Bay, Toronto, by the Russell Contracting Company and John J. Main, of the C. S. Boone Company. The steamers will be constructed of British Columbia fir. The temporary office of the Russell Contracting Company is at 32 Front Street West. When the shipbuilding yard on Ashbridge's Bay has been established the office will be moved thither.

The Mattagami Pulp and Paper Company have nearly completed the 150-ton sulphite plant which they are erecting at Smooth Rock Falls, Ont. It will be in operation in a very short time. Mr. S. R. Armstrong is general manager, and Mr. Jos. G. Mayo, formerly with the company, has again joined it as assistant to Mr. Armstrong.

In the railway committee of the House of Commons recently the senate bill to incorporate the Kenora and English River Railway Company was reported. The company proposes to build a railway from Dryden, near Kenora, to a point on the N. T. R., west of Superior Junction, thence northwesterly across the English River west of Lac Seul. Alex. Smith, counsel for the company, said that the purpose of the railway is to develop a large pulp wood industry. Incidentally there would be some agricultural and mining development. The authorized capital is two million dollars and the head office at Toronto.

The Colonial Lumber Company, Limited, Pembroke, Ont., whose plant was recently destroyed by fire advise us that their loss was well covered by insurance, which was carried to the amount of $76,000. The mill had been running about four weeks and had cut about 3,500,000 feet at the time of the fire. Arrangements have been made with the Pembroke Lumber Company to cut at least 10,000,000 feet for the Colonial Lumber Company this season. Between 3,000,000 feet and 4,000,000 feet of logs are being delivered at R. & T. Ritchie's mill, Aylmer, P.Q., where most of them will be cut this year. The company also report that they hope to be able to rebuild, but whether they will make a start this year or not, has not yet been decided upon. They find great difficulty in purchasing machinery under present conditions, and report that the prices asked are extremely high. The labor problem, moreover, is also making it difficult to work out plans for rebuilding.

The Great Lakes Pulp and Paper Company is being organized, with headquarters at Port Arthur, Ont. The company will erect a 200-ton newsprint mill and will have chemical and mechanical pulp plants capable of producing 350 tons daily. They will have an authorized bond issue of $6,000,000, and at present $4,000,000 will be issued. The common stock will be $12,000,000. This is the company controlling the Pic River and Black Sturgeon River concessions in the Thunder Bay districts. The total area is about 2,400 square miles. The company have contracted with the Hydro Electric System for 20,000 h.p. at $15 per h.p. Among those interested are J. J. Carrick, M.P., Port Arthur; Lieut. Col. Hogarth, Port Arthur; E. B. Ryckman, of Ryckman, Denison & Foster, Toronto; Bermingham & Seaman, of New York and Chicago and others. Bermingham & Seaman will manage the mills and sell the output. The site of the new industry will be on Thunder Bay, just east of Port Arthur, on land owned by J. J. Carrick, consisting of 4,400 acres, of which 800 are water lots. Hardy S. Ferguson, of New York, is the engineer of the company. The Pic River limits are 138 miles from Port Arthur and the Black Sturgeon limits are 75 miles. It is estimated that, on the limits, there are 3,000,000 cords of spruce wood and 2,300,000 cords of balsam and poplar.

Eastern Canada

Fraser Companies, Limited, lumbermen, Plaster Rock, N.B., have obtained a charter.

Dupuy and Frere, lumber dealers, St. Lambert, P.Q., have been registered. Louis and F. X. Dupuy are interested.

The Rhodes Curry Company, Limited, Amherst, N.S., are in the market for a large quantity of one inch hardwood lumber.

The Three Rivers Ship Yard Company (Messrs. Kirkwood & Son) are contemplating the location of a plant at Three Rivers, P.Q.

Fire recently destroyed the mill at Goggin's Siding, N.B., belonging to S. H. White Company, Limited. The loss is partly covered by insurance.

Thos. Nagle, lumber broker, St. John, N.B., reports that he is forming a company to engage in the construction of wooden vessels at St. John, N.B.

The Halifax Shipbuilding Company, Limited, has been incorporated with capital stock of $3,000,000, and head office at Halifax, N.S. The company will

build ships, erect docks, wharves, dry docks, etc. The solocitor for the company is J. B. Kenny.

D. A. Saker, formerly connected with the Imperial Munitions Board, is considering plans for establishing a shipbuilding yard on the site of the Warner Sawmill property at St. John, N.B.

A storage shed, 60 x 180, belonging to William Rutherford & Sons Company, Limited, Montreal, was destroyed by fire on June 29. The building contained a large number of doors and sash, and a quantity of interior trim, together with unfinished stock. The damage is estimated at $25,000, covered by insurance.

Grant and Horne, St. John, N.B., have obtained a contract from the Imperial Munitions Board for the construction of two vessels, and it is expected that this will be followed by other orders. The vessels will be similar to those described a short time ago in the Canada Lumberman. The company are establishing a shipbuilding yard at the head of Courtenay Bay.

Western Canada

The Standard Woodworking Company, Limited, Winnipeg, Man., has been incorporated.

The Fullerton Fawcett Lumber Company, Battle Lake, Alta., have decided to rebuild their mill. Address communications to W. B. Fullerton.

The Pacific Construction Company will build a large planing mill at Port Coquitlam, B.C. The mill and yards will be equipped with the most up-to-date machinery, electric cranes, booms, etc.

Lumber Products Limited has been incorporated with head office at Vancouver, B.C., and capital stock of $45,000, to carry on business as timber merchants, sawmill proprietors, lumbermen and shingle manufacturers.

The Undine Logging Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $10,000, to carry on business as manufacturers and dealers in timber, lumber, shingles, lath, sash and doors, etc.

The Grand Forks Lumber Company, Limited, has been incorporated with head office at Grand Forks, B.C., and capital stock of $50,000, to carry on business as lumber manufacturers; to construct, build and operate sawmills, shingle mills, sash, door and box factories, etc.

The A. A. Plummer Company, Limited, has been incorporated with head office at Vancouver, B.C., and capital stock of $25,000, to carry on business as foresters, timber merchants, sawmill proprietors, etc., and to deal in saw logs, timber, lumber, shingles and wood of all kinds.

The Smith-Hutchinson Lumber Company, Limited, has been incorporated with head office at Victoria, B.C., and capital stock of $15,000, to carry on business as loggers, lumbermen, sawmill men and timber manufacturers; to export and deal in lumber, timber, shingles, railroad ties, piling, pulpwood, etc.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 23rd day of July, 1917, for the purchase of License X989, to cut 2,031,000 feet of fir, cedar and hemlock on an area adjoining S. T. L. 30613, Butterfly Bay, Mayne Passage, Range 1, Coast District. Two years will be allowed for the removal of the timber.

The Ruby Lake Timber Company, Limited, has been incorporated with head office at Victoria, B.C., and capital stock of $10,000, to carry on business as sawmill owners, timber and lumber merchants, and manufacturers of and dealers in lumber, timber, lath, shingles, sash and doors, etc., and to build sawmills, pulp mills, logging railways, logging camps, etc.

The North Coast Spruce Mills Limited, have been incorporated with head office at Vancouver, B.C., and capital stock of $48,000, to carry on business as manufacturers and dealers in wood pulp; to erect and operate shingle mills, sawmills, planing mills, wood pulp mills and wood factories of all kinds and to carry on the business of foresters, loggers, timber and lumber merchants, etc.

The New Westminster Construction and Engineering Company, Limited, has been incorporated with head office at New Westminster, B.C., and capital stock of $30,000, to carry on the business, among other things, of woodworkers, timber merchants, lumbermen, loggers, sawmill, shingle mill, pulp mill, and paper mill proprietors, and as manufacturers of and dealers in saw logs, timber, lumber, shingle bolts, piles, wood and paper of all kinds.

The loss by fire at the planing mill and box factory of the Cameron Lumber Company, Limited, Victoria, B.C., recently, amounted to approximately $80,000, of which $25,000 will be recovered in insurance. The loss included about 20 carloads of box shooks which were waiting for shipment. The company advise us that they will rebuild immediately. They have commenced to clear away the space and have received drawings for the new building. Some of the machinery is already on the way.

A Vancouver despatch states that the Red Cliff Land & Timber Company is asking for foreclosure against 21,000 acres of timber land in the Alberni district, sold to Alvo von Alvensleben in 1911, the payment extending over ten years. The cash payment was $230,000 on a total of $2,228,700, and subsequent payments were made to an aggregate of about $1,700,000. The plaintiffs are now suing for $525,723, being the total amount now owing. Some time ago this action came up and an extension of time was granted in view of the fact that other interests had liens, etc., against the property.

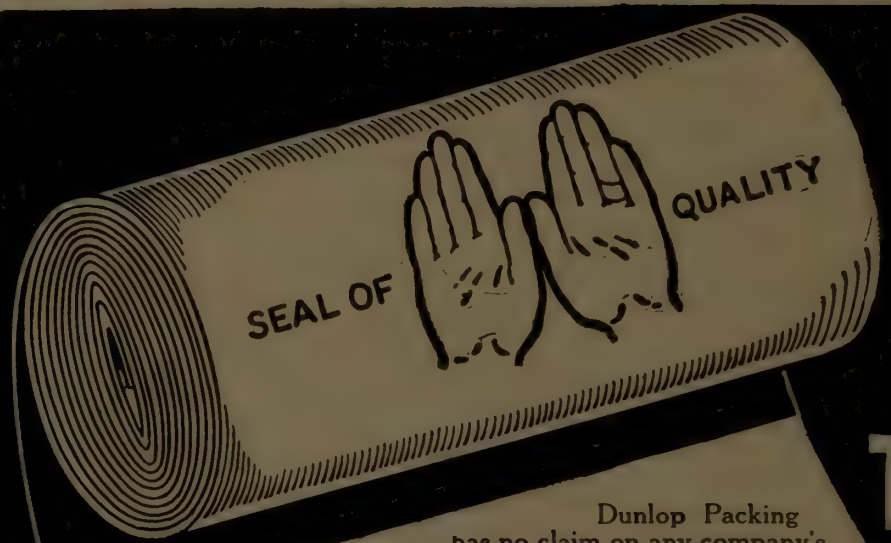
DUNLOP



PACKING

PICTURE THIS PACKING IN YOUR PLACE

Dunlop Packing has no claim on any company's enthusiasm except by reason of its ability to do the work assigned to it, and to be there in the "pinches."

Ever-Increasing Demand

Every day Engineers and Mechanical Superintendents are realizing that the remarkable increase in the demand for Dunlop Packing is accountable for in only one way—by consistent service, persistently kept up.

Dunlop **"Sunset"** Sheet Packing (red) has that desirable flexibility which ensures the necessary "life" in a packing. Its remarkable tenacity holds in the hottest joints.

"LongLife" and "Globe" Spiral Excel in Service

Dunlop **"LongLife"** and **"Globe"** Spiral Piston Rod Packings take quality precedence over competitive brands, because we make them, like **"Sunset"** Sheet, to a standard—and that standard was created by critical buyers like yourself. Wherever these packings are used, Engineers are complimented on the continued efficiency of their plants. No blowouts, no frequent adjusting, no loss of power due to friction—when Dunlop **"LongLife"** and **"Globe"** Spiral Packings are used.

We, also, make Valves and Diaphragms of excellent quality.

Wasted Time Eats Profits

THESE two classes of employees are always gnawing at your profits — "early outs" and "lates" on the pay-roll of any plant. You must account for the minutes you buy just as you account for the dollars and cents that you handle.

Have you ever tried to figure out what the "wasted" time in your factory—costs You?

An International Time Recorder will keep an accurate record of each employee—a record made by the employee himself, on his own time and one that he cannot dispute.

The International promotes satisfaction and contentment for all concerned—it "rings" a square deal for everybody.

Of the many styles of Internationals there is one particularly suited to your needs. Prices range from $135.00 up.

Economical Exhaust Fans

Sturtevant fans are made in different designs—each type for its own work.

The Design 2 wheel has a very large blade area and instead of the blades having a regular progressive curve they are made up with a series of forward bends. For conveying refuse this fan requires less power than any other fan made.

Talk it over with one of our engineers. He will tell you just which design is best suited to your work.

A postal will bring Catalog 185-C.

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir
Red Cedar Shingles
Hard Pine
Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

Branches: Toronto, Winnipeg

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

GOODHUE BELTING For

Saw and Planing Mills

In a Goodhue Belt you get only the best leather with the stretch taken out of it. A Goodhue Belt will always run evenly and "clings" to the pulley transmitting 100% of your power

For the wet places in the mill we have a special waterproof leather belt—"Acme." Other Goodhue Belts are "Extra" and "Standard" recommended according to the conditions under which the belt has to run.

Goodhue Belts stretch less than any other belt by 15 to 25 per cent.

EST. 1880 "FACTS FIRST"

James D. Lacey & Co.

EXPERIENCE : RESOURCES : PRECISION

Timber, the Greatest Investment of the Day

While the ghost of "timber famine" has been pretty thoroughly laid, the records of the past and the certain trend of the present show beyond question that the rising of the sun is no more certain than the steady advance in value of all good timberlands bought right.

A LACEY REPORT on a tract will guarantee the goodness (if it be there) and our 37 years' experience of sound dealing will assure the buying right factor.

We have or know where to get what you desire.

Send for our interesting booklet.

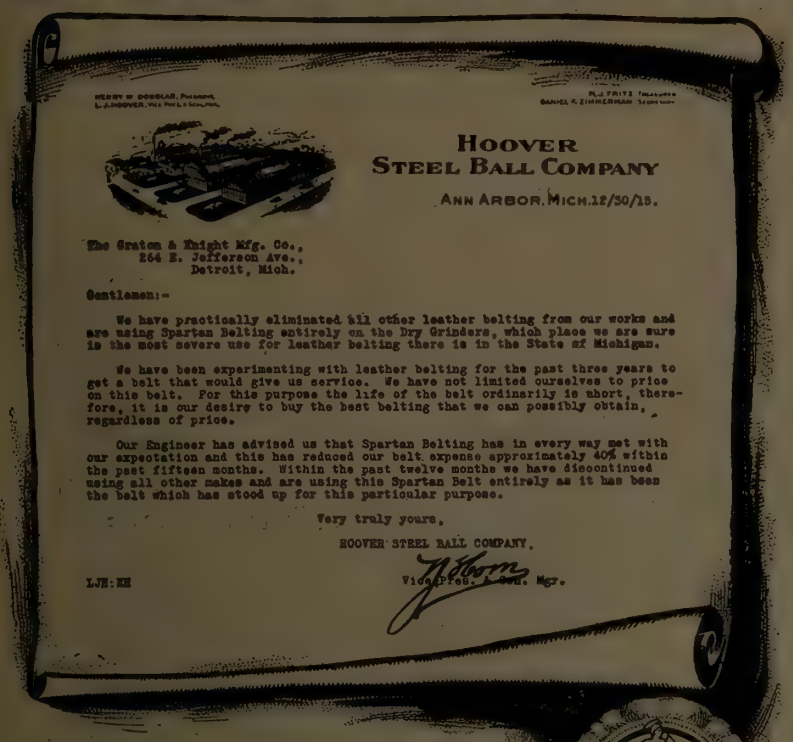
BELTING EXPENSE REDUCED 40%



HOOVER
STEEL BALL COMPANY

ANN ARBOR, MICH. 12/30/16.

The Graton & Knight Mfg. Co.,
264 E. Jefferson Ave.,
Detroit, Mich.

Gentlemen:-

We have practically eliminated all other leather belting from our works and are using Spartan Belting entirely on the Dry Grinders, which place we are sure is the most severe use for leather belting there is in the State of Michigan.

We have been experimenting with leather belting for the past three years to get a belt that would give us service. We have not limited ourselves to price on this belt. For this purpose the life of the belt ordinarily is short, therefore, it is our desire to buy the best belting that we can possibly obtain, regardless of price.

Our Engineer has advised us that Spartan Belting has in every way met with our expectation and this has reduced our belt expense approximately 40% within the past fifteen months. Within the past twelve months we have discontinued using all other makes and are using this Spartan Belt entirely as it has been the belt which has stood up for this particular purpose.

Very truly yours,

HOOVER STEEL BALL COMPANY,

LJH:EH

Spartan Belting is daily proving its efficiency in plants of every description—proving it so conclusively that Spartan is fast becoming the universal equipment for all drives where the physical conditions are quickly ruinous to ordinary belting.

The use of Spartan Belting in your mill will mean the solution of your Hard-drive problems—it will mean greater, more efficient and more economical service. Why not select one or more of your difficult drives and put Spartan to the test?

THE positive uniformity of grit and grade—the certainty of duplicating successful wheels—has made the Aloxite Saw-Gumming Wheel the standard of many a big sawmill.

Once you get the right wheel in the right place, once you let us send you an

ALOXITE SAW-GUMMER

—the wheel that will cut free, fast, and cool without case-hardening the saw—you can rest assured of getting another just like it—a dozen or a hundred more, as like as two peas in the pod—Aloxite—the wheel for steel.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

No. 3 Bolter

One of the main reasons for the great popularity of our No. 3 Bolter is its capacity for continuous work.

The machine is so substantial in all the essential parts—frame, bearings, etc.—that you seldom see the slightest trouble develop.

Another reason is the uniform, accurate work turned out under all conditions. In large mills where they produce large quantities of lath, etc., our No. 3 Bolter is almost universally used.

The machine has our usual one-piece frame construction, with all bearing and working parts easily accessible for adjustment, etc. Carries four 20-inch saws, spaced ordinarily for lath bolts, but can be arranged for any spacing of saws for cutting slats, pickets, etc. Floor space, 5 feet x 4 feet 6 inches; weight, 2,800 pounds.

Send for detailed description and dimensions.

Catalogue No. 102

This mark on your saw mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

The E. Long Manufacturing Co., Ltd.

Orillia - Ontario

An Edger for 6" Cants

You can put a 6-in. cant through this edger and know that it will come through edged to a hair. Edger carries 22-in. saws, 6-in. saw collars, leaving 7-in. clear saw blade, more than enough margin for 6-in. stock

Mandrel is 3⅞-in. in diameter, the three bearings that support it are each almost 10-in. long—the rest of the machine is built in proportion. That's why Waterous New Champion Edgers can be crowded to the limit and will turn out full capacity, day after day, without straining.

Notice the feed rolls, two before and two behind the saws. They are machine fluted to give a firm, secure grip on the timber that holds it fast, but will not mar it in any way.

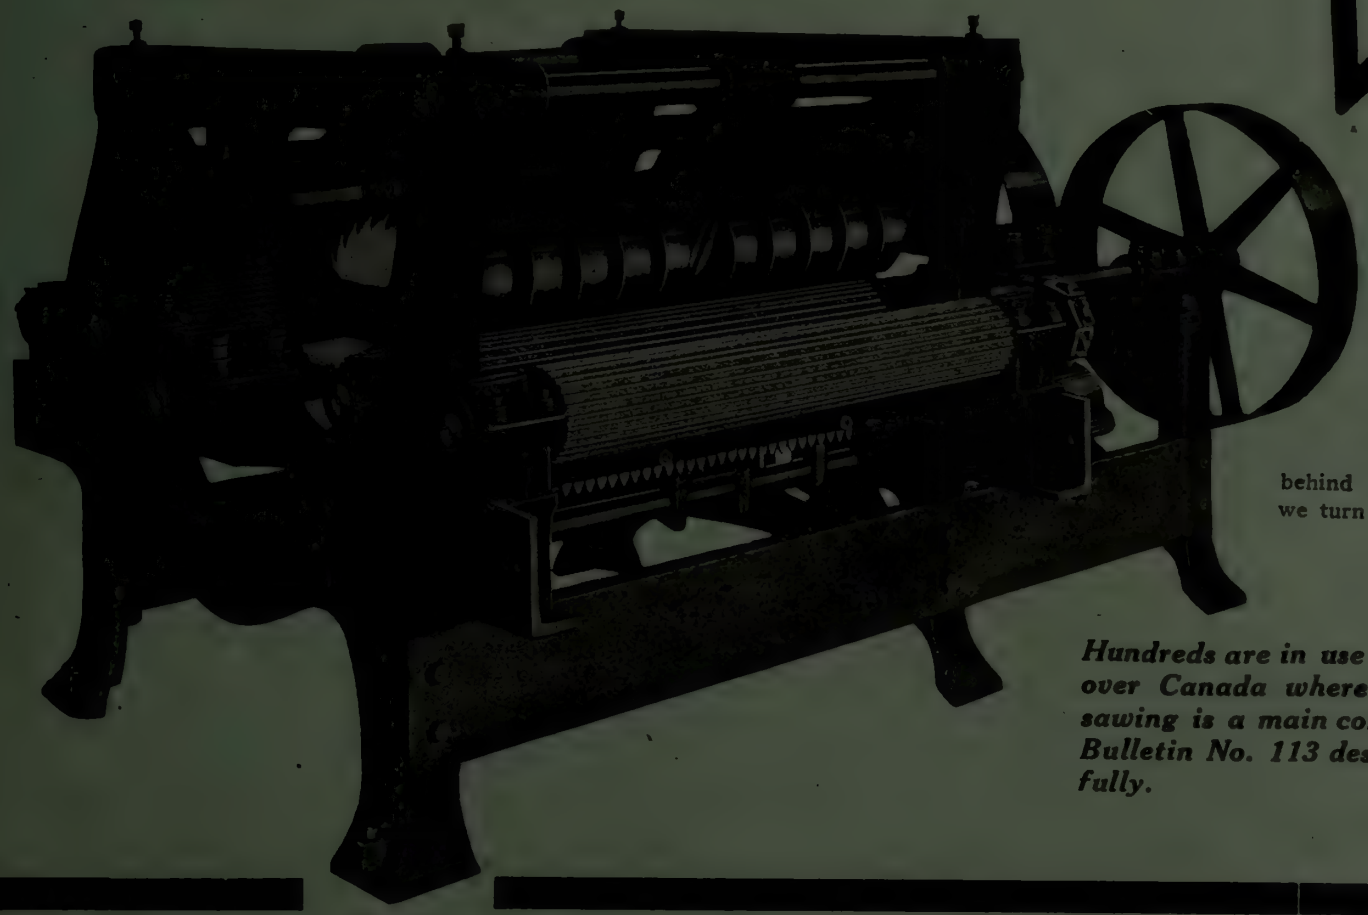
The press rolls are divided, too, making both sides of the machine independent of each other. It's a worth while feature, decidedly.

We build up-to-date Machinery for Sawmills of every capacity—circular or band
Catalogues on request

WATEROUS NEW CHAMPION EDGERS

are built with 40", 48", 56", 60" and 72" opening. They carry as many as four movable and two stationary saws without difficulty.

These edgers cut true and to dimension at all times. The guides are rigid and cannot shift in the cut. They are crowded to correct position and held immovably in place by a steel setting gauge that drops upon them. *No other edger has this feature.*



Waterous New Champion Edgers are fast and accurate cutting, easily operated, and perfectly safe. We stand behind every machine we turn out.

Hundreds are in use in mills all over Canada where quality of sawing is a main consideration. Bulletin No. 113 describes them fully.

The Waterous Engine Works Co., Ltd., Brantford, Canada

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 40c per lb.; West of Fort William, 45c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

LIDGERWOOD SKIDDERS

The Most Modern Machines

for

Skidding Logs of All Sizes

We build skidders for every condition and will send expert logging men to look over your timber lands and advise you what type is best suited to your work.

Lidgerwood Machines were the pioneers in steam logging and have been constantly improved to meet the advancing requirements of lumbermen.

Lidgerwood Skidders are the only skidders provided with interlocking drums and with a mechanical slack puller.

Portable High Spar Overhead Skidder

Portable Ground Skidder

Tree Rig Ground Skidder

A statement of what logging is costing at any particular operation, without taking into consideration the local conditions, and without considering every element of cost from the felling of the tree to delivery at mill, is worthless.

In deciding the cost of skidding by any type of machine not only should the cost of operating the machine be considered, but the amount of timber that will be skidded at each setting, the railroad construction necessary, and time lost in repairs.

We have paid special attention to the construction of Cableway Skidders required by conditions in British Columbia and the most successful machines now in use in that province were installed by us.

"READY TO SERVE"

Whether you are "fighting for business" or "fighting the Turk," you have got to have the ammunition. The bayonet has won battles, but not wars—the "high-speed" talkative salesman gets your hearing, but not much of your business. In other words, if you expect to consolidate your gains in the battle of business activity, you must have the goods.

When it comes to lumber, we are "ready to serve" you, and have been

"SPRUC-ing UP"

Here are some high explosive shells we want to unload:

Province of Quebec

TIMBER LANDS

Timber Lands

License or permission to cut timber on public lands in this Province is acquired at public auction, after due notice has been given, subject to a yearly ground rent of $5 per square mile, and is renewable annually, provided the licensee shall have complied with the regulations.

The timber cut in virtue of such license is subject to a tariff of dues fixed by order in council.

The present rate of ground rent and tariff dues shall not be increased until the 1st of September, 1920.

Licensees are forbidden to cut on Crown lands trees less than a fixed diameter.

The Regulations also provide that all timber cut on Crown lands must be manufactured in Canada.

In the event of a licensee wishing to transfer his rights, he is at liberty to do so under certain conditions, namely, the paying of a fee of $4 per square mile.

There are at present time about 75,000 square miles of forest lands under license and over 150,000 miles in the possession of the Crown.

WATER POWERS

Water Powers

To obtain authorization for the utilization of a Water-Power in the Province of Quebec, application should be made to the Honourable Minister of Lands and Forests.

Water-Falls capable of developing over 200 H.P. are granted under emphyteutic leases, the conditions of which are upon the following lines:

1.—Duration of the lease, from 25 to 99 years, according to the importance of the water-power and to the amount of capital required for its development.

2.—Payment of a yearly rental which does not vary during the term of the lease, for the land granted, counting from the date when the contract was signed.

3.—An additional yearly charge of from 10 to 35 cents per H.P. developed according to the geographical situation of the site of the water-power; such charge being payable from the time the power is produced.

4.—The above charge is subject to revision every 21 years, counting from the signing of the contract.

5.—Delay of 2 years for beginning works and 2 further years for producing power.

6.—The lessee to make a deposit in money or in securities as a guarantee of good faith of the carrying out of the contract. Such deposit may be forfeited if the conditions are not fulfilled; but it may be repaid after a certain time, in the contrary case.

7.—Lastly, the grantee must submit plans of his works, mills, etc., to the Department previous to their installation, and, when such installation is completed, he must keep the Department informed as to the quantity of power produced.

Department of Lands and Forests
of the Province of Quebec

Elz. Miville Dechene,
Deputy Minister

Galbaduk TRADE MARK

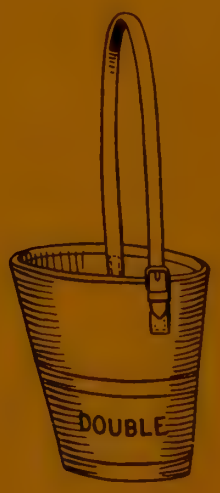
A Smart-Woods Product

The above trademark on your Horse Covers, Tarpaulins, Tents, etc., is a guarantee that you are using a "watertite" canvas of highest quality. A canvas absolutely waterproof and protected from mildew and decay through a special process, machine applied, that penetrates every fibre of the canvas, strengthens every thread, and suitable for every purpose where a "watertite" duck is required. "Galbaduk" is made in Green and Brown. The color won't rub out; the longer it is in use the more solid the color becomes. **Sample book and catalog will be mailed upon application.**

Style B Horse Cover

Horse Covers in three styles; hames to tail fitted with breaching straps and hame, breast to tail with breast and breaching straps, hame leathers and rein holes, and loin covers for heavy dray horses. Green or Brown Shades, and always ready in stock for shipment. Get our prices.

"Galbaduk" Tarpaulins—soft, strong, durable and watertite. Protect your stock from the elements. Made to withstand rain, snow, or sleet. Send for samples.



"Galbaduk" Feed Bags and Water Buckets

Farmers, Teamsters, and others who are constantly driving long distances should always carry one of our handy folding **"Galbaduk" Feed Bags and Water Buckets.** Saves much time and labor, and fits in anywhere, under the seat or in any corner of the wagon or buggy.

The James Morrison Brass Mfg. Co., Ltd., 93-97 Adelaide Street West TORONTO

The Acid Test

The placing of any article under the severest strain of use to determine its maximum value for which that article is specially adapted, might be termed the "acid test" of efficiency.

"Lion Brand" cordage will stand the "acid test" like the British Army. "What it has it holds."

"A chain is no stronger than its weakest link." This adage may be applied to rope. If there are any "weak links" in your rope, it isn't "Lion Brand."

Ninety-two years in the manufacture of cordage is a fact to consider when you purchase your supply of rope or lath yarn. Every year of that time has been utilized in endeavoring to make our cordage 100 per cent. efficient. Every bit of hemp, from the time it enters the "breaker" until it is a finished product, has the critical attention of our experts. We make it second to none.

Solve your transmission problems with "Lion Brand" rope, and keep in mind we manufacture the highest grade of lath yarn. We have rope for your every purpose.

"Lion Brand" is a "made-in-Canada" product. That means something. Europe has learned that the human parcels wrapped in khaki which come from Canada are put together to stand the "acid test," and they do.

"Lion Brand" is a "Canada" brand, and stands for the traditions of Canada.

BATHURST

Car Famine Coming

SOON Canada and the United States will be face to face with the beginning of the greatest car shortage in their history.

Added to this will be a serious labor famine. The harvesting of the crops this year is a matter of vital necessity, and as a large proportion of the men employed in lumber mills and yards are also workers on the land, thousands of them will be withdrawn from lumbering pursuits and sent harvesting.

At present the car service is comparatively fair, although far from satisfactory, but before long there will be neither cars to load nor men to load them.

Most urgently do we ask our customers to place their orders now for rush shipment of their Fall and Winter requirements in Lumber and Shingles.

Forewarned is forearmed. Wire or 'phone your orders while we can make shipment.

Alleged Profits of The William Davies Company in 1916 on Bacon, as Indicated by Department of Labor to be Five Cents per Pound, Untrue:

Actual Profits Two-Thirds of a Cent Per Pound

THE statement issued by the Department of Labor concerning the business of The William Davies Company Limited has been given widespread circulation throughout the country and provoked public unrest.

Whatever the technical wording of the report was, the effect has been that the newspapers have published that "the profits on Bacon alone" of this Company "for 1916" were about "five millions of dollars." This interpretation of the official report is not surprising in view of certain statements that the Commissioner of the Cost of Living makes. The Commissioner is reported as saying that "There were two individual cases of profiteering in 1916 and that had these cases occurred since the passage of the cost of living Order-In-Council, he would consider it his duty to recommend that the facts be laid before the Attorney-General for consideration as to their criminality." The situation created by such erroneous and damaging statements is serious as emanating from a Government Official, from whom one looks for not only accurate statements but correct conclusions.

The William Davies Company, being a private concern, has followed the practice of all private corporations, except when it made a bond issue in 1911, in that it has not published reports of its assets and liabilities or profit and loss. The present circumstance, however, in which a Government Official has led the public to false conclusions, makes it advisable for this Company, for both the public interest and its own interest, to publish particulars of its business as well as point out the error of the statement of the Government Official.

For the last fiscal year ending March 27th, 1917, The William Davies Company bought and killed 1,043,000 head of Live Stock (Cattle, Hogs and Sheep). This, plus purchases of outside Meats, produced 160,000,000 pounds of Meats. The Company handled 6,550,000 pounds of Butter and Cheese, 5,650,000 dozens of Eggs, and manufactured 26,500,000 tins of Canned Goods.

The net profits on these were .68 cents (or two-thirds of a cent) per pound on meats, 1.04 cents on Butter and Cheese, 1.04 cents per dozen on Eggs, and .47 cents (or slightly less than one-half a cent) per tin on Canned Goods. These profits include profits on all By-Products derived from these accounts.

During the year the Company served at its retail stores 7,500,000 customers, the average purchase of each customer was 35c., and the net profit upon each sale was 5/8 of 1 cent.

The turnover of the Company from all its operations for the last fiscal year ending March 27th, 1917, was $40,000,000. The net percentage of profit upon this turnover, after deducting war tax, was 1.69 per cent., or including war tax 3.45 per cent.

The William Davies Company has assets of $13,385,000, of which $3,865,000 is tied up in fixed investments.

To provide the necessary facilities for the increased volume of business the Company expended $750,000 in buildings and equipment during the year.

Companies of other character present no more reasonable statement of profit and loss based upon the investments made in the business.

The William Davies Company offered to the Imperial authorities as well as to the War Office Service (which represents the Imperial authorities in Canada) to place the output of its Factory with respect to Bacon supplies, Canned Beef and Pork and Beans at the service of the authorities, on the basis of cost plus an agreed percentage. These offers were successively declined as the authorities evidently desired to purchase in the open market, and on this basis The William Davies Company has secured War Office business by open competition with the world.

Respecting the Report of the Commissioner on the Cost of Living:—

Last Winter the Commissioner, under authority of Order-in-Council, required packers to submit statements under oath for some years back and up to December 1st, 1916, of incoming stocks of meats and the cost of such, as well as statements of outgoing product and the selling value. This Company represented in writing at the time that the information as specifically required was not in accordance with Packing House Accounting methods, and invited the Commissioner to send an Officer to the Head Office of the Company to examine the books for any information desired, and to secure a viewpoint as to the best way of collecting data which would be of use to the Government. This offer was declined, and there was nothing to do but fill in the information required as literally as we could determine it. For example, there was no recognition of the fact that a raw product may enter a factory under a specific classification and leave the factory as a finished product under some other classification.

We submitted a series of accurate figures based upon our interpretation of the official requirements which made no provision for charges of any description other than incoming freight and unloading charges to be included in the cost or to be deducted from the selling price. There was nothing in the report which could be read so as to determine a profit and loss statement. The very fact that with only a statement based upon cost of raw products and value of sales in Great Britain a Government Official has deduced "Large margins," "Profiteering" and "Criminality" if it had occurred since the passage of a recent Act, shows too dangerous a trifling and incapacity to be permitted to deal with any important situation. The statements of this Company have been treated by the author of this report as if the outgoing product was identical with the incoming product, and from the series of reports he has singled out two items—the Bacon and Egg reports—and from them deduced an erroneous "margin"

Continued on Next Page

Continued from Preceding Page

which the newspapers have interpreted as "profit." The author of the inquiry shows a strange lack of even a fundamental knowledge of simple bookkeeping and a dangerous inability to co-ordinate figures. The following are specific and outstanding errors in the report:

The principal item that is causing excitement deals with cold storage Bacon. The term "cold-storage" is not defined, and the public is allowed to make its own definitions. As all Bacon in a packing house is under refrigeration it is really all cold-storage, and therefore this Company's figures of cold-storage Bacon represent the complete quantity of Bacon handled in its entire Plant, whether in freezers or in process of cure for immediate shipment. That some Companies interpreted cold-storage product as "freezer" product only is evidenced by the smallness or entire lack of figures on the Bacon list for some Plants, indicating that many Firms did not submit statements of their complete stocks, as did this Company. An Official of this Company pointed out this cold-storage distinction to Mr. O'Connor and Miss McKenna in Ottawa a few weeks ago, and the failure to make the distinction after having had it pointed out evidences lack of desire for accuracy of the real information desired.

It is true The William Davies Company, in 1916, exported 97,791,000 pounds of Bacon, but we do not know how the margin of 5.05 cents per pound is arrived at by Mr. O'Connor, as there were no figures to justify such a conclusion. The probabilities are that the margin is arrived at by taking the average cost per pound of incoming product from the average selling price per pound of outgoing product. This may be a rough way of estimating the gross margin when dealing with small figures, but when dealing with figures the size that Mr. O'Connor has to deal with, a very small fraction of a cent per pound of error makes a very important difference in the total, and one must be careful to make sure that the outgoing product is the same finished merchandise of the incoming product reported on.

Allowing it to pass, however, as a rough estimate, we wish to point out—(first)—the inquiry of the Commissioner allowed only for incoming freight and unloading charges, and made no provision whatsoever for operating charges of any kind, such as labor, curing materials, refrigeration, etcetera. Such actual charges on the 97,791,000 pounds exported were $1,162,000—or 1.2 cents per pound. This amount covered all charges up to the point of placing the Bacon on cars f.o.b. packing-house. In addition to this was the actual cost to land and sell this 97,791,000 pounds in England after leaving the packing house, which involved charges of 2.9 cents per pound—or $2,836,000. This 2.9 cents per pound included inland and ocean freight, landing charges, war and marine insurance, cables, and selling commission to agents. The ocean freight and war risk alone would make up 2.4 cents of the charge of 2.9 cents per pound. This 1.2 cents, plus 2.9 cents—a total of 4.1 cents—must be deducted from Mr. O'Connor's margin of 5.05 cents per pound, leaving a margin of .95 cents, or slightly less than a cent per pound, which still has to be reduced because of the error of premises and because of further factors which have to be considered to determine net profits.

It is quite evident some of the other packers did not show selling values in the country in which the goods were sold—a proceeding quite proper, as the forms submitted to be filled in were indefinite and ambiguous, thus permitting without charge of evasion a variety of interpretations as to the information required. It is thus possible that of all the figures submitted by the different packers that no two sets of costs and sales prices are determined at the same common point. It is this difference of interpretation of what was required that accounts for the difference of the alleged "margin" made by the different companies. Common conclusions, however, have been drawn by the author of the report from varying bases of premises.

The figures of the Egg business were submitted on the same basis as Bacon, and similar deductions must be made.

(Second)—The above margin is further reduced in that the author of this inquiry singled out the Bacon figures as an item in which the selling price shows an alleged improper advance over cost, but he did not give us credit for the statements of other products, of which figures were submitted, the selling prices of which were under cost. The reason of this was that, through failure to inquire, the Department entirely overlooked the fact that product may come in as pork, and, through the process of manufacture, go out as Bacon, or, in another instance, enter the factory as beef and go out in the form of canned meats; for example: much of the product which came in as pork, and which was entered on the pork sheet submitted to the Commissioner—about which he makes no mention—was cured and left the factory in the form of Bacon, and was, therefore, entered on the outgoing side of the Bacon sheet—the result is that the Bacon sales are increased by this amount over the incoming stocks of Bacon, and, likewise, the sheet showing sales of pork is reduced by the amount that went out in the form of Bacon. If the Department takes one set of figures that show favorably to the Company they should take another set of figures that show unfavorably, as the principle in either case is the same, and failure to do so looks as if the author of the report was exercising more enthusiasm than sound judgment in his investigations.

(Third)—It is queried in the report, that "if the margin of 3.47 cents," alleged to have been made in 1915, "was satisfactory, why was it necessary to show increased margin in 1916?" Assuming again for the moment the soundness of the premises in asking such a question based on an erroneous "margin," it will be found that the increased margin is chiefly absorbed in increased ocean freight rates and war risk insurance in 1916, of which apparently the author of the report was in ignorance.

The Company does not challenge either the legal or moral right of the Government to investigate business enterprises when public interest directs such an investigation should be made. If an investigation of the packing and meat business is ordered, the Company will place at the disposal of the Government not only the data it would be required to supply under Order-in-Council directing that inquiry be made, but will place the experience of its officers at the disposal of the investigating committee, if it is considered they can render any service which will be of value. The Company has not now—nor at any time during the fifty years of its operation—anything to conceal in method or practice of carrying on its business. It does, however, claim the right to conduct its export business without abusive comment from Government civil servants—especially when the conclusions drawn from the data asked for are improper and false.

One of Canada's chief export industries is the packing business. It is esential to the live stock industry, and, along with other export industries, it maintains the financial stability of this country and should, providing it is on a sound basis, receive encouragement and not slanderous abuse. In view of the publicity given to the report of the Commissioner on the cost of living, the Company demands the same publicity in having an official Government investigation of this report to determine the truthfulness or untruthfulness of its conclusions. We do not seek public consideration as a company, but we do say that untruthful official statements, or statements the effect of which is to create an untruth, adversely affect the live stock industry of this country, which is so valuable and essential a wealth-producing power, and, in the long run, are harmful to the very people that the statement seeks to benefit.

If the passing out of existence of a corporation such as The William Davies Company, or if nationalization of packing houses would materially and permanently reduce food prices, then in view of the present world tragedy it ought to be consummated without delay. The fact of the matter is, however, that with millions of people in Europe turning from producers into consumers because of war, and the tremendous destruction of food products incident to war, there is no remedy for the high prices of food while such conditions last, except the remedy of thrift and increase of production.

Long before there was talk of a Food ontroller in the United States or Canada The William Davies Company urged the Government at Ottawa, in writing, to appoint a Food Controller with full power to do what he saw fit, as we realized at that time the upward tendency in the price of food commodities unless checked by official effort. At the most a great deal cannot be done in reducing food prices while currency is inflated and until the scale of prices of all kinds of commodities declines also. What can be done can only be done by a Food Controller. We wish to point out that nothing at all can be accomplished unless the data secured are accurately and clearly made and the deductions therefrom sound. Only public harm arises from dangerous incompetency in the haphazard collection and careless use of important figures.

As far as The William Davies Company is concerned this terminates all public statements of the Company, and it will pay no more attenttion to speculative and haphazard statements made either by newspapers or civil servants. The only further statement that will be made will be at an official investigation.

The Corbet Automatic Double Cylinder Steam Towing Machine

Made in four sizes, accommodating Flexible Steel Hawsers from ¾-in. dia. up to 1½-in. dia.

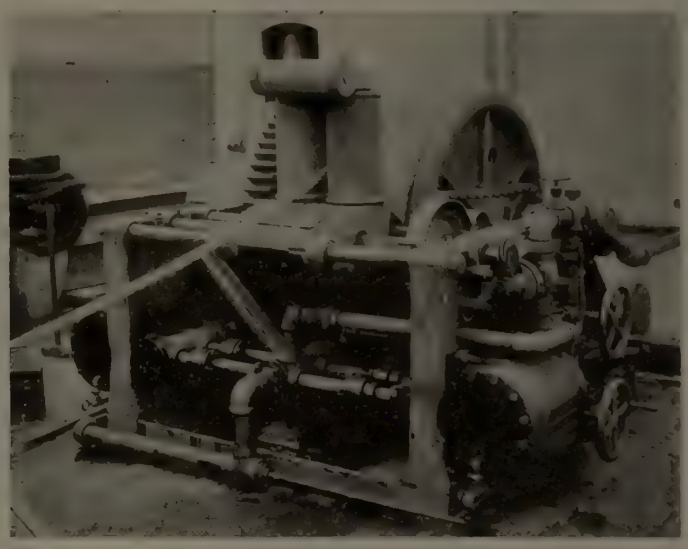
A large number of our machines are installed on Tugs on the Atlantic and Pacific Coasts and on the Great Lakes.

They increase the efficiency and earning power of the Tug.

Does away with having to buy new Manilla Towing Hawsers every spring.

The Steel Hawser will last at least 10 years.

Keeps the crew contented and gives perfect satisfaction.



Read what one of our Customers says.

"TESTIMONIAL"

THE MIDLAND TRANSPORTATION CO.,
Midland, Ontario.

Messrs. The Corbet Foundry and Machine Co., Ltd., Owen Sound, Ontario:

Dear Sirs,—I have pleasure in reporting to you that the No. 3 Automatic Steam Towing Machine, which has 1,350 ft. of 1¼-in. dia. Flexible Steel Hawser on it, which you installed on the tug "Lucknow" this spring, has been satisfactory in every way. The machine has sufficient power to haul the cable in at all times while the tug is working ahead. The Automatic Valve works well when in bad weather, and we find no jerk on the cable. This machine is a big improvement and safer than the Manilla line.

Yours truly,
THE MIDLAND TRANSPORTATION CO.,
Per Capt. E. F. Burke,
Pres. and Gen. Manager.

ASK YOUR JOBBER

How long will Consumers pay the increased cost of *Extravagant* Manufacturing?

Over $2,000,000 a week losses from inefficient power transmission alone

Are you guilty of extravagance in your plant?

Wastage of power in your saw mill spells less profit, with lower production. Conserve on your power transmission, and you have solved a great leakage in the effectiveness of your mill.

Inferior belts detract from the efficiency of your plant. Steel rails are expensive, yet imperative to every railway.

LEVIATHAN ELEVATING TRANSMITTING CONVEYING BELTING

Leviathan and Anaconda Belts are made to increase your production with least waste of power transmission.

They are a "saw mill" belt—made for your heavy drive—made to stand the ravages of time, moisture and acid fumes.

LEVIATHAN ELEVATING TRANSMITTING CONVEYING BELTING

Leviathan and Anaconda Belts are replacing more costly belts every day, and then outlasting them in actual length of satisfactory wear.

Conservation is our motto to-day—see that you are conserving on your power transmission. USE LEVIATHAN AND ANACONDA BELTS.

Ask to be put on our mailing list for our monthly booklet, full of live information on Belting.

WATEROUS

"NEW MODEL"

BAND MILLS

Built in 8, 9 and 10 ft. sizes, there's a Bandmill for every kind of work.

The spring-cushioned, all knife edged tension device is the most sensitive in use.

Upper and lower guides swing about the exact centre of the saw blade.

The Upper Guide is raised and lowered by steam, an easy, accurate and swift adjustment unequalled by any other.

Wheel raising device and tilting device are roller bearing. Operating mechanism is entirely enclosed in columns. Sawdust and slivers cannot reach it.

Massive design of the bed and columns precludes vibration during cutting. This mill is absolutely steady doing the heaviest work.

Every part of the mill is designed to make mill-wrighting easy. Adjustments and inspections can be made without difficulty.

Waterous Bandmills are designed and built in a plant that has specialized in the manufacture of Canadian sawmill machinery for more than 50 years. It counts.

You can easily see the value

Any careful business man can see the value of using only the best grade of leather belting. Belting that has been made specially for the conditions in the mill. Saw and Planing Mills, Lumber Machinery of all kinds require leather for the best results.

Goodhue Belts

The green sawdust, moisture and oil have no effect on Goodhue Waterproof Leather Belting. We can point to satisfactory records in many large Lumber Plants and Woodworking Mills in all parts of Canada. In the Maritime Provinces, in Quebec and Ontario, and right on through to British Columbia, you'll see Goodhue Waterproof Leather Belts running year after year, with little or no attention. We make three brands, each the best in a special condition.

FOR SALE

Standing Timber

in Large or Small Blocks

and

Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery For Sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.
1 Double cylinder steam nigger, right hand.
1 Log Loader for right hand mill.
1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.
1 left-hand steam nigger.
1 Log-loader.
1 Endless chain jack ladder with two kickers complete for right and left hand mills.
2 Roger Gang Edgers for 8-in. cants and lumber.
1 Waterous double edger, 6 saws.
1 2-saw Trimmer.
1 20-ft. Slash Table.
1 16-ft. Revolving Slash Table
1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.
1 Lath Mill with bolter.
2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.
5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
2 125 h.p. Water Wheels.
1 Upright Engine for sawdust conveyor.
1 10 h.p. Engine.
1 Wood Machine for 22-in. wood.
1 Edger for ripping dry lumber, installed.
1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

SPECIAL BELTS

D.K. McLaren LIMITED

Special Belts for Special Drives

"The belt that drives the machinery rules the plant."

An ordinary belt means smaller production, less profits, and greater upkeep. Is your belt an ordinary belt?

D. K. McLaren's British Oak Tanned Leather Belts are driving the machinery in some of the largest sawmills and woodworking plants in Canada, and are standing the test of efficiency. Being oak tanned, selected from the highest grade of hides, and so manufactured that all stretch is eliminated, our belts are made for your every purpose.

MORE GRIP—LESS SLIP. D. K. McLaren's Belts are made to grip. You will be transmitting maximum amount of your power with our leather belting—that means low upkeep and higher production.

Let us put you in touch with some users of our belting. Write to-day.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.
Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 Toronto, August 1, 1917 No. 15

1917--Outstanding Features of the Year's Trade—1918

A year ago, when the logging season of 1916-17 was facing the lumber manufacturers of Canada, the "Camp Supply" number of the Canada Lumberman was published and the introductory article dealt with the situation as it then appeared, drawing from it such impresions as seemed reasonable regarding the year that was approaching. That year is now a matter of history and there are some in the lumber business who would care to see it repeated, although many have realized record prices for their stocks. It has been a year of difficulties and uncertainties and yet a year in which the lumber trade and industry have been able to settle down a little more firmly upon a sound and safe basis.

Two important facts stand out when we look back upon the year that has passed. The cost and the difficulty of producing, shipping and marketing lumber have increased greatly, and the prices of lumber have advanced considerably. Other things have occurred which have affected conditions in one part of the country or another, but everywhere these two things have been the chief developments of the year. Moreover, the same problems of operating cost and price of the finished product must continue to hold sway as the determining features in connection with the results to be secured during the logging season of 1917-18 and the manufacturing season of 1918. It is hard to imagine anything at present that is likely to reduce the high cost of labor and materials required in the woods, and it seems reasonable to expect that the prices of lumber during the rest of 1917 and during 1918 will continue high.

In eastern Canada the matter of chief importance to the trade has been the situation in Great Britain. The lumber industry in the Maritime Provinces and Quebec has been built up upon the British demand for its product. Early in the present year Great Britain appointed a Controller of Timber Supplies and placed embargoes upon the importation of timber which put an end to the shipment of stock from eastern Canada, on private account. Everything which went across was on Government account and even this was comparatively small in quantity. It is rather a grim feature of the situation that Great Britain's ability to get along without Canadian stocks was largely the result of the manufacturers of Canada permitting their industry to be crippled in order that Canadian woodsmen might be sent to England and France to cut down home grown timber and convert it into such sizes and lengths as are required in France for the carrying on of the war. The Canadian lumberman has patriotically stood aside under these uncomfortable conditions, permitting himself to be crippled in his operations at home while his market abroad has been closed to him. This has been going on for some months, but lately there have been signs, that before long, the British Government would see its way clear to reducing the stringency of its embargo. The embargo upon shipments from Scandinavia was removed a short time ago and a cable received from Great Britain under date of July 21 states that Canadian shipments will now be permitted to enter England as deck cargoes, without licenses, and that the price restrictions of January 31 will not apply to stock imported from Canada after July 19.

Had it not been for this welcome piece of news it would not have been possible, in this issue of the Canada Uumberman, to refer to anything except a continuation of the difficulties surrounding the trade during the past year, especially during the first six and a half months of 1917. The news of the removal of the British embargo, however, gives a completely different appearance to the whole situation. It may not be wise to become too optimistic simply because of this change. There may still be trouble ahead for the timber exporters of eastern Canada, but undoubtedly the one thing for which everyone has prayed during the past five and a half months has taken place, and, great as its importance is, its significance may be even greater.

This issue of the Canada Lumberman is, to a considerable extent, different from any that have preceded it. Features are emphasized which have not been emphasized formerly. This is the result of the changed conditions under which the industry and trade are now being conducted. The most significant of these changes in eastern Canada is the awakening among retail lumbermen to the importance and the necessity of co-operation. A great movement has got under way among eastern retailers which promises to produce important results in the immediate future. This development, and others of significance are dwelt upon more fully elsewhere in this issue.

It is interesting here to recall the closing words of the introduction to the "Camp Supply" number of last year, which are borne out by the contents of this year's Annual Number, namely, that "Even this time-honored industry, in which methods have long ago reached a considerable degree of standardization, is continually developing new lines that result in important progress."

Progress of the Retail Association Movement in Ontario

The proposal to form an Ontario Retail Lumber Dealers' Association has passed safely through the preliminary stage and reached the goal of practical certainty. Those who have been promoting the idea have given it a great deal of study and have evolved a plan which gives fine promise of being successful from the first. The approval which this plan is finding in all quarters may be ascribed chiefly to the fact that the retail lumber situation in Ontario is ripe for just such a development, and to the further fact that the plan has been worked out so successfully elsewhere as to remove any doubt regarding its benefits and its feasibility.

Taking advantage of the lessons of the past and the examples of successful organizations of to-day, those who are responsible for the present plan have decided upon a number of important features that will commend themselves fully to the trade. The first matter that had to be settled was the arrangement of the association work and this presented quite a problem, but one which has been solved in a happy manner. The great size of the province of Ontario and the wide diversity of local interests which it includes rendered it doubtful whether anything in the nature of an Ontario Association of retail lumber dealers could be formed which would not suffer, and possibly fail, on account of these diversities. Such a large association, it was thought, might not be able to deal intelligently or quickly with local matters and for this reason might not hold the interest and loyalty of its members. A solution of this difficulty has been found in a division of the work, so that local interest may be maintained and local affairs given their full share of attention by those chiefly interested in them, namely the local dealers themselves, and so that the larger problems and work of co-operation, may be carried on by a central organization in which all the retailers of the province will have an interest. With this idea as a working basis it has been decided to form a small number of local associations, five in all, and an Ontario asociation with headquarters at Toronto. This plan, and the way in which it will be worked out, has been explained in the Canada Lumberman in previous issues. Its adoption has done more than anything else to secure the interest of the retail trade throughout the province and it will probably be found to present a good foundation for organizing co-operative efforts among the trade.

The aggressive retailers who have been responsible for developing this plan and working it out have already proved their fitness for work in this field. They have organized and put into operation one of the most complete local retail lumber dealers' associations in existence, the Southwestern Ontario Retail Lumber Dealers' Association. To them is due the credit for this movement, and the retailers of Ontario, in general, owe them much for their unselfish work.

Necessarily, in connection with such a movement, the originators are limited in what they can do. About all they can accomplish is to map out the work and call organization meetings. The greater part of the details can only be worked out after the organizations have been completed. In the present instance, however, much of this work has already been clearly indicated by associations which are in existence elsewhere and one of their most important ideas has been adopted in advance by the promoters of the Ontario organization. This feature is a retail lumbermen's training course, for which arrangements have been made with the Western Retail Lumbermen's Association. The intention is that this course shall be sent to members who join the Ontario Association before September 1. It has been necessary to fix a definite date for this purpose, so that the heavy mailing work involved may be systematized.

The above outline covers such progress as has been made up to date. The next thing to be done is to call meetings in the chief local districts, as soon as a sufficient number of members have joined the movement. These associations will elect officers and representatives to the Ontario Association and a meeting of this association will be held as soon as possible, in order to get its work under way.

In order to bring this organization into being, those who have been active in the movement are sending to Ontario retailers a full explanation and blank application forms for membership. These applications are to be signed and sent to The Canada Lumberman, 347 Adelaide Street West, Toronto. It is quite possible that some retailers will have been omitted in connection with the circular, on account of the difficulty in compiling a complete list. The intention has been to reach everyone, but if someone has been missed, a letter to the Canada Lumberman will immediately bring him full particulars, and enable him to join the movement from its inception.

The Minimum Carload Situation

The appearance of a number of lumbermen recently before the Board of Railway Commissioners for Canada at Ottawa, when a hearing was given to their representations against the increased minimum freight rates upon lumber recently imposed by Canadian railway companies, did not achieve a definite result so far as any declaration by the Board is concerned, but it is believed that the representatives who had charge of the lumbermen's case made a strong enough impression on the Board to persuade them of the necessity of going into the matter very fully before granting to the railway companies the right to make their increased charges permanent. Lumber shipers have no desire whatever to escape or to shirk their share of the burdens placed upon them today. Their patriotic course in connection with all matters relating to the war has been clearly enough demonstrated to need no argument and it is not possible to imagine that, in opposing increased minimum charges, they are seeking anything to which they do not believe they are entitled. In fact, it is difficult to see how, even the railway companies themselves can claim that the increases are in any way justifiable.

Taking the matter upon its simplest basis, that of the physical impossibility of including in a freight car, in many cases, the weight which the new regulations say shall be considered a minimum, the lumbermen's case is clear. On account of the peculiar nature of lumber it is physically impossible to put into a 36 ft. car, for instance, any quantity of lumber of such a size as 16 ft. which will fill the car's cubical contents. The wide variety of sizes produced and required by the trade present an almost equally wide series of difficulties for the shipper who wants to put into a car the greatest quantity of lumber that it will contain.

Under these conditions the minimum weight—which is presumably calculated upon the cubical contents—cannot be loaded in a great many cases, and it follows that the lumberman who makes such a shipment has to pay to the railway company an excess amount of freight charge for which the railway performs no service. In a nutshell, this is the whole situation, and all that the railway companies were able to say in upholding their case was of a theoretical nature, based upon the scarcity of cars and

No one will contradict the railway companies in connection with their claim that freight cars must be loaded as full as possible under present conditions. Unfortunately these conditions seem likely to last indefinitely, but lumbermen today are doing everything possible to load their cars with all they will hold, and to do their loading and unloading promptly so that cars may not be kept idle longer than is necessary. Wholesale lumbermen, for instance, are sending to the mills, in all their letters, a notice to the effect that cars must be loaded to capacity, and wherever it is possible for the mills to do so they are even going out of their way to comply with this requirement.

Under these conditions there was really only one logical thing for the Board of Railway Commissioners to do, when they found a strong conflict of opinion between the railway companies and the lumber shippers, and that was to make enquiries for themselves upon the spot. A suggestion to this effect was made to the Board by Mr. A. E. Eckardt, representing the Lumbermen's Section of the Toronto Board of

Trade, and the impression given by the Board, by the manner in which it received this suggestion was that it would act upon it. Lumbermen will be ready to abide by any regulation which the Board may make after it has studied the situation at first hand in this way. Its representatives, when they visit a number of important lumber shipping points, will see that the cars are being filled to capacity and that the weights shown are frequently below the minimum now required. A report by the Board's officers after making such an investigation, cannot do anything but uphold the facts as they have been pointed out by the lumbermen, and the members of the Board will then be able to approach the matter with a far more definite understanding of its details. What the lumbermen are seeking is simply that a set of minimum weights shall be established under which they will not be called upon to pay for services that are not rendered. Under the old minimum weights, there was little or no complaining. Occasionally it was not possible to fill a car so that it would contain the full weight required, but on the whole the situation was a fair one and a return to it will do no one an injustice.

Standardizing Aircraft Timber Specifications

A conference on aircraft spruce specifications was held at Washington, D.C., recently. Those taking part included spokesmen for the Pacific Coast and Carolina spruce interests and representatives of the aviation section of the signal corps, the aircraft production board, the British, French and Italian missions now in this country, the lumber committee and various American airplane manufacturers.

Among the purposes of the conference were to make the spruce manufactures thoroughly familiar with the quantity and character of the requirements which the nations fighting Germany will need during the coming year; to arrange for standard specifications for sawing the spruce for all four of the nations represented; eliminating the waste and confusion which now arise from improper sawing; and to discuss arrangements for a proper coordination of purchasing to prevent competitive bidding for the lumber which all countries need alike.

It was pointed out that the average airplane needs less than 200 feet of spruce for its construction, while a thousand feet have to be allowed for the job under present conditions. It is hoped that through this personal conference between men familiar with the needs of the airplane factories and the spruce manufacturers a satisfactory common agreement on sets of standard specifications for the mechines now in use can be worked out through which the lumber as it comes from the mills will more nearly approximate the form required for the finished product.

The recommendations of both the foreign and American experts were presented to the conference and the co-operation of the manufacturers will be sought in putting them into effect. Particular emphasis was laid on the importance of cutting down the amount of raw material needed for each airplane because of the necessity of economy in shipping space for that sent abroad.

It is now accepted as settled that there will not be real difficulty about drying green spruce by the kiln process. Twenty experts have been at work at the Madison (Wis.) laboratory for weeks, some of them for two months and more, conducting experiments along this line, and also making tests of wood for propellers for airplanes. The net result of the tests is the conviction that spruce dried in kilns under a process requiring three weeks is superior to airdried spruce for the manufacture of airplanes.

These experiments have eliminated the fear that the United States and the Allies might find themselves short of spruce dried in the air and be unable to carry forward the big airplane program.

The possibility of using eastern and southern spruce for Pacific coast spruce has not been overlooked. The accessibility of spruce on the west Coast and the large size of the timbers naturally make it the preferred material. Spruce in the east and south is much smaller, although some of it is of excellent quality. For the most part, the small parts of airplanes which could be manufactured from lumber cut from small trees can be tuned out of the material left over after the big west Coast spruce tree has been run through the mill for the larger stuff. It is not believed, therefore, that eastern and southern spruce will be largely utilized in pushing forward the aviation program.

It is estimated that the United States and the Allies together will require about 75,000,000 feet of spruce during the next twelve months. The Allies last year imported 26,000,000 feet of Pacific Coast spruce and this year they are taking more than 32,000,000 feet. Howard E. Coffin and other members of the aircraft board hope that a considerable saving may be made on the aggregate quantity of lumber used. This is believed to be doubly important because of the necessity for mobilizing the industry in order to insure a supply of material.

Editorial Short Lengths

Official announcement of the safe arrival in England of the ten portable sawmill units contributed for war service by New England lumbermen has been made at Ottawa by the Canadian Government through the chief press censor's office. The American lumbering battalion sailed from a port of eastern Canada in the latter part of June. They left Boston on June 15 and were given a most enthusiastic send-off by their friends, leading lumbermen who aided in raising the units and by many prominent citizens and public men. With the woodsmen on the British transports when they sailed from a Canadian port were 4,700 Canadian troops, including a Canadian forestry draft.

According to dispatches received from London, the complete equipment of the sawmill units caused much surprise in England and occasioned a great deal of favorable comment. The woodsmen had with them not only the necessary machinery, but were fully equipped in every way, even to lubricating oils. Their arrival found them ready to establish their sawmills in British woodlands and to begin work at once.

In no individual instance has the helpful activity of the United States been better illustrated than in this extension of assistance to the British Government in the solution of the serious problems involved in providing the timber supply for the British forces in France. The response to the English need was given with a swiftness and efficiency characteristic of the American forester and lumberman. No time was wasted and there was no lost motion in achieving tangible results. The whole proposition was worked out within twenty-four hours of the receipt of news that England would welcome such assistance, and the machinery was working smoothly to make the contribution immediately effective.

President A. H. Smith, of the Michigan Central Railway, has issued a circular to officers and agents, containing suggestions made by the advisory railway committee, working under the direction of the Council of National Defence, in order to secure greater efforts towards efficiency. The suggestions are that both company freight and commercial freight be loaded and unloaded more promptly, and that cars be loaded heavier as a war measure. With regard to the first suggestion, it is pointed out that there are from 250,000 to 300,000 points in the United States and Canada where freight is received and delivered, and a slight improvement at each would make an astounding aggregate. Prompt handling of cars by shippers and receivers is also urged.

Mill Employees in B.C. on Strike

Serious Labor Disturbance, Started in Washington, Closes Down Many B.C. Plants

The strike of employees in shingle and lumber mills in the State of Washington has reached British Columbia mills, and the effect has already been serious. An eastern Canada wholesaler has received from a shingle manufacturer in British Columbia a letter outlining the situation in the following words:—

"As you have probably learned, the employees connected with the shingle mills in the State of Washington declared a strike to become effective on July 16. On that day a number of the crews in the various mills throughout the State commenced to walk out and between 90 and 95 per cent. of the shingle mills were closed down. This also spread to the sawmills and to the logging camps, so that the majority of the men employed in these branches of the lumber industry have walked out.

"On July 15th the white men connected with the shingle industry in British Columbia had a mass meeting at New Westminster which was addressed by a leader of the Union in the State of Washington, and they decided to go out on strike on July 23rd. When July 23rd came along only three or four of the shingle mills in British Columbia were unable to operate, but before noon of the day enough men had walked out to close down between one-half and two-thirds of the mills and by the middle, or the end of the week, we are certain that all mills will be down. One of our mills did not start on July 23. One ceased operationg at noon of that day. The other closed down at the end of the day, so we are closed down tight.

"How long this strike is going to last no one is in a position to say, but we have talked with a number of lumbermen from the State of Washington and they feel that it is certain to last from a month to two months. We hope that they are wrong, but that remains to be seen. What the men ask for is eight hours work instead of ten hours; but ten hours pay for eight hours work, and this means a straight increase of 20 per cent., which is more than the mills can stand. Moreover, if the mills operated under such terms their output would also be reduced by 20 per cent. Therefore, in view of the above and the entire situation, all business has ceased with us, all prices are cancelled and we cannot accept any orders."

Mr. J. J. Donovan, vice-president of the Bloedel Donovan Lumber Mills, referring to the situation, says:—"Local millmen have resolved unanimously to resist the eight-hour day even to the point of closing every plant operated by the 100 or more concerns that have organized to meet the employees' impractical demands. . . . . I feel certain that the German Government is paying some of the agitators for their activities. Employees are drawing higher wages—wages that net them more money after paying for their necessities even at the increased prices—than at any other time in history. They have no real grievance against the millmen. Our company has voluntarily raised wages three times during the year and have granted bonuses to those who remain with us. We met a payroll of $118,000 last month and would regret exceedingly to be compelled to close our plants, but we can not shorten hours and raise wages any further and operate. . . .

"This is not merely a labor trouble. It is a conspiracy against the government in the guise of labor's demands. It is directed largely at the concerns that are engaged in supplying the metals required for the army, the foodstuffs which must be produced in unusual quantities to further the allied cause and the lumber for the ships, cantonments and other necessary government works. We believe the Federal authorities will have to take the question in hand very soon, but whether or not it does the leading lumbermen and shingle manufacturers will not be coerced at this time by I. W. W.'s or by paid agents of the German propaganda in the United States. That is certain. If it is to be a strike it will be futile. If a walkout, it will be more serious for the community than the public can now realize, for it will virtually paralyze the business of the State. We have met the labor situation with high wages, as high as can be paid. We can not operate an eight-hour day. That is decided and it is final."

Bulletin Concerning Ash

The United States Forest Service has published bulletin 523 by W. D. Sterrett, "Utilization of Ash." It is a pamphlet of fifty pages, filled with information relating to the supply and utilization of this valuable wood. Particular attention is given to various uses, and the list of such uses includes over 300 articles made of ash. The bulletin contains much historical and statistical information which should prove valuable to the manufacturer and users of ash.

British Embargo Restrictions Reduced

A cable despatch from London, England, under date of July 21, states that the British Board of Trade has announced that the restrictions on the importation of timber from Canada have been relaxed, allowing timber imports from Canada as deck cargoes, without licenses. The price restrictions of January 31 have also been removed, and are not to apply to timber imported from Canada after July 19. Canadian exporters have already received enquiries from English firms, indicating that there will immediately be a good demand for any stock that can be shipped. The only information at present available is that contained in the cable, but it is presumed that a fairly extensive quantity of timber will go forward in deck cargoes, and that the Admiralty will, to a considerable extent, control the selection of stock for export. Present space rates are about 350s. per standard.

In the House of Commons on July 18, Sir John Flemming asked the president of the Board of Trade to relax the regulations prohibiting the import of Canadian timber and to allocate space in requisitioned vessels. He also asked that importers of Canadian timber be granted liberty to increase January prices. Mr. Roberts, in reply, said that the controller of timber had been trying to reduce the restrictions on Canadian timber, but tonnage difficulties had delayed the matter. Import licenses are now obtainable for shipment in neutral vessels from Canada, but such are not possible for steamers. He hoped to arrange the increase in January prices shortly.

New England Railroads Revise Embargoes on Lumber

Embargoes against lumber shipments on New England railroads and connecting lines from the south and west have been revised within the last few days, but the movement of lumber is still considerably restricted. Lumber for export at any eastern port will be accepted only upon receipt of satisfactory evidence that the necessary vessel space has been contracted for and that the car will be unloaded promptly upon arrival at the destination. Northern and eastern lumber loaded to full carrying capacity of the car is being moved over the Boston & Maine Railroad to local points, but the company is cautious about granting permits for shipments to southern New England and New York points by way of the New York, New Haven and Hartford and Boston & Albany railroads, or their connections, unless strongly assured that the car will be unloaded and released promptly.

Lumber is being accepted by the New York, New Haven & Hartford Railroad at its Harlem River and Maybrook Junction, N. Y., gateways only for a limited number of designated New England and New York points and only when the car is loaded to full marked or practical loading capacity. Similar restrictions are placed by this road upon lumber shipments coming from the New York Central Railroad.

Rail transportation east of the Hudson River and north of New York City is largely controlled by action of the New York, New Haven & Hartford Railroad and this road is still having much trouble resulting from the heavy volume of freight offered and lack of sufficient cars.

Enormous Increase in Prices of Pulp and Paper

Few commodities of commerce are recording such remarkable advances in price in Great Britain as pulpwood and paper.

The following statistics, covering the first five months of the present year and the corresponding period of 1915, illustrate the advance in prices:—

	1915 Quantity	Five months. Value
Total imports of chemical wood-pulp . . .	89,332 ton.	$4,000,000
	1917 Quantity	Five months. Value
Total imports of chemical wood-pulp . . .	63,690 ton.	$12,115,000
	1915 Quantity	Five months. Value
Total imports of paper (including boxes and cartons of paper and cardboard)	4,234,945 cwt.	$11,500,000
	1917 Quantity	Five months. Value
Total imports of paper (including boxes and cartons of paper and cardboard)	1,264,638 cwt.	$7,900,000

Government Likely to Take Over Railroads

The latest despatches from Ottawa indicate that the Government is likely to take over the control of the Canadian Northern and Grand Trunk Railways, at least during the war. A government caucus recently discussed the matter, but gave out no report. A. W. Smithers, chairman of the Board of Directors of the Grand Trunk Railway, had a long interview with the Prime Minister on July 26th, and Sir Wm. MacKenzie and Z. A. Lash, of the Canadian Northern were also in Ottawa on business, presumed to have connection with this matter.

Quebec's Exports Increased

Advance of Nearly 45 per cent. in Value—Wood and Its Manufactures the Chief Products—Details of Trade

The trend of exports to the United States from the Quebec Consular District continued upward in 1916. Values of all articles shipped totalled $16,264,382, as against $11,233,409 in 1915, an increase of nearly 45 per cent. as compared with a gain of 10 per cent. in the preceding twelve months.

With the exception of $2,074,136, all articles exported in 1916 were wood and manufactures of wood, and these attained the splendid aggregate of $14,190,246 as compared with $9,615,336 in 1915, a gain of more than 47 per cent. The accompanying table sets forth in detail comparisons of the several articles for 1915 and 1916.

An examination of this table shows the most notable individual advance to be in news print paper, which added 41,888,663 pounds in quantity of material and $1,100,718 in value of its former record. New high levels were also set for all classes of wood pulp and, collectively, they represent an augmentation of 83,624,522 pounds in quantity and $2,314,679 in value. The movement of the sulphite unbleached variety was nothing short of spectacular; the gain here was 28,869,067 pounds or 887 per cent.

Gains of greater or less importance are revealed in every item of the table except wrapping paper. This declined from 9,365,083 pounds in 1915 to 2,015,733 pounds in 1916, but in the face of such favorable results elsewhere the setback makes no impression on general results. Then, too, the more important sales of woodpulp and pulpwood were doubtless influenced favorably by obstacles that depressed the manufactured product, for it is probable that the poor showing for wrapping paper is due to increased price and consequent higher customs duty in the United States.

Lumber, including laths, shingles, ties and posts, was exported to a value of $1,821,064 which is 50 per cent. more than the same articles netted in 1915. The rough product represents $1,482,375 of the total money value and was responsible for 80 per cent. of the increase in this division.

Study of the figures herein impresses one with the immense value of forests to the province of Quebec. Through active methods of harvest and manufacture they have become powerful magnets to draw wealth into local coffers from foreign pockets. Certainly much of the prosperity of the province in normal times will depend upon the ability of local shippers to continue shipping their wood and manufactures of wood to the markets of the world in competition with other producing countries.

Table of Exports to the United States

Articles	Unit of Quantity	1915 Quantities	1915 Values	1916 Quantities	1916 Values
Paper and mnfrs. of:

Total of all exports			$11,233,409		$16,264,382

Minimum Weight Case Before Railway Board

The increase in minimum car load weights imposed by Canadian railways were considered by the Board of Railway Commissioners for Canada at a hearing in Ottawa on July 17th. In addition to the representatives of the railways, there were present a number of lumbermen, including Mr. A. E. Eckardt, representing the Lumbermen's Section of the Toronto Board of Trade; Mr. Arthur H. Campbell, representing the Montreal lumbermen; Mr. Frank Hawkins, Secretary of the Canadian Lumbermen's Association, and Mr. T. Marshall, of the Toronto Board of Trade. The objections to the increased minima were explained in detail by the lumbermen. Briefly, these objections are covered by a resolution which had been passed at a previous meeting of the Lumbermen's Section of the Toronto Board of Trade, which was as follows:—

Whereas, the increased minimum carload weights for lumber are such that in many cases a car loaded to capacity will weigh much less than the minimum, thus permitting the railways to collect a large amount of money for which they have rendered no service, and

Whereas, frequently the railways are unable to furnish the class of car desired, but send instead a car or cars that are of a larger class than is necessary, thus imposing an additionally high minimum weight charge upon the shipper and,

Whereas, the charge should be only for the actual weight when a car is loaded to its full practicable capacity and,

Whereas, owing to the fact that lumber is sawn into certain standard lengths and that no practical combination of lengths will allow of a car being loaded to its actual cubic capacity, thus making it manifestly unjust to demand that the weight of a carload of lumber shall correspond to the marked cubic capacity and,

Whereas, under the abnormal conditions of to-day's market green lumber is being shipped, and a return to normal conditions of dry lumber will seriously aggravate the injustice,

Therefore, be it resolved that the Lumbermen's Section of the Toronto Board of Trade urge upon the Board of Railway Commissioners for Canada the unfairness of the increases, and request that the Board order the railway companies to return to the charges formerly in use.

The railroad companies confined themselves to a discussion of the subject largely from a theoretical point of view, not being able to combat the definite and actual cases, many of which were presented by the lumbermen, showing the impossibility of loading cars to the minimum capacities, now required. The lumbermen admitted readily, the necessity for loading cars to their full visible capacity, but presented a large number of instances in which, on account of the different lengths of lumber loaded, it was not in any way possible to fill the cars to the minimum weight required.

The representatives of the railroads and the lumbermen were not able to agree in regard to the situation. Many tentative suggestions were presented by the Board, but were not of a kind to meet with approval by both sides.

Finally, Mr. A. E. Eckardt, for the lumbermen, suggested that the Board should send out representatives to a number of lumber shipping points and have them actually inspect and report upon the results of shipments taking place. Mr. Eckardt said that with this information before them, the Board would be in a position to issue an order regarding minimum weights, and that the lumbermen would be prepared to accept such an order.

While the Board did not give an undertaking to adopt this course, it appealed to them strongly, and at the conclusion of the hearing, the Board decided to postpone the consideration of the subject for the time being; the belief of those present being that Mr. Eckardt's proposal will be carried out.

The lumbermen were fairly well pleased with the outcome of the hearing, feeling that the Board recognized their case as practical and unanswerable, and believing that the result will be a reduction in the minimum weights now in force.

St. John Shipbuilders Busy

R. E. Armstrong, Secretary of the St. John, N.B., Board of Trade, in a letter to the press says:—The semi-centennial of Confederation finds St. John engaged in the construction of a fleet of wooden steamers to relieve the necessities of the Motherland. Grant & Horne have contracted with the Imperial Munitions Board to build two steamers of a cargo carrying capacity of 3,000 tons. These will be constructed in a shipyard that was famous in the days of wooden ships for the magnificent vessels it turned out, but which has been silent like all the other shipyards in this locality for thirty years or more.

Two other firms are arranging to build wooden ships immediately, with the expectation of later on becoming steel ship plants. These are the St. John Shipbuilding Company, and D. A. Saker, an English builder. The latter has bought the Warner Mill property fronting on the main harbor for that purpose. He will put down three ships at once.

St. John was the home of wooden ships from 1770 to 1884. In 1876, the year preceding the great fire, this port stood fourth in the list of great shipping ports of the world, having 805 ships on the register, aggregating 280,073 tons, the revival of wooden shipbuilding, after all the old builders had passed away and all the old shipyards had been dismantled, marks an epoch of great importance in the history of the city.

Ontario Retail Lumbermen Organizing

Good Progress Made in Working Out Arrangements for Local and Central Associations—Details of the Plan and of the Local Divisions

It ain't the guns or armament,
Nor funds that they can pay,
But the CLOSE CO-OPERATION
That MAKES them win the day.

It ain't the individuals,
Nor the army as a whole,
But the everlastin' TEAM WORK
Of EVERY bloomin' soul.

Rudyard Kipling.

THE committee of the South Western Ontario Retail Lumber Dealers' Association, which was appointed recently to promote the formation of other local associations of retail lumber dealers throughout the rest of the province of Ontario, together with a central association having headquarters at Toronto, has been allowing no grass to grow beneath its feet. A great deal of study has been given to the situation during the past two or three months, and the scheme of operation has now been crystalized fairly definitely.

The executive of the South Western Ontario Association held a meeting at Chatham on July 16th, and formally endorsed a proposition to affiliate with the Ontario Association. When the work of organization has been completed in connection with the Ontario Association, the members of the South Western Association will be asked by their executive to pay whatever fees are decided upon. The executive has also appointed a committee consisting of the president, Mr. Chas. Hubbell; the secretary, Mr. B. F. Clarke, and Mr. J. C. Scofield, to attend the joint meeting of representatives of all associations for the formation of the Ontario association, when the meeting is called. Thus the South Western Association has placed itself in full accord with the proposals that have already been worked out, and has taken the necessary steps to do its share in the general organization work.

The South Western Association has been one of the chief moving forces in connection with this proposal and it is due to their enthusiastic support that the plan has made such promising headway. They may quite properly be considered the parent organization of the whole scheme, having formed their own association several years ago, carried on their local work successfully, and, in an unselfish spirit, devoted much of their time and thought to the spread of the movement, so that other retailers throughout Ontario may benefit by the advantages of co-operation.

Subdivision Into Local Associations

While the proposal and its objects have been outlined in the Canada Lumberman in previous issues, the progress that has been made during the past few weeks justifies a further reference to the subject and an explanation of some of its details. The accompanying map of Ontario shows how it is intended to subdivide the province into sections, each of which will have its local association. These subdivisions have been worked out by those who are interesting themselves in the plan, but, of course, are not to be considered as final. Various local considerations may be found to make some changes necessary, but in a general way it is probable that this division of the province into five sections is fairly close to the most satisfactory arrangement that can be made. The present South Western Association will be known as the Southern Association, and will cover the province from Windsor to London, between Lake Erie and the north boundary of the County of Huron. The Western Association will take in from Ingersoll to Burlington, and from Georgian Bay to Lake Erie. The Central Association will cover from Oakville to Belleville and from Lake Ontario northward, to include Simcoe County and Haliburton County. The Eastern Association will cover the rest of Ontario eastward from Napanee and northward to Pembroke. The Northern Section will be that portion of Ontario north and west of the other sections. The present proposal is to have the headquarters of the local associations at Windsor, Hamilton, Toronto, Ottawa and Sudbury.

Retail Lumber Training Course

Special arrangements have recently been made with the Western Retail Lumber Dealers' Association which will enable the new organization to start its usefulness on an extended scale, immediately the plan has been put into operation. A "Retail Lumber Training Course" which is of much practical value to retailers will be a feature

Proposed division of Ontario into five sections for Retail Lumbermen's Associations.

of the association service. Each member who joins the Ontario Association now will receive this complete service. This course has been enthusiastically subscribed for by the members of the Retail Lumbermen's Association of New York and other states. It is a unique publication, prepared by practical retail lumbermen, using the services of experts in each line.

It has not yet been possible to arrive at any certain estimate of the expenses of an organization of this nature, but it is believed that for preliminary purposes a membership fee of $15 each will be found sufficient. It is proposed, therefore, at present, that each member joining the Ontario Retail Lumbermen's Association shall pay $15 for the first year's fees, this to include the "Retail Lumber Training Course," which is in fourteen instalments. September 1 is the date upon which it is hoped to have the organization in a sufficiently advanced stage to warrant sending out the first instalment of the course, and all members whose dues are paid prior to that date will be entitled to receive it.

Meeting To Be Called Soon

A circular letter and full details of the plan are being sent to Ontario retailers, and from the replies already received it appears that the whole proposal is meeting with general approval. As soon as a reasonable number of applications have been received it is intended to call a meeting in each district for the election of officers and committees.

It will be seen from this summary of the work already done that the plan is now well advanced and that in a few weeks the movement promises to be in actual operation. The enthusiasm of all who have been approached is so remarkable that success seems to be assured.

Under the plan that has been worked out the local associations will be able to attend to such matters of mutual interest to their members as are of a local nature, and the Ontario Association will look after the larger matters that are of mutual interest to members in different associations. These larger questions are of a wide scope, including legislation, advertising, plan book service, lumber training course, insurance, unethical shipments, standardizing of cost accounting, etc. There is, in fact, a very extensive field of activity both for the Ontario Association and for the local associations, and it is expected that in a short time the association will have become thoroughly representative of the extensive retail trade of the province. It will be of the greatest importance, however, that the retail lumber trade should take this movement up with enthusiasm. The formation of associations is not a matter simply of holding a few meetings and electing officers. Success depends upon the extent to which the members interest themselves in the work. A body of officers, however capable and energetic they may be, can be of little use to an association unless they are backed up by an active membership, who devote as much of their time and thought as possible to furthering its objects.

The opinions of a number of readers of the Canada Lumberman upon this subject have already been published in previous issues, showing that there is general approval of the proposed plan. A few more letters received recently from retailers in Ontario enforce the approval of the others. Extracts from some of these letters are as follows:—

Matters That Need Association Attention

Editor, Canada Lumberman:— Hamilton, Ont.

The present condition of the lumber market emphasizes the need of co-operation amongst retailers, and shows up many weak points in our present methods of doing business. The price of lumber is being advanced beyond all precedent and without a word of warning from the producers, and retailers with contracts on hand are awakening to the fact that what were apparently good safe propositions are now very undesirable.

A provincial association of retailers could remedy these conditions to a large extent, and have some say in the cost of the material they buy. As it is at present they have no say either in the matter of price or grading. The sawmill man makes the grade to suit his ideas and the class of log he manufactures. It is the same with regard to trimming. If he thinks there is something to be saved by producing odd lengths then the odd lengths are made, and the retailer will either be compelled to go to the extra expense of separating them, or make up his mind to make a present of the odd foot to his customer. Another matter that concerted action on the part of the retailer would bring about is the standardizing of thicknesses and the adoption of a universal tongue and groove for all milled stock, so that the product of two different planing mills will fit together and it will not be necessary, as at present, to keep them separate.

With regard to the matter of prices, we do not know of any commodity that requires more careful and intelligent consideration. So many factors enter into this department of the business that there is a great opportunity for a wide difference of opinion, and a general discussion of these different factors will do more to educate the trade than any other method.

Then again, we have our troubles with transportation, the intricacies of the lien law, the extension of credits to contractors, and the matter of trade discounts.

These and a dozen others are matters which would be ever so much improved by a careful consideration by good representatives from the retail trade.—Thos. Patterson.

Greatly Needed by the Trade

Editor, Canada Lumberman:— Brantford, Ont.

If there is any business in Ontario that needs an association such as suggested in the Canada Lumberman under date of July 1, 1917, it is the retail lumber business of Ontario. We think it the right plan to have a central association which naturally should be located at Toronto, and the province divided up into districts to suit the dealers. We have every confidence that once this association is organized, any dealer who cannot see his way to go in on the start, will be only too anxious to get in the organization after he sees the benefits derived from it.

We trust that you will favor us with advice of any further movements in this matter, as we wish to help it all we can.—Mickle, Dyment & Son.

A Great Benefit to the Industry

Editor Canada Lumberman:— Sarnia, Ont.

We are strongly in favor of "collective thinking" on the part of the lumbermen of Ontario. The lumber business has been conducted in too much of a haphazard happy-go-lucky way, and it is just in the past few years that the lumberman has realized that it was necessary to specialize and study his business as carefully as the manufacturer, wholesaler or retailer of any other commodity. Following this along a little further, it leads to the necessity of frequent meetings of the lumbermen in order to obtain the benefit of one another's views on the situation, and strong organizations in charge of broad fair-minded men would be a great benefit to the industry in general.—R. Laidlaw Lumber Company, Chester H. Belton.

Could Handle Insurance of Members

Editor Canada Lumberman:— Thamesville, Ont.

I have delayed somewhat in answering your letter because I have had the idea of fire insurance in connection with our association. I mentioned this at a meeting nearly four years ago, but some of our members thought it was too large an undertaking. I have since learned that the Canners' Association carry their own insurance, and I have learned from a member of that association that it is very satisfactory. It costs them about 1½ per cent. for their insurance. Of course, planing mills would have to be struck at a higher rate. I strongly approve of the idea of a central association, in which each local association would be represented.—Charles Hubbell.

Heartily in Accord

Editor Canada Lumberman:— Comber, Ont.

I am heartily in accord with your views in regard to forming local retail lumber dealers' associations in every part of Ontario with a central organization where all the local associations would be represented. Such organizations would, in my opinion, be beneficial to the trade in general.—John Goatbe.

Would Draw the Trade Together

Editor Canada Lumberman:— Georgetown, Ont.

I think the proposal to form district retail lumber and building supply dealer associations a good one. The fact that this would draw together a body of men who have the same interests and difficulties to talk over and discuss would make the association of mutual advantage and well repay the dealer for the time spent in attending meetings of the association. I would join and take an active interest in getting other dealers to join. Wishing success to the plan—J. B. Mackenzie.

Will Co-operate Readily

Editor Canada Lumberman: Tweed, Ont.

We will be glad to co-operate in any reasonable way we can in the organization of an Ontario Retail Lumbermen's Association.—The Houston Co., Ltd.

E. A. Sterling Joins James D. Lacey & Company

The resignation of E. A. Sterling as manager of the Trade Extension Department of the National Lumber Manufacturers' Association, which was submitted to the directors at the meeting on June 20, in Washington, D.C., has been accepted by Acting President R. B. Goodman. This follows the return of Mr. R. S. Kellogg to Chicago, July 1, and his relieving Mr. Sterling of the duties of Acting Secretary which he had performed during Mr. Kellogg's absence in Washington as Secretary of the Lumber Committee. Mr. Sterling left Chicago on July 7, and with Mrs. Sterling drove east in his automobile to his home in Brooklyn, Susquehanna County, Pa., where he spent several weeks. Preliminary announcement is also made of Mr. Sterling's new connections, to the effect that he will be manager of the new Eastern office of James D. Lacey & Company. Offices have already been rented in the 42nd Street Building, New York City, and will be opened on or about August 1. In connection with his new work Mr. Sterling will also take up some of his former consulting practice as part of the activities of James D. Lacey & Company's new Eastern office.

Retail Lumber Associations—Their Field

What They Mean to The Members—Their Signifigance as Part of the Revolution in Modern Merchandising Methods

By W. D. Galvin, Hon. Pres. of the Western Retail Lumbermen's Association, Winnipeg

I HAVE been wondering what the "Retailers' Association" means to the average member. Does it stand for something coherent and definite? Does it represent ideas quite desirable and attainable because of their compatibility with the changing order of things? If this is not the idea of each individual member, then he must be reborn in his relation to association work and progress. The average dealer will admit that the association is a good thing. He joins, pays his dues, goes to the annual convention and hears a few suggestions which he agrees could be worked out to the benefit of his particular line of business. Two days later he is again working in his office, without the thought having occurred to him that he should be a live, integral factor in bringing to pass the very things that he knows in his own mind should be done. Another year rolls around, and the process is repeated. In association work there are too many Micawbers always "waiting for something to turn up," and, in this particular activity, always willing that the other fellow should perform the work of turning things up. I believe that this is a fair statement of what actually occurs within the membership of the average association. To many members, the convention is the association. Too often the average speakers and subjects talked of at these conventions may be likened to "dead ones carrying news from the grave." I believe that if it were possible to do away with the large convention, it would be a good thing—if for no other reason than to convince the membership of its insignificant contribution to association work. It must be admitted that the convention is necessary, at least for the completion of the organization, the general discussion of objects to be attained and its solidifying effect upon the membership; but, if larger things are not being done throughout the year, the mere "convention" is a meaningless thing. The average convention is bizarre, lacking, as a rule, in any definite purpose, and breathing an atmosphere of musty conservatism. It is little surprising, therefore, that association work is too often non-productive, since it has generally relied upon an annual convention to do something within a brief space of two days, and to regard that as the only work of the year.

The history of industry the world over—up to ten years ago—shows that the changes in processes have been slow. In fact, they were evolutionary in nature rather than revolutionary. We have, however, during the past decade, witnessed extreme changes in the manner of doing business, and we shall, in the next ten years, see a still greater transformation. So radical have been these changes, and so great will they become, due to public demand, legislation and diversity of individual requirement, that processes of operation in modern industrialism have been—and are being—revolutionized, the evolutionary spirit having become intolerable to a highly strung public nervous system. The old order of things in the retail lumber business fought persistently to regain its hold, but the shackles of worn-out methods are now in the process of being thrown off by the retail lumbermen themselves, and barely in the nick of time to save the business from passing into the hands of a new school of merchandising. This statement is made—not in the belief that such a danger is already passed—but with the object of pointing out some of the essential measures necessary to obviate such a result; and further, to emphasize the fact that we are at the dawn of a new era of merchandising, and that, if the retailing of lumber is to remain in the hands of those who have handled it, systematic organization and unification through the association is necessary. (The methods of the retail dealer must be constructive and progressive to hold his position, and he who denies that the change is in process will be swept off his bearings so completely as to be unable to get a safe footing in the new order of things, should he endeavor to hang to the fogyism of the past.

The Public Now on Top

The present administrators of the Western Retail Lumbermen's Association have endeavored to awaken within the membership a proper interpretation of the signs of the times, and have urged as essential factors, organization and co-operation on the part of all dealers, as a means of promoting better methods of doing business and thereby rendering better public service. The community rightfully demands adequate public service from any class of dealers, and more particularly from those who handle a commodity of universal necessity. In the days of P. T. Barnum, the public may have enjoyed the sensation of being fooled. In the days of Jay Gould, it may have been possible in the handling of a large trust to say: "The public be damned." The sun has set on those days, however, and the public is now too wise either to be fooled or to be damned; and if the public is not measured out that to which it is entitled, agitation will soon result in establishing a new medium of service, and those who have failed will no longer be allowed to serve.

Space will not permit more than a brief summary of the things that might be said, and the things that each retailer should know, concerning the importance of accomplishing this programme of organization and co-operation, but I believe that this idea embraces the sum total of what must be done in order to maintain the business of the retail lumber industry within the hands in which it now rests.

During the first few months of 1915, a most encouraging indication that retail dealers were alive to the necessity of further organization was found in the fact that the membership of the Western Retail Lumbermen's Association increased very materially; but as there were still a large number of dealers who had not allied themselves with the association, it was evident that there were yet many who did not realize the value of being united. The old saying that "Competition is the life of trade" is insufficient and must include the broader statement that, through organization lies the development of industry, provided, of course, such organization be carried on within proper and prescribed limitations of the law.

Constructive Association Work

Before the end of 1915 the association undertook work of real and constructive value to its members. Of this work, mention must primarily be made of the architectural department, which was established as one of the features of the association. As a result of this department, a book was turned out offering plans which, for practicability, attractiveness of design and economy of construction, would hardly be equalled by any other plan book issued in the Canadian West. The management of the association issued a book which met with the requirements of the consuming public. This work has been actuated by the desire to render a public service which the retailers themselves have long neglected, namely: that of helping the customer to buy the finished product in the way of a house, barn or whatever he may desire rather than mere boards, shiplap, dimension, or flooring. I believe that such a work, on the part of the retailers, stands for efficiency in the business, and efficiency is, undoubtedly, the guide to all business success. This work was gotten out under the direction of a trained corps of architects, with the supervision of the secretary of the association, assisted by a committee having practical knowledge of western building requirements. This committee was composed of Mr. George Robertson and Mr. Charles E. Lee. Every retailer admitted his indebtedness to the untiring efforts of all those who contributed to the success of this work. This is one feature of a progressive campaign for better retailing which the Western association is promoting. It will be interesting, and no doubt add to its value, when it is known that the work in connection with the farm buildings was under the supervision of Mr. Robert Milne, of the Manitoba Agricultural College. A permanent association architectural department is now maintained by the association where the needs of the consumer in the country and small towns may be served at a nominal cost through the local dealer.

Activities of a varied nature, too numerous to dwell upon in any detail, are receiving careful attention from time to time, as the occasion requires. These include negotiations with the railroads respecting amendments and revision of rates, questions before the railway commission, and the inauguration of a lost and found debtors' department, the latter proving of especial value to the dealers. Other activities of the association have become well known to the dealers through the bulletin issued, all of which will become of ever-increasing value as the membership grows and as funds are thereby supplied for doing more extensive work.

Scrutinize Legislative Changes

Another feature of interest is the attention which has been directed toward obtaining laws which are fair and equitable to the business man. As an organization representing large investments, it is right that it should vigorously assert the opinion of its members, from time to time, upon existing laws and prospective laws before the legislature. If certain laws are good, why should we not voice the thoughts of fifteen hundred dealers who occupy positions of influence in the

various communities of the West in advocating such measures? If laws already in existence are bad; should we not be as active in getting them repealed? Timidity on the part of those affected often results in law-makers being dictators rather than servants of the public. The officers of the association can guarantee fair consideration upon the part of law-makers to any subjects which are of common interest to business men in general, providing individual dealers have sufficient interest to join the association, and by so doing, make their affiliation felt. A result of such activity by a united membership should, in itself, be enough to induce every dealer to help maintain an organization worth while. If any "doubting Thomas," casting his eyes over these lines, puts them down as empty statements, let him first write to the association, in order to be informed of what has already been done, before he allows his incredulity to pass this subject by as worthless. Let him reflect for a moment also upon the fact that in each province a legislative committee composed of competent men is being appointed, whose purpose and object is to devote careful study to the effect upon our business activity of existing laws, and to scrutinize prospective bills, which may be introduced from time to time, and which may have an important bearing upon our business activities. This idea should appeal to those genuinely concerned in seeing the interests of the retailer safeguarded and when the possibilities of what may be accomplished are known, "those who came to scoff will remain to pray."

It is obvious that in any general scheme of organization, co-operation of membership from within is essential. Any discussion of this point is needless, and in touching upon the subject of co-operation, I shall only refer to the desirability of this relation between the retailer and the wholesaler, or between the two distinct branches of the one industry. It is not within the province of this article to say what the manufacturers should do. The thought suggests itself, however, that much can be done by a strong "Retail Association" lending mutual support to the work of the wholesalers in a nation-wide effort toward educating the public to greater uses of lumber.

Lumber manufacturers have been too busy erecting capacity record mills and acquiring stumpage to give sufficient thought to better ways and means of marketing their product. The thought, apparently, has not taken deep hold that to ninety-five per cent. of the consuming public the property and uses of Douglas fir, for instance, as a finishing product, are things little thought about. If the men into whose hands this species of timber has passed have not seen fit to exploit the various uses to which it may be placed, little wonder that the world has taken scant notice of it. The same criticism applies to the neglect in advertising the merits of other woods. As is often pointed out, the lumber industry differs from others only in the fact that the article which it handles reaches the ultimate consumer in the form of raw material. While the promoters of wood substitutes are waging a consistent campaign through attractive advertising, the manufacturers and retailers of lumber have, up to the present time, done nothing to counteract the progress which they have made by any effort to acquaint the public with the superiority of wood.

Lumber in Need of Publicity

Permanent public exhibitions should be installed in rural centres, towns and cities, adequately displaying the uses of various woods, the superior points of construction and the susceptibility of these various woods to beautiful finish; altogether acquainting the public with infinitely greater uses of lumber than are now known to the average man. This would go far toward correcting many fallacies which have been forced upon the public respecting the use of wood substitutes. Such a scheme contemplates the co-operation of lumber associations, provincial governments and Dominion forestry departments, the effect of which would be far reaching—both upon the retailer and the wholesaler of lumber. From the fact that during the present period little building is being done, such a plan may appear untimely. However, that condition applies only temporarily, and such a scheme of co-operation at the present is most appropriate, the idea being that when the building propaganda is resumed, the public may be better educated to the general utility and attractiveness of lumber construction. Such an educational campaign has been too long delayed and as a consequence the manufacturer has lost markets which should be his, and the retailer—his logical customer.

While the retailer is offering designs for more practical and more attractive building, what is the manufacturer going to do to help the retailer educate the public to greater uses of lumber? Surely here is food for thought, and opportunity for profitable co-operation.

Co-operation in Its Widest Sense

Nor is this the only plan of co-operative intercourse for the good of the industry to which the retailers' and manufacturers' associations may properly turn their attention. When economic abuses arise, to what extent may government be asked to solve the problems? This is a much mooted question. The tendency of governments, during late years, has been to deal with business enterprises along harsh and critical lines, tending in some countries almost to persecution. The rights of business have often been minimized to satisfy popular whims. There has been allowed to grow up in Western Canada, largely because of the improvident exploitation of timber lands, and innumerable array of manufacturing plants, the capacity of which can more than supply, for generations to come, the average demand which this country may expect. Either inordinate waste is to be the outcome, or some government action tending toward aid, through tariffs and regulation of the output. Advocacy of government regulation is often frowned upon, and anything partaking of the nature of paternalism viewed with disapproval. But, should the heritage of many generations be disregarded by the present? Is it not time that governmental activity be directed to the aid of the industry? A government commission, free from the taint of politics, might wisely be employed to restrict annually the cut of the mills—commensurate with the prospective demands of the season, based upon probable export and internal requirements. A "protective" tariff might then advantageously be imposed to guarantee the internal markets to the products "Made in Canada" until the industry shall have acquired a substantial footing. Protection to home industries, in a new country, was long ago established as the seed of a nation's manufacturing progress. It is only when an industry has grown with the country to a point where it can "paddle its own canoe," that it can be said that protection is unjustifiable.

This suggestion is paternalism, you say. Well, possibly so. Would it not be better than demoralized industry and wanton disregard of the rights of posterity in handling the timber resources? Would it not be better that a reasonable amount of lumber be manufactured proportionate to the requirements, and that it be done at a fair profit? Is not the laborer worthy of his hire the same to-day as a century ago, and are not all men, both employer and employee, laborers? Such a proposition would enhance the value of lumber—not beyond a reasonable point. After all, should our resources be exploited and devastated to such an extent that, as present-day consumers, we may profit from all their benefits, at the expense of future generations?

This whole idea suggests itself as a part of a greater scheme of conservation, to which, I believe, the retailer should lend his co-operative support to that of the manufacturer. It should partake of an allied effort of the two branches for the good of the general industry and for public service, and nothing is of greater importance than scientific and applied conservation of a nation's resources.

The time is ripe for greater work, for greater effort. Our own industry, both retail and manufacturing, must be operated in keeping with the present progressive age. New measures often create apprehension only because of their unfamiliarity. But life is growth; to grow is to change, and to be vital—no organization, any more than an individual, can afford to cling to worn out theories, doctrines, or practices belonging entirely to the past.

The association will render valuable service to its members, in proportion to their progressive attitude and loyal support.

Purchasing Power of Corn

"Good morning, Si."

"Good morning, Hi."

"I say, Si, what is the price of that wagon over yonder?"

"Ninety dollars, Hi."

"Ninety dollars! Why, my father bought the same wagon thirty years ago for $60!"

"Yes, Si, he did, and he bought it of me, but as money was scarce at that time and I wanted some corn, your father delivered to me 300 bushels of corn in payment for the $60 wagon, and I can use more corn at this time, and I will make the same trade with you to-day as I did with your father some thirty years ago on the same wagon, and will give you from stock, in addition to this wagon

	$240.00

the present purchasing power of 300 bushels of corn."

Mr. S. J. Grogan, in charge of the lumber department of McLean, Kennedy & Company, Quebec, died on July 2 after a long illness. He was 31 years of age.

The Future of Retail Lumber Associations

Co-operation with One Another, with Consumers and with Manufacturers Developing Splendid Results for Benefit of the Trade

By C. A. Bowen, Sec. of the National Retail Lumber Dealers' Association

COLERIDGE has said, "Often do the spirits of great events stride on before the events, and in to-day already walks to-morrow. There is no doubt that the economic business conditions of North America are about to undergo a change of great significance, and for some time past the business men have seen the shadow of the event. But what is it to be? The question is arising in every brain and there is a constant effort being made to peer into the future, with a great desire to foretell the event correctly. As yet, however, we have not been able to discover just what it is, but we know that whatever it is, it will be the result of revolution and will be for improvement in all lines, from a co-operative standpoint.

For many years we have had associations of men in competitive lines in a small way, but to-day we see organizations on every hand and in every line of endeavor, whether it be of capital or labor, education or hygiene, politics or religion, and men in all walks of life and business are fast coming to the realization of the fact that they can only succeed and better their own condition in proportion to the help and assistance they give to their fellow men. They are commencing to realize that organized co-operation is the dynamic force which make big achievements possible, and that they of themselves alone are weak and impotent.

There is no one line of business which has needed the close co-operation and unity, more than the lumber business from the retail section, and the retail yard lumber dealers, all over the country are commencing to realize this and seriously consider it. The gradual change in this line which has been coming almost imperceptibly for some time and the consequent shifting of methods has had its effect. The old order of things has been gradually disappearing and new condititons are constantly confronting the retail yard lumber dealers. Unfortunately for them they have not been awake to this situation and there has been a lack of co-ordinated co-operation in the protection and development of their business, a condition super-induced, no doubt, by the fact that they were getting a fair volume of business, which came to them without much effort upon their part, and by the false idea that lumber had a fixed place and could not be supplanted, and also by a sort of self satisfied feeling of independence.

The Inevitable Result of Indifference

The result has been that many substitute materials have been put upon the market, the promoters and distributors of which knew that they had to go out and create a demand for their products and go after the business and not sit down and expect it to come to them. They have been aggressive advertisers and solicitors and have presented their arguments to the consumers and the general public in such a manner that the public thought themselves more progressive if they used the "new and up-to-date" material in place of lumber which they formerly used. What were the lumbermen doing to combat this influence and to stimulate the trade in their direction? Nothing!

And then there were the so-called "fireproof material" agitators, seeking by law to legislate lumber out of existence, or to reduce its use materially, through representations, many of which were false, that the use of their products rendered the consumer proof against fire, loss of life, etc., and aligning fire marshals and fire insurance men on their side, so as to present a feasible aspect to their arguments, in building code revisions. And what, until only four or five months ago, were the retail lumbermen doing to protect their interests and tell the public the truth? Nothing! In some communities, when certain interests took up the cudgel in defence of lumber, I am ashamed to say, the yard dealers did not accord a helping hand, or even offer to render any assistance.

Opportunities Neglected

In the matter of grading rules for the materials they handle, retail dealers who are most vitally affected, have had no organization even to assist manufacturers of lumber in establishing rules and classifications. In the matter of the "ready-cut" house, which has been encroaching on their business, and which is also such a menace to their possible customers and so costly in the long run, they have done but little to counteract its influence and have been slow to establish a service equally as good or better in their own yards to offset it.

In the matter of becoming better merchants and more thoroughly educated as to the merits and users of wood for all sorts of construction purposes, they have been very lax and negligent. Investigation has developed the fact that amazing ignorance has existed and still exists in many quarters as to the application and uses of wood. Species and sizes have been sold for uses for which they were entirely unfitted. The retail dealer has not only permitted to be manufactured but has encouraged it by handling and selling such species as "loblolly" and "old field pine" for joists and timbers, when he should have refused to handle such materials except for such purposes as they were fitted for, possibly crating, sheathing, or box lumber.

Lumber, to many retail dealers, has been just "lumber," and instead of assisting their customers to select lumber best suited for the purposes to which they intended putting it, they have not done so, and, either from a lack of knowledge, or on account of indifference, have merely sold what they were importuned to sell, regardless of what its use was to be.

In the matter of trying to stop the shipment of transit cars of lumber sent into their territory without orders, by jobbers, wholesalers or manufacturers who, if the retail dealer did not see fit on account of quality or inability or other legitimate reason, to purchase it, made every effort to force it on the market to the retailer's natural customer, and thus demoralize the market, put the retailer out of business, and generally injure the lumber business, the yard dealers have not been effective because they lacked proper organization.

In the matter of unethical shipments, legislative matters, cost accounting, and many other things of vital importance to their business, there has been a wonderful lack of organized effort and it is obviously necessary that in all departments, the retail lumber business should have the organization and influence and to prepare itself for the new conditions.

The Old Order Giving Place to the New

No one who is a student of economics can fail to appreciate the many and rapid changes which have occurred in the lumber business in the last few years or to agree that there are other changes coming of great importance. Are the retail yard dealers awake to the situation, and are they prepared to meet and adjust themselves quickly to it? What will the conditions be in another twelve months, and what will they be after the termination of the great world war, whenever that may be? It must appeal to the reasoning power of every lumber dealer, that from this time forth we must have business aims that are far reaching, that every thought as to what we do now must be planned to meet conditions that may appertain five, ten or twenty years from now; that we must not attempt to work alone, but must co-operate as never before with our fellow men, and particularly with those we consider our competitors, or who at least are in the same lines as we are; that while we are in business for a livelihood and to make a profit on our investment, we must not forget that we are trying to maintain a business for the future and that we owe something to posterity which will be of value and assistance to them in attaining greater heights than we may be able to attain.

We must acquire the organization idea, and understand that only through organized co-operation can we accomplish what we seek. We must learn that it is just as essential to our business and our future to be members of, and contribute liberally of money and time to, a central body organized for the best interests of, for the protection of, and for the advancement of our business now, as it is to have air, light, water and food to maintain life in our bodies and to be healthy.

We must realize that we cannot do ourselves any good nor give those dependent upon us any benefits by holding aloof from association and organization and being indifferent to improvements, and that individually we cannot, on our own responsibility, bring about any important reforms or improvements in our business. Only in unity is these strength.

The Case in a Nutshell

The National Retail Lumber Dealers' Association of the United States was formed some months ago, by retail lumbermen who realized the need for such a force and the demand for it in the face of present and future conditions. Its object is along the lines set forth in this article, viz.: to promote the general welfare of the retail lumber dealers of the United States; to co-operate with associations of lumber manufacturers and others in collecting and distributing information concerning the proper uses of wood and the general state of the lumber industry; to prevent as far as possible the sale of lumber of inferior

grade, kind, or manufacture; to correct business abuses in the lumber industry; to promote uniformity in the customs and usages of the men in the lumber business throughout the country; to stimulate lumbermen everywhere to the necessity of advertising lumber in an intelligent manner; to work with manufacturers in an effort to have all timber branded and trade marked, so as to assure, within a reasonable variation, the integrity of the grade and to make possible the identification of the stock; to protect the retail lumberman and his business in all ways where any adverse influence is being brought to bear and to be the parent body to the retail business in every way.

Recent developments, owing to war conditions, have shown clearly that the interests and efforts of every city, every village, every hamlet and every individual must be co-ordinated with those of the government, and parallel conditions in the lumber business are bringing about the same needs and justifying the existence of the National Association. One must not look lightly upon the important part this association is already playing and the much more important part it is destined to play in the retail lumber business and the very important position it must assume.

Co-operation is the product of sane and broad-minded men. The greatest success is obtained by men with the co-operative spirit, combined with energy and alertness; the men who will put their shoulders to the wheel with their fellow men in the interests of the cause which will help all. The value is not to be computed alone in dollars and cents, for association carries with it an uplift, a broadening of views and a stimulation to ambitious effort, and it instills a courageous spirit to brave difficulties and turn failure into success.

The lumbermen, in the retail section, have come to the awakening period. They are commencing to realize that they must co-operate to protect themselves and their business. They are commencing to realize that lumber can be surplanted by other and inferior materials and that it is necessary for them to advertise their materials to the consuming public the same as any other commodity, if they do not want the fickle minded public to forget the good qualities of lumber and chase after will-'o-the-wisps, in the nature of substitutes. We know that it costs to advertise, to influence public opinion, and to educate the customer. We know that force is not a factor in demand but that demand influences the price, but we must do our share, if we wish to compete and secure our portion of the business.

Retail lumbermen are commencing to realize that they need the influence of a strong organization to help combat outside influences and assist them in legislative work. They are commencing to realize that they need a central organization to keep them advised of fraudulent concerns in the lumber market and from which they can secure information concerning contractors and builders who move from one town to another, as to past record and history for credit purposes, and thus get protection.

They are commencing to see the necessity of becoming better merchants, having better sales forces, better cost accounting, better service and more up-to-date methods of all sorts.

The new era is dawning for the lumber business and if the retail lumber yard dealers all over the country will, as we believe they will, unite with their fellow dealers in the membership of the national or central associations, and do their share and their duty to themselves and the business, it will not only be the second largest industry in the world, as it is today, but it will be one of the most efficient, most fruitful and most highly respected businesses in existence.

Co-operation Makes Business Ideal

Separation Results in Discord and Failure to Realize Trade Possibilities—Association of Live Individuals the Goal of Organization

By Geo. Wilson Jones

JUST came in from seeing the 48th Canadian Highlanders united with the U. S. boys in a magnificent parade to stimulate recruiting. The newspapers can't find type big enough to fully emphasize the welcome given the Kilties and their visit to this country is doing an immense amount of good aside from the military value of their visit. Their visit brings to mind exactly the thought the Editor of the Canada Lumberman conveyed in his recent letter asking some ideas on association work.

Association is to be distinguished from organization. The former lays the emphasis on the individual, while the latter exalts the machine. The association needs organization, but if the spirit of association grows cold, no perfection of mechanism will produce the desired results. When the Highlanders march through our streets we feel that both Canadians and Yankees are bound together to accomplish one purpose and the feeling of unity is so strong that any minor points of difference at once become too ridiculous to enter into the question at all. That is precisely what happens when lumberman become associated. The lumber business is our life work and should be more than merely a mine where we get money to support us. There must be a pride in the business per se before we can bring it up to the point we aim at.

Every association worker keeps asking himself the question: "Is an association necessary?" This question keeps him thinking along a straight line. It prevents the work going off on a tangent and exhausting resources and energy in matters that do not pertain to the business as a whole. An association is necessary because no one dealer has a monopoly of ideas. Time was when it was considered suicidal to share your knowledge with your competitor. That was because the prime motive was making money and not giving service. We are progressing toward the time when a business man will have to give a reason for his existence and the business man who trains himself along the lines of service is the one who will survive. Your customer never buys mere lumber of you, but buys a floor, roof, addition, or complete building. Put in a still different light, the customer has an idea and comes to you to put that idea in tangible form. Get those two thoughts fixed:—You furnish service to your community and you sell ideas. Here is where the association principle comes in again. You get new ideas through association with your brother lumbermen and the only way you can meet them is through your association. Individual visiting is possible only in a slight degree. At a meeting, whether provincial or local, you meet a large number at the financial outlay of seeing one. This shows the economy of conventions. The term "convention" could well be discarded and the word "conference" used. There is the same difference between convention and conference as there is between organization and association.

Eradicating Erroneous Impressions

There are some old worn out notions that modern association workers are trying to eradicate. One of these is that the only honest reason men in the same line of business have for meeting is to fix prices. Practice has shown that prices cannot be fixed. There is always some one individual who thinks it is smart to cut, and as soon as this happens, away goes the combine. Another erroneous idea is that there is some innate antagonism between the retailer and the manufacturer. No one has ever attempted to give reasons why there should be, but certain men cannot conceive of activity that doesn't include a "scrap." Still another error is that all the association amounts to is a celebration once a year, and that there is no sense in paying dues to keep a secretary in idleness between conventions. As an actual fact, the conventions could be spared most easily of all activities, for the reason that they last at the most three days, while the spread of ideas from the headquarters goes on continuously. Now one more,—That there are so many calls on business men that they can't afford the additional expense, or, as some put it, there are already too many organizations. This error consists of the notion that dues are a contribution. Combat it with the thought that dues are payment for ideas that are just as essential as lumber itself.

The spirit of association can best be taught by local meetings. Take the dealers in a section whose problems are similar and who naturally come into competition, bring them into a local club, let them get acquainted. It is amazing to see how difficulties disappear. Such meetings are to the business man what the clinic is to the meeting of surgeons or the institute to the gathering of educators. The idea grows that competitors are not therefore enemies and a man gets big enough to rejoice when his fellow dealer lands a good bill. It brings out the fact that success means thoroughness. A man's natural pride stimulates him to be as good a manager as his neighbor. The territory covered by local clubs presents a better appearance than one where each man feels aloof from his neighbor. It also takes the sting out of competition. At a meeting a short time ago a committee was appointed to take a long trip and one man appointed asked to have his competitor also appointed to make the journey a pleasant one. That is what association does. Remember always that the basic principle of an association is to bring the dealers together so that they may be-

come better merchants. It follows inevitably that their customers get better service. When there is a better knowledge of merchandising, the manufacturer recognizes that the retailer is his head salesman, the man he looks to for the distribution of his goods. The association develops ability and reliability, these two beget confidence, and confidence just as surely begets orders. Orders mean profits, and profits mean success. There is nothing mystical about association work. The purpose is to make better merchants, and there is no short cut to this goal. Every activity must have this in view or it is wasted motion.

Association for Educational Purposes

There is a vast amount of education needed by every lumber dealer. He must learn that his customers know practically nothing about lumber and he should be able to advise them. The day has gone by when a man can sit in his office and wait for trade. He must learn that orders belong to him who hustles. He must not take the name "lumber yard" too literally. If his yard is "lumbered" with dirt, shabby piles, weeds, refuse, and all sorts of extraneous matter, he will not get the business. The modern store tries to have the entrance so alluring that a customer can't pass by. The store floor is on a level with the sidewalk. There is no chance of soiling or tearing the customer's garments as he enters. There is a smile awaiting him as attractive as the show window. How does this compare with the usual lumber yard? Such points as these are brought out and developed at meetings of dealers.

There is always the old bugaboo of the mail order house. It is a strange coincidence, perhaps, but the live dealers are not the ones who complain of this sort of competition. Being on the ground, knowing their trade, adopting modern methods, they are able to cope with any sort of outside competition. If half the energy wasted on calling mail order houses names were used to improve one's own methods, the mail order man would have pretty slim pickings. The mail order people know this, too. They don't put on their campaigns in towns where the newspapers are alive and well supported by the local merchants. The mail order ridden community is itself to blame and has invited the competition. One thousand inquiries sent out brought six hundred replies giving as the reason for the first mail order sent in, the discourtesy and lack of attention on the part of the local dealer.

There are two essentials to a good association. First, a group of "live wires" who will help organize local clubs, and who will give their thought to the organization. Second, a secretary who devotes all his time to the work and who can put into force the ideas of his "live wires." There is no use in wasting time if the secretary is to be handicapped by lack of funds and insufficient assistance. In years gone by, the secretary was some dealer who had so little to do he could take on the work and make some sort of a show of serving the members. If the idea is permitted to grow that the secretary is the association, there will be no support. If the true meaning of "member" is kept in mind, the association will grow stronger each year. The members ARE the association and the secretary is nothing more than their executive. Individual responsibility is what gives strength to the association and it cannot be developed when a member feels he is merely a customer of the secretary.

The association should develop as many special service departments as its funds will permit. There should be a traffic department, a legal department, an intelligence department, and an educational department. It doesn't matter how high the dues are if the members get adequate returns, and it is easier to finance an association doing something definite than one that exists merely as the embodiment of some mysterious force that will make a man when he joins more prosperous. The association is valuable in crystallizing the ideals of the trade and has an ethical influence that cannot be over estimated. As one very successful dealer recently put it: The lumber business is just what you make it; co-operate and the business is ideal, separate and it is hell.

Retailer's Interest in Wood Treatment

Preservation of Structural Timbers a Valuable Aid to Him in Giving Good Service, Building up Trade and Holding it

By Kurt C. Barth

The practice of wood preservation, or preservative treatment of structural wood with creosote oil, by the great mass of consumers—residents of the rural communities—is possible only if the available methods are economical and practical, i.e., conform to existing conditions.

An important function devolves upon the lumber dealer:

His interest in a sale commences with the delivery of the lumber. Thereafter the proper use of the product should be his greatest concern. If the purchaser fails to protect the sill, or whatever it may be, and it deteriorates quickly, it may be the consumer's loss, but eventually it is the "lumberman's funeral."

A "Substitute" for Every Purpose

There is a substitute product for every purpose for which wood is used, waiting and watching to capture the dissatisfied lumber consumer, who quite naturally is responsive to claims of superiority over wood because of his unintentional misuse of the lumber which he has purchased from some lumber dealer who "didn't care what happened to it after the sale," or who thought "the quicker wood rots the better."

Any product, no matter what it may be, is valuable to the consumer in proportion to the service it renders. The merchant retains and extends his patronage in proportion to the service he renders.

It is thus necessary for the lumber dealer to include wood preservation as one of the most important service features.

In order that the dealer may be able to advise his customers how to creosote lumber and protect it from decay he must familiarize himself with the fundamentals of the subject. He may acquire sufficient knowledge for his purpose with little trouble by careful perusal of the bulletins discussing wood preservation, which are issued by Government Departments, various agricultural colleges, lumber organizations, and manufacturers of refined creosote oil. The writer recommends more especially the bulletins mentioned below:

Farm Bulletin No. 744, issued by the U. S. Department of Agriculture, Washington, D.C.

Farm Bulletin No. 158, issued by the Iowa State College, Ames, Iowa.

Farm Bulletin No. 3, issued by the National Lumber Manufacturers' Association, Chicago, and Bulletins issued by the Barrett Co.

Upon careful consideration, numerous instances will occur where the preservative treatment of wood becomes of valuable assistance in the promotion of the use of lumber. Quite unconsciously selling talks present themselves which completely nullify the "permanence of substitutes" argument. Opportunities for advertising lumber in a new way are also offered, and its durability may be emphasized in connection with "rot proof" qualities when creosoted.

The development of this "service feature" is divided into the following stages:—

It is obviously necessary for the dealer—

First: To ascertain for what purposes the purchaser intends to employ the lumber he has bought, and determine whether the conditions under which it will be used are such as to permit the development of decay.

Second: To determine what method of treatment is most advisable under existing conditions, and what the approximate cost will be.

Third: To determine the increase in life which may be reasonably expected from creosoting, and the resultant saving to the consumer.

Fourth: The dealer must induce the customer to creosote such material as will be exposed to decay, and advise him in minute detail how that is to be done.

Fifth: The dealer should sell the customer a sufficient quantity of creosote oil at a reasonable price.

Sixth: If a large job of creosoting is under consideration, or the case in question presents difficulties, the dealer should consult experts of the Forest Service, or those employed by the large manufacturers of refined creosote oil.

Simplicity of Treatment

The most practical manner in which the ultimate object, that is, the protection of wood from decay and increasing its durability to equal that of any of the so-called "permanent" building materials, may be most speedily attained, is to induce landowners and other consumers in rural districts to brush treat with refined creosote oil all structural wood subject to decay, and then for the dealer to sell him the creosote oil.

Other methods of treatment have been discussed at various times, and it has been suggested to the retail lumber field that dealers pur-

chase creosoted material from the commercial creosoting plants carrying this in stock, just as they now do the untreated lumber. It has also been suggested that they should erect open tank plants in their yards, creosoting the material themselves upon request from the customer.

After very carefully conducted surveys the writer has come to the conclusion that for the present, with the exception of yards conveniently located to commercial treating plants or such as are equipped with facilities permitting the installation of open tank treating plants, neither of these propositions is practical. The average retail lumber yard has not enough demand to permit the purchase of creosted stock in quantities sufficient to warrant the trouble, and open tank creosoting plants are not possible due to insurance regulations which prohibit a fire, enclosed or open, within 150 feet of the outside boundaries of such yards. Thus the brush method of treatment is the only practical means at hand by which the propaganda of universal protection of creosoted wood from decay may be furthered in a practical manner, and will gain sufficient momentum so that in the future either one of the more efficient processes discussed may be made available.

It is less difficult to use creosote than paint. A good wide paint brush, preferably wire bound, a common bucket in which creosote oil may be heated, and the "equipment" is complete. Application of two coats of refined creosote oil to all points of contact, and all surfaces which will be exposed, complete the treatment. Thus by the most simple operation, the life of building lumber so treated is materially increased; no skill or special energy is involved.

The utter simplicity of the treatment is the sole danger. It often leads to carelessness which defeats the entire treatment. The fact that posts, sills, or other material treated by the brush method are not entirely impregnated, or black throughout, as for instance a railroad tie, does not indicate that the treatment is of no value or not worth while. This thought should not be permitted to deter anyone from adopting the brush method. It is an absolute fact that two coats of the proper grade of refined creosote oil applied in a heated state to the surfaces of properly seasoned timbers will protect them from decay for a period more than sufficient to warrant the expense and trouble of treatment. Many telephone poles and electric light poles so treated bear evidence of the relative efficiency of this method, and under certain conditions such treatment is made the standard. Coal trestles and other exterior structures have likewise been treated as described with the known result of satisfactory additional life.

Brush Treatment Meets Farm Conditions

The fact must be borne in mind that we have the practical conditions of the farm to meet, and that the brush method alone is available at present. It is economical, easily executed, of great advantage to the consumer, and a source of profit to the dealer.

Creosoting wood, in addition to protecting it from decay, will also prevent destruction by insects such as termites (white ants). Hog houses, chicken coups, and animal shelters of nearly every description are made more sanitary by treatment with creosote. The writer has been informed of cases where creosoted corn cribs have protected the contents from field vermin, and this would also apply to other grain storage structures and buildings of similar types.

In the final analysis coal-tar creosote oil is strictly an accessory to lumber, and it should be handled as such by every lumber dealer for the protection of his own interests in combating substitute competition, because of the service he renders his customers, and for the profit there is in it.

Figuring Out a Retailer's Profits

Explanation of the Difference Between Using Invoice Cost and Selling Price as the Basis for Profit

By H. R. Isherwood

The increase in cost of materials, and additional capital required, coupled with increased operating expense, has caused retailers to adopt more modern methods to meet the additional burden of expense.

To adopt these more modern methods has led them into the mysteries of "cost" to operate with the knowledge of such in mind, and having decided on the net profit over cost they should have, and applied it in their way, the result is further mystery at the end of the fiscal year, and a balance sheet showing a net profit of five per cent. instead of ten per cent. net profit added to cost.

This mysterious loss of five per cent. has greeted many retailers, like a thunderbolt from a clear sky. The answer is: say it cost you 15 per cent. to operate, you added 10 per cent. to your cost, making 25 per cent., and for an example the invoice price on a thousand feet of lumber is $24.00—to arrive at your retail or selling price you have added 25 per cent. to invoice price, or one-fourth, making your selling price $30, or net profit of $6.00, which is 20 per cent. gross profit on selling price, leaving net profit of 5 per cent.

Your trouble is, in the first place, that, in arriving at your cost of operating of 15 per cent., you reached this figure from your gross annual sales, and in adding your percentage of profit, you have added percentage to invoice price, not selling price.

This is not new to all. It is becoming better understood every day, yet there are many in the retail business who will continue figuring their cost on their invoice cost instead of selling price.

The following profit tables taken from the "Lumberman's Searchlight," will enlighten you.

TABLE FOR FINDING THE SELLING PRICE OF ANY ARTICLE

Cost to do Business	Net Per Cent Profit Desired																				
	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	25	30	35	40	50
10%	85	84	83	82	81	80	79	78	77	76	75	74	73	72	71	70	65	60	55	50	40
11%	84	83	82	81	80	79	78	77	76	75	74	73	72	71	70	69	64	59	54	49	39
12%	83	82	81	80	79	78	77	76	75	74	73	72	71	70	69	68	63	58	53	48	38
13%	82	81	80	79	78	77	76	75	74	73	72	71	70	69	68	67	62	57	52	47	37
14%	81	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	61	56	51	46	36
15%	80	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	60	55	50	45	35
16%	79	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64	59	54	49	44	34
17%	78	77	76	75	74	73	72	71	70	69	68	67	66	65	64	63	58	53	48	43	33
18%	77	76	75	74	73	72	71	70	69	68	67	66	65	64	63	62	57	52	47	42	32
19%	76	75	74	73	72	71	70	69	68	67	66	65	64	63	62	61	56	51	46	41	31
20%	75	74	73	72	71	70	69	68	67	66	65	64	63	62	61	60	55	50	45	40	30

Rule.—Divide the cost (invoice price with freight added) by the figure in the column of "net rate per cent. profit desired" on the line with per cent. it cost you to do business.

The percentage of cost of doing business and profit are figured on selling price.

Example.—Cost of lumber, including freight, $24.
Net profit desired 10 per cent.
Cost to do business 15 per cent.
Take figure in column 10 on line with 15 which is 75.

```
75)240,000(32.00 = the selling price.
   225
   ---
    150
    150
    ---
     00
```

The reason why.—While the calculation of expense and profit upon the basis of cost may be arithmetically correct, commercially it is not. The difference provided through the calculation of operating expense and net profit upon the selling price instead of cost creates a defense against contingencies and disappointments such as—

Natural depreciation of stock.
Depreciation through overbuying or mistakes in buying.
Dishonest employees.
Losses by individual bad debts.
Special sales or extra advertising in backward seasons.

The following table shows the percentage of cost which must be added to effect a given percentage of profit on the sale:

5 %	added to cost is	4¾ %	profit on selling price	40 %	added to cost is	28⅓ %	profit on selling price
7½	"	7		45	"	31	
10	"	9		50	"	33⅓	"
12½	"	11⅛	"	55	"	35½	"

The retail building material business is no better than its average practices.

Are yours above or below the average?

Do you figure an intelligent profit or do you hinder your neighbor from making one?

U.S. Shippers Are Given Warning

Shippers were given a warning recently by a member of the United States Railway War Board, that unless the closest co-operation took place between shippers and the railroads there would be a more serious transportation situation a few weeks hence than has ever existed throughout the United States, as a result of the embargo on exports. Unless shippers follow three emergency rules, he predicted, production of all kinds would be slowed down all over the United States, with the result that every branch of industry, labor and the public generally will suffer, and the production of and transportation of war supplies to Europe incur a setback. The member of the war board advised that shippers follow these rules:

"1. Take immediate steps to get governmental permits for the shipment of products now in transportation or awaiting trans-oceanic shipment, and in the future have such permits actually in hand before such shipments are loaded into freight cars.

"2. Load cars to full capacity or up to 10 per cent. in excess of the marked capacity.

"3. Use greater speed in both loading and unloading cars."

Logging Operations in Central Ontario

Methods in Use by the Pearce Company, Limited, Marmora, Ont.—Modifications of Usual Practice Necessitated by Topography of Country

By R. N. Johnston and A. W. McCallum*

The limits of the Pearce Company, Ltd., Marmora, Ont., are located in Lake Township, Hastings County, in the southeastern portion of the Trent watershed. This tract was logged for fifty years previous to 1902, when the Gilmour Company, of Trenton, Ont., sold their limits to the present owners. The Gilmour Company logged for white pine only, and sold out when that species ceased to exist in merchantable quantities. Hemlock and elm, basswood and black ash—hardwoods which it is feasible to drive—and such scattered sticks of white pine as remain are now being logged. The cut this year is estimated at 1,500,000 feet b.m., and the number of logs at 20,000. Cutting at the rate of from one to two million feet a year, the owners expect to be able to continue operating for from thirty to forty years.

Having their own mill at Marmora, which is about sixteen miles from the place where logging is now being done, the company have no trouble in disposing of their logs. The transportation of the logs from the operation of the mill is accomplished by driving, Otter Creek, Beaver Creek, and the Crow River being utilized for this purpose. Labor is at present rather scarce, and is mostly native. Some French-Canadians are employed. For ordinary labor wages run about $35 to $50 a month, with board and lodging.

In addition to their sawmill, which was burned in March of this year, but is being replaced by an up-to-date plant, a planing mill and a grist mill are operated. Formerly a general store was also included, but this was destroyed by fire and was not rebuilt. A portable sawmill, owned by the company and having a capacity of about 15,000 feet a day, is being used to handle this year's cut.

In addition to their former holdings of about 25,000 acres of freehold lands, the company bought outright from the Gilmour Company about 10,000 acres of deeded lands, in addition to some 35 square miles under license from the Provincial Government.

Lumbering has been carried on in this district for a great many years—for longer, probably, than in any other district in Ontario excepting the Ottawa Valley. Formerly, when white pine was being logged, operations were carried out on a large scale; but this stage has passed and the small-scale operation has succeeded it.

Two fire rangers are maintained on the limits for five months of each year. They are paid at the rate of $75 a month, with no allowance for expenses. Small fires occur periodically here, but, owing to the topography, the timber, which is confined to the valleys, is not damaged to any extent.

During the past season logging was done by contract, the foreman having the contract.

Four types may be distinguished in this region, namely:

1. Hardwood Ridge Type.—Beech and hard maple are the leading species here.

2. Mixed Type.—This type is found on the lower valley slopes and in shallow swamps. Hemlock, pine, basswood, maple, and elm are the principal species.

3. Swamp Type.—This is not very extensive in area. Cedar, black ash, and yellow birch, with scattered black spruce and tamarac, are the species composing this type.

4. Burn.—The soil is thin, and commonly in a burnt-over area the bed-rock lies exposed. If any reproduction is present it is white birch and poplar.

The Stand of Timber

For the average stand per acre 1,000 feet may be taken as a reasonable figure. The maximum stand per acre is about 10,000 feet. By actual count on the skidways the percentage distribution of species was found to be:

Conifers, 70 per cent.—Hemlock, 80 per cent.; cedar, 10 per cent.; pine, 10 per cent.

Hardwoods, 30 per cent.—Basswood, 50 per cent.; elm, 40 per cent.; black ash, 10 per cent.

Birch and maple are not being logged at present because of the difficulty in driving them. Slightly over 90 per cent. of the cut is used for saw timber, and the remainder for poles, posts, ties, and shingles.

On the whole, the timber is very sound, especially the hemlock. The timber is straight and of average taper. Any log length down to 8 feet is taken, if the quality is such as to warrant it. The average log contains 75 feet.

The country presents the usual features characteristic of the Laurentian shield—low-rounded, irregular hills, with deep, steep-sided valleys intervening. Evidences of glacial action are very prominent. As might be expected with such topography, logging is very difficult and expensive. The logging units are small and of irregular and unsatisfactory shapes, the ground being of such a character that each operation requires a plan of attack differing, in detail at least, from any other. In many cases no skid roads are needed, as it is possible to roll the logs down the hillside to the haul road in the valley below. The rivers are crooked and rough, requiring many dams, hence driving is expensive when the short distance to the mill is considered. However, it is the only practicable method of taking out the logs.

The winters are of sufficient severity to provide continuous snow and ice, which are of great importance in logging. Operations usually begin early in October and are carried on with but few interruptions until the latter part of March. The snowfall provides an abundance of water for driving the streams.

Water Transport

The Pearce Company drive their logs for a distance of sixteen miles down the Otter and Beaver Creeks and the Crow River to their mill at Marmora.

Dams.—Because of the rough water, dams are very essential in this region. The prevalence of solid rock bottom to the streams provides numerous excellent dam sites. In this country dams are usually small, and are built where needed, with little exercise of choice of site. Some of the larger stop-log dams have, however, where conditions of water flow leave a choice possible, been chosen at advantageous points.

*Graduating students of the Faculty of Forestry, University of Toronto.

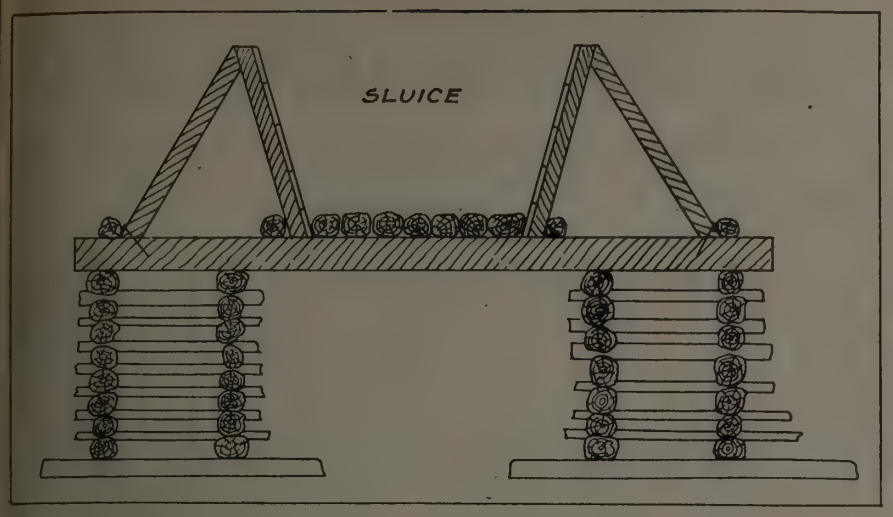
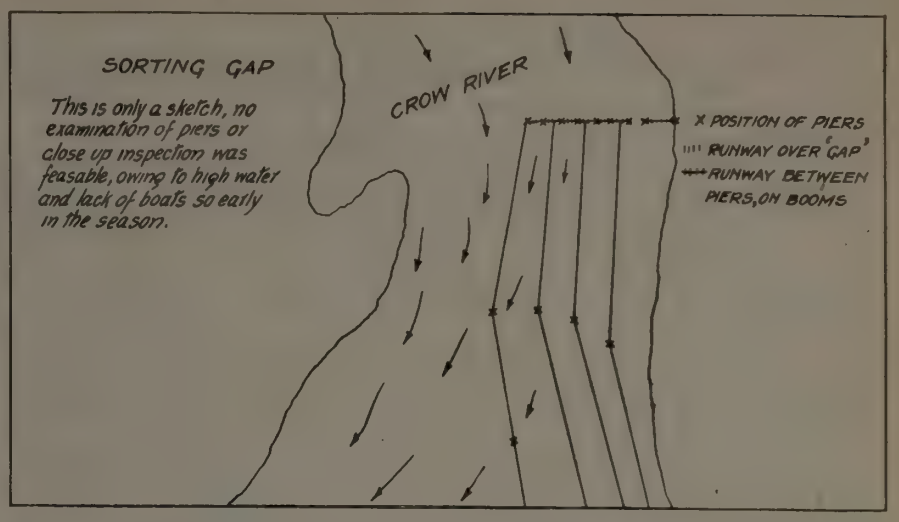
Sluice and dam combined on a Central Ontario logging stream.





such as (1) the outlets of small lakes, and (2) where the solid rock narrows in upon and underlies the stream; such conditions, as a rule, producing rapids or falls. Costs vary greatly, according to season, size, and proximity of materials, but are estimated to range between $150 and $500.

Sluices and Flumes.—In connection with all the dams seen sluices were operated. No flumes are used at present, but one is to be constructed by the Pearce Company at the head of Otter Creek, to overcome a fall of about 50 feet. The sluices were all of timber construction, hewn on four sides and unlined. The only lumber seen around either dams or sluices was used in facing the former, a practice which seemed general. Maintenance of sluices is included in dam charges, and is not very well known, as, indeed, is the case with dam costs generally, inasmuch as both construction and early maintenance were undertaken by the Gilmour Company. Charges for driving works by the Pearce Company are mainly listed as improvements or repairs of old dams. It was estimated, however, that maintenance would not exceed $500 annually for the sixteen miles between the rollways and the mill.

Accumulation of Debris.—Because of good gradients accumulation of debris in the stream channels is not important. The removal of boulders has been effected in a few cases by dynamiting, but this is not usually necessary. Obstructions to driving on this route are at a minimum because (1) the route has numerous and adequate improvements for water storage; (2) the banks are well defined; (3) there is a heavy snowfall; (4) the drive can be completed within three weeks, using only the best water stages.

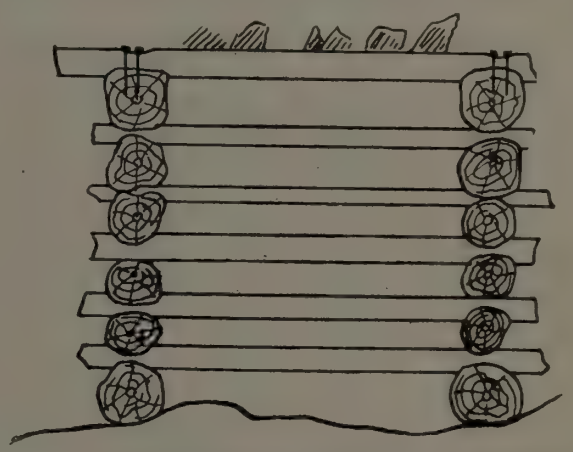
Sorting Gaps.—The third variety of driving works comprise what are called "sorting gaps." An example of such equipment is seen at Marmora, just above the dam in the Crow River. It is used (1) to separate the company's logs from those of other companies driving into and out of Crow Lake; (2) to grade the company's logs. This is necessary because of the mixed character of the drive, the hardwoods being rafted separately where they can be easily landed or recovered if they should sink, no such precaution being necessary with the conifers.

Driving Loss.—Because of the shortness of the drive, the small streams, and the rapid current, little loss is experienced between the landing and the jack ladder, it being stated that only 500 logs were recovered from Beaver Creek when that stream, which has been driven for over thirty years, was recently cleared for the first time.

The Planing Mill

The planing mill is located at Marmora, near the Pearce Company's sawmill and adjoining their grist mill. It operates throughout the year. It was erected about thirty years ago, and will continue to operate until the company's supply of timber is exhausted. Window frames and sash, door frames and doors, and planed lumber are the principal products. The market is chiefly local, very little being shipped to outside points. One specialized product for which there is a large local demand is a double door, for use in winter as a storm-door and in summer as a screen door. Ironing boards are another specialty for which a great demand formerly existed. All kinds of turnery, including interior finish, casings, mouldings, etc., are made as required. Seconds are used for all products except sashes and doors, for which the best pine is required. No definite figure can be given for the total annual output, as it varies greatly from year to year, according to the demand.

For purposes of fire protection three barrels of water are kept on the roof of the planing mill, and throughout the mill fire buckets are kept. No insurance is carried, and there have been no fires as yet. The mill is a two-storey frame building, one end of which is used as a storeroom for the finished products—sashes, frames, etc.

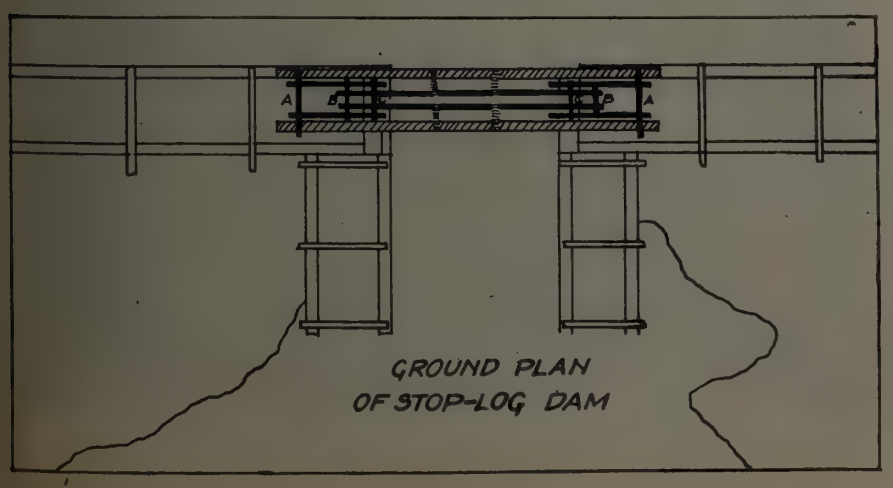


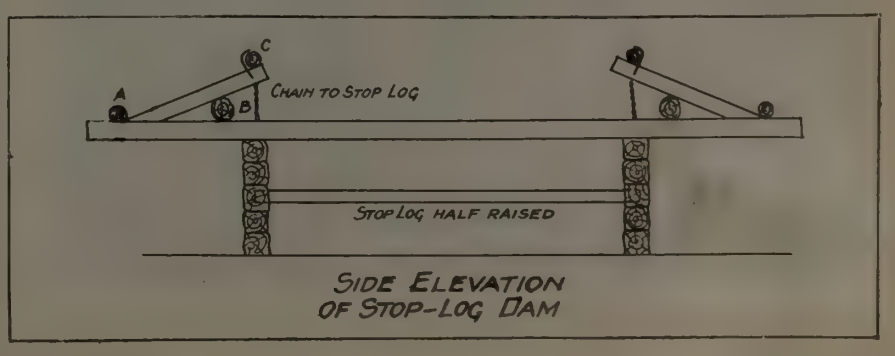
ROCK BALLASTED CRIBWORK
(THE BASIS OF ALL DAMS)

The source of power is a 14-foot drop in the Crow River. Water is stored in Crow Lake, and is entirely adequate for the present plant, the variation of water above the dam never having been known to exceed four feet. The water-wheel which develops power for the planing-mill is about seven feet in diameter. Its rating is unknown, but is estimated at between 25 and 35 horse-power. A 56-inch wheel develops power for the municipal lighting plant, and is rented at $1,100 per annum. The wheels are all of the turbine type.

A list and brief description of the principal machines gives an approximate idea of their work. They are:

1. A wooden hand-lathe, with a set of 12 lathe tools, for general turnery purposes.
2. A planer.
3. One sticker. The most up-to-date and complex machine oper-





ated. It has four cutting heads, which are all adjustable, and may all be used at once or separately.

4. One matcher or tongue and groove machine. This, together with the cut-off and edging saws, comprises the items in the planing process.

The machines used in the sash, door, and moulding operations are all lighter and smaller, and are operated on the second floor. All are of standard types, and the list includes one jig or cut-off saw, one moulder, a band-saw with a three-foot wheel, a sanding machine, consisting of a revolving pad on a swinging arm, adaptable for all purposes, a two-headed sticker, two jointers and tenoners, a hand-clamping machine, and rip-saw.

All planed material is first kiln-dried and then separated, according as stock, orders, or class of material may dictate, the planing and turnery stock being kept downstairs and the sash, door, and moulding upstairs.

Waste products are largely in the form of shavings and sawdust, and these are used for heating the kiln. The kiln is located in a separate building, immediately adjoining the planing-mill. It has a capacity of from six to seven thousand feet, and lumber is left in it from three to four weeks.

Finished lumber is stored outdoors in two long rows of covered racks, which are protected on one side, and which, together with the mill and the office of the company, stand on the four sides of a plot of ground approximately 100 by 200 feet, forming the yard.

Though the whole operation is small, it is typical of the greater number of planing operations in this country. In this case, however, the owners intend to extend the operations to include the manufacture of some specialized products, such as spools, buttons, or clothes-pins, being encouraged in this by the passing of rival concerns and by the prospect of renewed trade after the war.

C. N. R.'s Mill at Foleyet, Ont.

First of a Series of Plants to be Erected in Northern Ontario Will Handle Settlers' Logs

Forced to commence creating a rail haul on the new section of line north of Sudbury and between there and Port Arthur, and at the same time requiring ties for maintenance of way, the Canadian Northern Railway have erected their first sawmill and pulp barking plant at Foleyet divisional point, being one of a series which it intends to construct throughout the clay belt along their line. The first plant is erected at Foleyet, where the line running east and south practically leaves the clay belt section, and the plant is designed with sufficient capacity to handle all of the settlers' requirements in its immediate vicinity; the possible output being 150 cords per day of 24 hours.

The output of the barking plant is being shipped to the mills in Niagara district which have not received pulp concessions from the Crown, such as the Ontario Paper Company and the Beaver Board Company, of Thorold. On this delivery the company receives a rail haul of from $4 to $5 per cord between Foleyet and Toronto, the exact amount depending on the weight of the wood and the point beside the barking plant at which it originates.

The Foleyet plant will, during the coming year, originate $200,000 of freight and passenger traffic, and the continuance of the policy of erecting mills could, within four years, result in originating a freight and passenger traffic amounting to $1,000,000 a year. The pursuance of this policy across the present 500 miles of forests would soon assist materially in the payment of interest on bonds issued on this piece of connecting railway between the western and eastern lines of the system.

The tie requirements for eastern lines of the Canadian Northern are one million ties per year, and the amount of ties being manufactured by the sawmill at Foleyet this year will be 250,000. The sawmill will run day and night for the balance of the season, and the expected output will be at least 2,500 ties per day, together with a large quantity of lumber. The equipment consists of a battery of four boilers, the engine capacity being 250 h.p., which drives both pulp barking plant and sawmill. Tie slabbing is performed by a circular which is preferred to a band mill, and a bull edger is installed for cants. The usual lumber trimmers and edgers are in use, together with tie trimmers, a large hog for furnishing finer fuel to the dutch ovens; a lath mill, shingle mill, planing mill, etc. The filing room machinery is driven by a separately installed engine. A large fire pump is at present being installed. The log haul-up bringing logs from the water up to the slasher was furnished by the Waterous Engine Works Company, Limited, Brantford, Ont., who also supplied a lot of the shafting and other parts for the plant.

The barking plant consists of a Waterous 9-saw pulpwood slasher; one of the 10 x 30 American barking drums delivering to sorting tables, return conveyors and a long outside conveyor having chutes for the loading of ten cars. The design of the latter conveyor also permits of the loading on the return cable of four foot settlers' wood or company wood from cars or sleighs. The first year's output of the mill, although mainly confined to tie timber, will yield 20,000 cords of pulpwood. Both mills and the lumber yard are lit by a 500-light dynamo driven from a separate engine and boiler. The machinery in the main was secured from the company's mills in the west, and this industry and others across the clay belt are designed to afford woods employment and mill employment to settlers going into the clay belt section, together with a market at the camps and mills for hay, oats and other farm products, which is the only systematic method of settling the clay belt.

While the adjacent land has not yet been thrown open to settlement, many are already on the ground awaiting the opening of townships now being surveyed, and already several stores are erected, which would be a credit to any town in eastern Ontario. The fact that the mill site town is a divisional point as well, materially assists development both at town and mill, the latter place being well served with switching facilities due to the one heavy main line engine serving both mill yard and divisional point yard.

Three hundred acres of clearing has recently been made for fire protection, and part of this is being stumped and plowed between the existing woods and the townsite and mill for protection against running ground fires, so prelavent in the north.

The large 300 acre clearing will be mainly devoted to a company farm for the growing of hay and oats for mill and camp horses. This farm will be conducted as an illustration farm for the district, along sound farming lines. As the natural location for the Crown lands office for the district is at Foleyet, intending settlers will be able to see up-to-date farming methods when they are visiting the Land and Recording office.

The timber and milling operations, together with colonization and mining, are in charge of Cyril T. Young, Manager Eastern Lands, Canadian Northern Railway.

The High Cost of Destruction by Fire

A Consideration of a Few Insurance Facts that are too Important to be Overlooked —Some of the Losses that Should be Provided Against

By E. D. Hardy

Appreciation in Values: Every change affecting economic and industrial conditions must necessarily involve a readjustment of our methods of operation, and in this respect the lumber industry is no exception. The abnormal demand for men in the trenches, as well as in other forms of activity incident to the war, has produced a corresponding shortage of labor which is apparent in almost every form of industry. With the necessity for large production and the demand for male labor, has come the inevitable increase in wages, which is one of the chief factors in determining the cost of production. From the log to the distribution of the finished product a substantial advance in the form of "overhead" must be added, which can only result in higher prices to the consumer.

Further, the scarcity of raw materials and the difficulty of importing goods of foreign manufacture has added substantially to the cost of every form of construction. Without a corresponding adjustment of the usual forms of indemnity to new values, it becomes at once apparent that any loss sustained by fire might easily result in serious disaster.

Every fire teaches its own lesson. The increasing nazard to lumber plants characteristic of the summer months calls for earnest thought and consideration on the part of every lumberman as to the effect which a fire in his own plant at this time would produce.

If the experience of those who have already been visited by this common enemy could be utilized to the advantage of those who have so far escaped the ravages of fire, a great deal of unnecessary financial loss and worry could be avoided.

It is not sufficient to know that your insurance is placed with good companies. Without adequate protection and a proper distribution of insurance to the values which a policy is intended to cover, no insurer can expect to recover the full amount of any loss which he may sustain. Too many lumbermen have overlooked the necessity of adjusting their insurance to the abnormal increase in present-day values, with the result that a fire leaves them with a substantial monetary loss, even after the total indemnity afforded by their insurance policies has become exhausted.

No insurance policy can fully compensate the owner for the loss of a plant returning a reasonable and consistent profit. Through the usual means provided for that purpose it is possible to indemnify yourself against the property loss based on the replacement value less depreciation for age and ordinary wear, and in the case of lumber and other materials an opportunity is also provided through the medium of insurance for recouping a loss on the basis of the market value, provided such property is insured in full.

Consequential Loss: At best, however, the usual form of insurance offers only partial protection, as in the case of a manufacturing plant the interruption of trade and the delay in rebuilding is often the most serious loss to the owner.

With a view to meeting the demand which has arisen through the so-called "Consequential Loss" a form of insurance commonly known as "Use and Occupancy," but more properly defined as "Interruption Indemnity," has been provided.

Since the war, the difficulty of securing building materials and the delay in procuring equipment necessary for the complete operation of lumber plants has created an unprecedented demand for this form of indemnity, which is intended to reimburse the assured for the loss in the earning power of the plant during the period or reconstruction and unproductiveness. The rate for this form of insurance is usually slightly less than the premium charged for protection against fire, and is the only means by which the assured can secure even partial immunity from the pecuniary loss consequent upon the happening of a fire which destroys in whole or in part the possibility of further production until the damage can be repaired.

Unprotected Profits: The sudden advance in the cost of certain classes of lumber has left a substantial margin between the purchase price and the market value of the same stock at the prevailing prices of lumber at the present time. This amount represents a substantial profit to the lumberman who is successful in marketing his stock, but in the event of a fire before the lumber is sold it is at once apparent that this anticipated gain might easily be wiped out, thereby suddenly converting a supposed profit into an actual loss.

To meet the legitimate requirements of the trade in this respect, the insurance companies have recognized the demand for indemnity to protect the assured against such loss, which is properly known as "Profit Insurance," the rate of which usually follows the rate under the fire policies, but which in some companies may be obtained at a slight reduction.

In no form of enterprise is the necessity for adaptability to new conditions more apparent than in the business of insurance. That the insurance companies have gone a long way in adjusting themselves to the needs and requirements of the lumber and other industries in helping them to cope successfully with each new situation, is apparent from the different forms of indemnity available.

While the different forms of indemnity indicated above offer a partial measure of security to the large investors of capital, there is nothing to warrant the assumption that a fire should be encouraged as a means of advantage to the man who has insurance. On the other hand, experience has invariably shown that the best form of protection is fire prevention, which consists in eliminating, in so far as possible, the causes of fire. Even after every reasonable safeguard to prevent the destruction of property has been taken, and every available form of insurance exhausted, there still remains the fallible human element which can only be counteracted at the price of eternal vigilance.

Thirty-Two Inch Lath

As a problem in economics there is nothing in the building line more interesting than the use of 32-inch plastering lath. That the demand for them is not greater is simply a matter of prejudice. The dealer refuses to buy them because the plasterer will not use them, but if it were properly demonstrated that it would be a matter of considerable saving to him—that he could pay his lather a handsome premium for putting them on and still be "ahead of the game" it would soon overcome his objection to their use.

Thirty-two-inch lath can be bought for less than half the cost of the standard 4-ft. lath. They can be sold to the trade at a profit equal to what is usually made on the 4-ft. lath and, owing to the lower cost, net a per cent. of profit more than double that made on the 4-ft. lath.

Studding are generally placed 16 inches, center to center, so there is no more waste to 32-inch than 4-ft. . It is simply the matter of a hand-full more nails to the thousand and a little extra labor in putting on.

As an example let us take a small job requiring, say, 10 M. 4-ft. lath. The retail price in most markets for No. 1 white pine lath is $7.00 per M.

10 M. 4-ft. lath at $7.00	$70.00
To cover the same surface will require 15 M. 32-inch lath at $3.50	52.50
	$17.50

Showing a saving in favor of the 32-inch lath of $17.50 (less the extra expense of puting them on). This is the saving to the plasterer.

Now the dealer not only makes the greater per cent. profit on the 32-inch lath but he also does fifty per cent. more business, as it requires half again as many 32-inch lath to cover the same surface.

Have you ever figured this proposition over? It is worthy of your time and if properly placed before your customer will result in increased sales of the short lath with a greater profit to both your customer and yourself. The mail-order houses are making great use of this economy and it may be well for you to look into the question.—Wood Construction.

The recovery of potash from wood ashes is on a profitable basis in a number of plants in the United States at the present time. The other principal industrial source of potash is as a by-product in the cement industry, although only a few of the cement manufacturing companies are recovering this waste from their dust. The Riverside Portland Cement Company, located in southern California, is, however, recovering six pounds of potassium sulphate for every barrel of clinker burned, worth, at present prices, 40 to 50 cents, and worth 18 cents at the pre-war price of 3 cents a pound. The process, therefore, will be a profitable one even at ordinary prices for the potash.

Nova Scotia Lumbering and Shipbuilding

Ups and Downs of Two Great Industries—Vessel Construction Now Extensive—Deal Production Restricted by War Situation

By Elihu Woodworth

A VERY important change in the conditions of the lumber trade of the Maritime Provinces has been caused by the great war. The trade has experienced many changes but most of them have caused, little inconvenience to the shippers, for they consisted chiefly of evolutions of the method of carrying lumber across the Atlantic. Thirty years ago the lumber from these provinces for the United Kingdom was exclusively carried by square-rigged sailing vessels, and as wooden shipbuilding was then a flourishing industry, there was no lack of carriers. The facilities for handling lumber at that time would be considered totally inadequate to-day, and the result was that the shipment of the season's output was a somewhat tedious process. Lumber ports were thronged with vessels taking on or waiting for cargoes, and in Parrsboro Roads—to mention one port—a score of ships and barques might frequently be seen at one time. But a change was at hand, and in the course of a few years the tramp steamer had practically driven the sailing ship out of the lumber trade and forced it to seek employment elsewhere. Some of the oldest ships were hauled up and left to rot, some were sold to the Norwegians and some of the largest and best had their upper masts taken down and were converted into barges for carrying coal or gypsum. The building of square-riggers was discontinued and many shipyards were closed, but a few of the shipbuilders turned off an occasional vessel for the coasting and South American trade. These were chiefly three-masted schooners, ranging from two hundred to four hundred tons register, with now and then a four-master of greater tonnage. Meanwhile the fishing fleet along the Atlantic coast was kept up to its full strength and efficiency and even increased in number and tonnage by the addition from year to year of a number of smart-looking and fast-sailing yacht-modelled schooners of about one hundred tons register. By constructing coast vessels and "Burgess Model" fishing schooners the shipbuilding industry was kept from extinction, but it was practically dead in some parts of the country, and in very few places did it approach its former glory and importance. Lumber operators found it more profitable to prepare deals and scantling for the British market than to get out ship timber and planks for which the demand was very uncertain; the trade with the United Kingdom seemed to be firmly established, carriers could be had whenever wanted and competition kept the freight rates within reasonable limits. No one wanted to buy wooden ships and it became increasingly difficult to get charters for them. The inducements to build wooden ships were becoming fewer every day and it looked as if that industry was doomed.

War's Effect Upon Shipbuilding

Then came the war, the first trouble the lumber dealers experienced was in obtaining bottoms. The steamers were required elsewhere and very few could be obtained on any terms to carry lumber. The square-riggers—once the sole reliance of the shippers—had become almost as extinct as the dodo. True, there was quite a fleet of tern schooners, but the wise men of the sea declared that no fore-and-aft rigged vessel was fit for an ocean carrier. The demand for bottoms became more imperative, freights began to soar above all former experience, and finally some of the schooner owners decided to try the experiment of sending their vessels overseas. The first voyages were eminently successful and these trial trips compared very favorably with the best work that had been done by the ships and barques of former years. Freights continued to ascend beyond the wildest dreams of other days and in a short time every available schooner was under charter to carry lumber to the British market. But now the trouble was that there were not schooners enough, and some shipbuilders saw their opportunity. In shipyards which had been carried on in a half-hearted manner the work was pushed with new vigor; in others, which had been silent for years were suddenly heard the sounds of active life. It was difficult to obtain the required amount of labor, for many of the workmen of former years had become too old to ply their calling, and many of the younger shipwrights had gone overseas to do their bit for their country. The shipbuilders, however, rose to the occasion and did the best the circumstances would permit. Some fine vessels were turned off and added to the lumber fleet, and others were being rapidly constructed. A few vessels were destroyed by the U boats, but the abnormal freight rates made the risk worth taking.

The demand for lumber in the British market was unabated and the French Government was buying some large cargoes. Shipbuilding was increasing rapidly all over the country, the lumber operators made strenuous efforts to secure a large output, and the signs of the times appeared to indicate a prosperous season. Then came the greatest change of all—a change that practically closed the markets of Europe to Canadian lumber. Early this year the Imperial Government gave notice that no lumber would be allowed to leave Canada for overseas without a special permit. A few cargoes were shipped from Halifax and St. John, but no shipments were permitted from any port after the first of May. One result of this drastic war-time regulation is that the lumber shippers are left at midsummer with the greater part of the season's cut on hand. Last winter was exceptionally favorable to lumbering operations, and, although labor was scarce, approximately an average cut was got out. The quantity of lumber held over from last year was probably larger than usual, owing to the scarcity of bottoms, and it looks now as if the shippers would have to face the coming winter with larger stocks on hand than ever before. Practically all the deals of this season's cut remains unshipped, although quite large quantities were sold to the French and Imperial Governments for spring delivery. At present there is no prospect of this lumber being moved, but, of course, it may be sent for before the season closes. Efforts have been made to secure a market for deals elsewhere, but considerable time is required, as a general rule, to change the channels of trade. One large schooner load of deals was shipped from Parrsboro to New York this summer—probably the first cargo of deals ever shipped from this province to an American port. The returns are said to have been fairly satisfactory, but the introductory shipment has evidently created no great demand, for no other cargoes have yet followed it. Some logs, which under ordinary conditions would have been made into deals, have been cut into planks, and have thus found a market in the United States. Small quantities of hardwood lumber have been shipped by rail to American cities with a prospect of more being wanted. Hardwood lumber has hitherto gone exclusively to the British market.

Turning to United States Lumber Markets

The forest products which for years past have found a ready market in the United States consisted almost entirely of spruce boards, scantling, laths and piling, with an occasional cargo of maple logs for lasts, or of spruce poles for flagstaffs, boat masts and clothes props. Pulpwood was shipped in large quantities some years ago, but is no longer exported. The market has been fully up to the average this season, but there are doubts concerning its continuance, for the war is likely to check ordinary building operations. Meanwhile the lumber in demand is being shipped as rapidly as vessels can be procured, and it is probable that very little stock suitable for the American market will be carried over. None the less, however, the future of the lumber trade presents a serious problem. What will become of the deals is a question no one can answer, but the answer seems to depend very largely upon conditions in England and France. If those countries can do without our lumber it will have to be held over; if they must have it they will find some way to get the greater part of it. A curious feature of the situation is that Canadian lumbermen have been instrumental in destroying the Canadian lumber trade for the time being. England and France could scarcely have gone as long without outside lumber if it had not been for the efficient aid rendered by the forestry battalions, and some of these battalions were recruited almost exclusively from the sturdy lumberjacks of the Maritime Provinces. They have already manufactured large quantities of lumber in England and France, and if they can cut enough to supply pressing demands for next winter it follows that Canadian deals will have to remain where they are. If this should be the case it will be a serious matter for the lumber interests of the country. With big unsold stocks on hand and no certainty of a market next year there will be little inducement to send men into the woods to add to the unsold and possibly unsaleable piles of lumber which must be held over. Of course, there will be some lumber cut next winter, but unless the prospect improves, the most of the lumbering will be done by small operators, or as a sort of side line by farmers who have timber limits. High wages and the greatly advanced cost of supplies make the risk greater in any case and will no doubt have a tendency to keep operators from taking chances. Undoubtedly there will be a big demand for Canadian lumber at no very distant date, but no one appears to be able to tell just when that date will be. Therefore,

unless in the course of two or three months there are reliable indications of a strong demand for our lumber overseas the output in the Maritime Provinces will undoubtedly be the smallest it has been for many years. This will throw a number of men out of employment, but it will also afford the shipbuilders an opportunity to obtain at least a portion of the labor they need. The shipbuilders have no trouble about a market, for they can sell at big prices all the vessels they can build, and they could sell many more if they were in a position to build them. Wooden shipbuilding has always been closely associated with the lumber trade and has passed through many vicissitudes. Once a prosperous occupation second to none in the land, it descended by degrees until it became scarcely worthy of notice, but once more its fortunes have advanced and its prospect are far more promising than those of the once prosperous lumber trade.

Newfoundland Industries All Prosperous

Output of Lumber Increased—Shipbuilding Enjoying a Revival—Labrador Forests Attracting Attention of Pulp and Paper Manufacturers

By J. Wilfrid McGrath

THE logging season of 1916-1917 will stand as one of the most successful in the history of lumbering in Newfoundland. The loggers had a good start in the early fall of 1916, with a keen frost followed by a few inches of heavy snow which remained during all the winter months, even until late this spring. The cut undoubtedly was by far the largest we have ever had and the different grades and quality of timber the most diversified. There was a considerable falling off in the amount of pit props cut as compared with the previous season, owing to a scarcity of tonnage to convey same to the Old Country, but all the pulp and paper mills increased their stock of wood by some thousands of cords, whilst all of the sawmills considerably increased their output. The great and marked activity in the building of wooden ships for our coastwise and foreign trade has been the means of extending the lumbering operations to certain sections of our forests, which for years have remained idle. Newfoundland possesses vast areas of the finest of white and red birch, tamarack, locally known as juniper, and witch-hazel. No finer wood can be had for the frames and planking of vessels, than these. Newfoundland birch and juniper are the equal of the best American hardwoods. Hitherto very little of this class of timber was cut annually, as seemingly only small quantities found use amongst the people of Newfoundland in their respective industrial pursuits. Shipbuilding for some years had become almost extinct, as our fishermen preferred having American or Canadian-built vessels for their work; but, owing to conditions brought around through the war, a great revival in shipbuilding has sprung up over all parts of the country, in which millions of feet of birch, juniper and witch-hazel will be used. Thus large sections of forests which remained idle for years, and apparently of no commercial value, are now being used to good account and together with all other "little bits" throughout the Empire will help to win the war. The introduction of our birch wood into the shipbuilding industry may be the means of finding other and profitable uses for it. It seems to me that this wood when properly seasoned could be extensively used in the manufacture of furniture, etc., and seeing that some of the large manufacturers' associations of America have started a campaign of advertising—"birch is birch, not mahogany," there is food for reflection in such an idea, and it is one that mill owners and lumber merchants in this country may take profitable advantage of.

The season's cut of pine, spruce and fir was twenty-five per cent. greater than last season's, and with good driving all logs were brought to the mills early, with little or no delay, and with no additional expense. All over the country, the mills are now sawing full time, and some day and night, cutting up the logs into different sizes and grades. There is a ready and an available market with excellent prices for all that has been cut without going outside the country to sell one cargo.

The following is a list of the prices that were paid locally for Newfoundland stocks in July:—

Lumber

Juniper	Per M. feet	$25.00 to	$30.00
Shingles, cedar, No. 1	Per M. pieces	4.50 to	5.50
Laths	Per M. pieces		4.00
Palings	Per M. pieces	2.00 to	2.60
Spruce boards, No. 1	Per M. feet	20.00 to	25.00
Spruce plank, joisting	Per M. feet	25.00 to	30.00
Studding and scantling	Per M. feet	20.00 to	30.00
1 in. p and t spruce flooring	Per M. feet	25.00 to	30.00
1¼ in. p. and t. spruce flooring	Per M. feet	28.00 to	32.00
1½ in. p. and t. spruce flooring	Per M. feet	28.00 to	32.00
Pine boards, clear	Per M. feet	50.00 to	60.00
Hardwood plank	Per M. feet	30.00 to	35.00

With the advent of the United States to join the allies in the war, much activity has been revived by parties in that country in connection with the development and utilization of the extensive forests of Newfoundland, Labrador, and it is quite possible that this summer two or more large rossing plants will be established in that country. The idea prevailing at present with those who own timber lands in that country is to bark the wood and in that condition ship it to the pulp and paper mills in the New England States. This, no doubt, would be the means of relieving a great want so much felt at present by most mill owners in the United States, as from year to year the difficulty of securing an ample and permanent supply of wood for the manufacture of pulp and paper is becoming more and more acute. In the forests of Labrador quite adjacent to the tidal waters at the head of its great bays and fiords, there are inexhaustible supplies of wood eminently suitable for pulp and paper manufacture and other industrial works. There should be no obstacles in the way of having this wood shipped from the shores of Labrador to the great seaports of Portland, Boston and New York, which would

Sawmill at Bonne Bay, Newfoundland

Pulpwood stock at Grand Falls, Newfoundland.

become distributing centres for other and more distant places. The sea voyage would be much less in distance than from New York to any of the European countries and the risks would certainly be very much less in comparison with those attending shipping on the other side of the Atlantic during the continuation of the war.

The Pit Prop Industry

The shortage in the cut of pit props last winter was due to the fact that tonnage could not be spared to take this lumber across the Atlantic to England. There is an ever ready market for all kinds of mining timber in the English markets, and since the inception of the war upwards of two million dollars worth of this class of wood has been shipped from Newfoundland to England. It seems to me that the pit prop business, if properly fostered and protected, would eventually become one of the greatest industries of this country, from which the laboring classes would reap millions of dollars annually. It was only since the beginning of the war that one was permitted to export from this country pit props, pulpwood, or what past governments were pleased to call unmanufactured timber. That such an absurd law was permitted to remain in force for numbers of years does not speak much for the intelligence of our legislators. For many years past our lumbermen have been cutting annually millions of saw logs and from these logs, millions of ends; the tops of the trees from two to four inches in the small end were left to rot in the forest simply because we had a law which prevented the exportation of unmanufactured wood. These ends, or tops of trees could be used as pit props, which as a side issue to the lumbering business could be made to yield many thousands of dollars yearly to our people. Again, in large sections of Newfoundland, and particularly in Labrador, the forest growth is so dense and thick that the trees do not attain any great size, so that by cutting out the smaller growth, which would make excellent pit props, you are at the same time doing one of the very best things that can be done for the life, growth and expansion of the other trees. The idea our legislators had in view was that the exportation of unmanufactured timber would not pay as much to labor and revenue as if this same lumber were manufactured in the country. Fortunately, both branches of our legislature, and the people of this country in general, have, within the past few years been disabused of such an idea, through the very clear and concise proofs given by Messrs. J. Noseworthy and B. M. McGrath (father of the writer) in a carefully prepared pamphlet which they issued on this subject, a copy of which was placed in the hands of legislators and business men. The idea prevailing that pit props and pulpwood were to be classed with unmanufactured wood is most absurd. The pit prop and pulpwood exported from this country go through a certain process of manufacturing equally as much as a log sawn into deal. Every stick of pulpwood and mine timber leaving this country is assembled, barked, and sawn square at both ends before leaving, all entailing hand labor which certainly pays the laborer more than the mere mechanical process of manufacturing a log into deals at a mill. It is most pleasant to hear from the Old Country that our wood is most suitable for this kind of work, that the mine owners of England want it and hope we will be able to give them full supplies not only during the war but afterwards. One of the largest buyers of Newfoundland pit props is the well-known firm of Evans & Reid, Limited, of Cardiff, Wales, and their agent here is Mr. J. O. Williams, who in a communication to the press a few days ago, on this subject, wrote as follows:—

"Pit props are the tops of trees which are useless for manufacturing into pulp or lumber. Such countries as Finland, Russia and the Scandinavian countries, are just as anxious to preserve their timber as is this country, but the export of pit props has always been allowed from these countries. The timber industry of all kinds—including the pit prop industry—in these countries is a very large one, many times larger than the industry in Newfoundland, and all the arguments that can be used against the pit prop industry in Newfoundland can with equal effect be used against the industry of these other countries. The fact remains, however, that the industry is not only permitted in these other countries, but is encouraged and is a source of revenue to all those engaged in it and there is no reason why the same conditions should not exist in Newfoundland.

"Were the export of pit props to be prohibited from Finland, Russia, Norway and Sweden, the stuff would be left to rot in the forest, as is actually the case in this country. These other countries have seen the folly of this, have seen that money can be made out of this stuff and have permitted its export. Anyone who is cutting pulpwood or timber in Newfoundland has to leave the tops of the trees from two inches to four inches in the small end, in the forest, and I can never understand why the government prohibited the export of this timber, when instead of letting it rot; it could be turned into a commercial article without injury or loss of any kind. If the government are anxious to protect the wood of the country they can do so by forbidding the cutting of trees below six inches at the base, but no protection whatever is afforded by allowing the tops of the trees to rot in the forests, while they may be turned into money.

"I feel confident that the pit prop industry has come to stay and will eventually turn out a very profitable industry to Newfoundland as it has done to other countries, but it must not be forgotten that those who are prepared to invest their money expect to have their rights protected.

"There is no doubt that Newfoundland can compete with Scandinavian countries and Russia in pit prop industry in normal times, and it must be clear that the pit prop industry, taken in conjunction with the other timber industries, will be a further inducement to people to erect sawmills and pulp mills in Newfoundland when they have a profitable market for the tops of trees. Those in authority must surely see the mistake they have been making in forbidding the export of pit props in the past.

"I believe that if the whole question of the pit prop industry were properly explained to the fishermen of the country, together with what it is worth to them, there would not be one voice against it, and surely an industry which has left over $1,500,000 in the country in such a short time, and provided labor at a time when there is no fishing to be done, ought to receive more consideration than it does and less unjust criticism."

Mr. Williams' long experience in connection with the pit prop trade in Russia and other Scandinavian countries qualifies him to speak on such a matter, and it is to be hoped our government and people will profit by the information he has given.

If those in authority would direct their efforts more to the preservation of our forests from fires, they would be doing a work of untold value to the country. The utter carelessness and neglect which have been manifest from time immemorial with regard to the destruction of our forests by fires, until the present government came into power, was criminal in the first degree. It was wrong to export our timber unmanufactured, but it was no harm to see millions of feet of our best timber and hundreds of miles of virgin forests going up in smoke every year. One forest fire can do more damage in a few days than one thousand lumbermen with axes could do in a life time.

Newfoundland Forestry Battalion

Since the beginning of the war numbers of young men who had taken up by the lumber business in all its phases as a means of making a livelihood have from time to time joined the ranks of Newfoundland's First Regiment, and have gone to fight overseas, many of whom will not return again, thereby causing a shortage of expert labor in this line of business. In addition to this loss we are now forming a battalion of five hundred of Newfoundland's best lumbermen, to proceed to England, who will join with other units there, from Canada and the United States, and be engaged in lumbering in the forests of England. This battalion will be increased from time to time until it numbers one thousand. To make up for this shortage of labor in our timber business, numbers of our fishermen and men from other pursuits of labor, will go into the work, and help as best they can to keep the trade going. Men whose fathers fought with Drake and Nelson, and whose sons fought nobly through the Gallipoli campaign, and bled and died on the plains and fields of France and Flanders—of whom it has been said "they were better than the best," who have been keeping ward and watch through three long weary years out on the stormy death-laden depths of the North Sea and over the broad Atlantic, men whose fathers were not afraid to die, in whose veins runs the best blood of the English, Irish and Scotch races.

A Fine Record of Patriotism

Mr. G. D. Campbell, of the Campbell Lumber Company, Weymouth, N.S., has made a contribution to the fighting forces of the allies which is probably unequaled in lumber circles. His seven sons were among the first to volunteer, and while one of them, the eldest, was persuaded, for urgent business reasons, to remain at home, the remaining six brothers went overseas.

One of their number paid the supreme sacrifice at Vimy Ridge, where Canada's sons won imperishable renown. His brother Duncan, was wounded at the same engagement, but Glidden, another of the dauntless six, went through unscathed and was with the storming party that captured the Ridge.

Colin Campbell was wounded at La Bassee in 1915, and again a year later at Death Valley, near Courcelette. It was at the second engagement that Colin won the coveted Military Cross.

None of the brothers were military men previous to the war, but at the call of the fighting blood of their clan they sprang to arms. Belonging to a clan famed in song and story for its readiness and resourcefulness in war, the true form of this branch of the race is further emphasized by the fact that the six brothers from Weymouth have no less than eleven cousins in the ranks; six in the British army; three in the U. S. army, and two in the U. S. Navy—a grand total of seventeen.

Lumber, Lath and Shingle Output in 1916

A Decrease of 9.2 per cent. in Lumber Production—Average Value Advanced by only 61 Cents per Thousand Feet—Shingle Output Greater

The report upon the production of lumber, lath and shingles in Canada for the year 1916, prepared by the Forestry Branch of the Department of the Interior, will soon be ready for distribution. An advance proof of the report has been furnished to the Canada Lumberman by the Forestry Branch and we are thus enabled to publish the following summary of its chief sections:—

This bulletin gives statistics of production by 2,609 mills operating in Canada during the calendar year 1916. The number of mills reporting decreased by 630 as compared with 1915. The value of the lumber, lath, and shingle output for 1916 was as follows: Lumber, $58,365,349; lath, $1,743,940; shingles, $5,962,933; total, $66,072,222.

Canada cut in 1916, 3,490,550 feet board measure of lumber, a decrease of 9.2 per cent. as compared with 1915.

The cut decreased in all the eastern provinces, and increased in all the western provinces as compared with 1915, British Columbia making the most pronounced gain.

Lumber Cut by Provinces

The following table shows the quantity and value of lumber cut during 1915 and 1916, by provinces:—

Province	Quantity M Ft. B.M. 1915	Quantity MFt. B.M. 1916	Value of Lumber $ 1916	Per cent. inc. or dec. in cut over 1915	Average Value per M Ft. B.M. $ c. 1915	Average Value per M Ft. B.M. $ c. 1916
Total, all Provinces	**3,842,676**	**3,490,550**	**$58,365.349**	**9.2***	**$16.11**	**$16.72**
Ontario	1,035,341	894,050	17,848,675	13.6*	18.99	19.96
British Columbia	669,816	875,937	12,932,711	30.7	12.56	14.76
Quebec	1,078,787	818,523	13,722,883	24.1*	16.49	16.77
New Brunswick	633,518	513,655	8,384,397	18.9*	15.63	16.32

Saskatchewan	62,864	84,275	1,189,351	34.1	14.00	14.14
Manitoba	42,357	57,711	850,879	36.2	12.97	14.74
Alberta	17,975	18,350	263,996	2.1	13.60	14.39
P. E. Island	7,543	7,331	118,148	2.8*	15.19	16.12

*Decrease from 1915 to 1916.

Canadian sawmills reported cutting twenty-five different kinds of wood in 1916, which list probably embraces about fifty different species. Spruce, white pine, and Douglas fir have maintained their relative positions as the three leading species for some years without change. In 1916 balsam fir took the place of hemlock which for a good while had held fourth position. Considerable change took place in the year in the order of the twenty remaining kinds of wood, partly because the greater activity of western mills resulted in a greater cut of some western species.

The softwoods contributed 95 per cent. and the hardwoods 5 per cent. of the total production of lumber in Canada in 1916. In 1915 the figures were: Softwoods 94.5 per cent., hardwoods 5.5 per cent. These proportions have remained about the same for several years. Generally speaking, the hardwoods are produced in the eastern provinces, Ontario and Quebec being the main sources of supply. The four leading hardwoods, birch, maple, basswood, and elm, have occupied their relative positions for several years, but in the 1916 list poplar replaces ash in fifth place.

Kinds of Wood Cut

The following table shows the leading kinds of wood cut during 1916 and 1915:—

Kind of wood	Quantity 1915 M Ft. B.M.	Quantity 1916 M Ft. B.M.	Per cent. of Inc. or Dec. over 1915	Total Value of Lumber 1916 $	Average Value per M Ft. B.M. 1915 $ c.	Average Value per M Ft. B.M. 1916 $ c.
Total	**3,842,676**	**3,490,550**	**9.2***	**$58,365,349**	**$16.11**	**$16.72**
Spruce	1,564,113	1,340,678	14.3*	21,201,198	15.24	15.81
White pine	849,196	719,140	14.3*	14,957,048	20.71	20.80
Douglas fir	453,534	574,626	26.7	8,070,200	11.76	14.04
Balsam fir	233,521	180,349	22.8*	2,679,494	14.25	14.86
Hemlock	238,992	177,354	25.8*	2,583,566	13.69	14.57
Yellow pine	35,166	92,698	163.6	1,455,396	13.02	15.70
Cedar	67,366	91,375	35.6*	1,666,455	17.40	18.24

Oak	3,166	3,149	0.5*	92,541	28.36	29.39

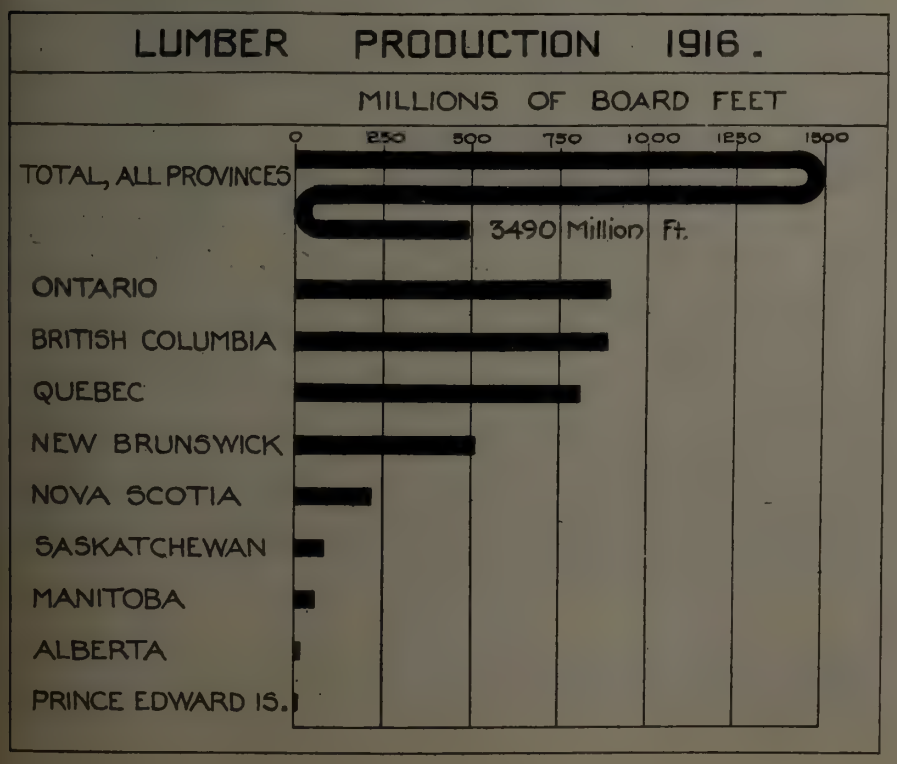
*Decrease from 1915 to 1916.

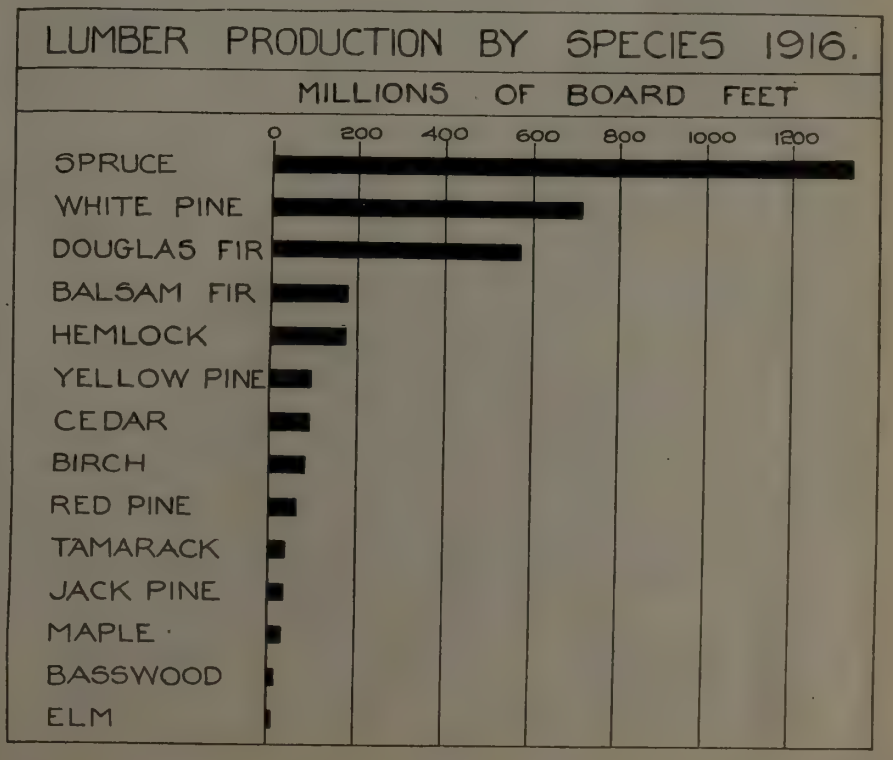
Spruce Production

The production of spruce during 1916 and 1915, by provinces, was as follows:—

Province	Quantity 1915 M Ft. B.M.	Quantity 1916 M Ft. B.M.	Total Value 1916 $	Average Value Per M Ft. B. M. 1915 $ c.	Average Value Per M Ft. B. M. 1916 $ c.
Total	**1,564,113**	**1,340,678**	**$21,201,198**	**$15.24**	**$15.81**
Quebec	599,811	497,241	8,075,194	15.41	16.24
New Brunswick	519,699	426,544	6,923,496	15.66	16.23
Nova Scotia	184,922	144,263	2,015,924	14.61	13.97
Saskatchewan	61,970	84,134	1,187,054	14.00	14.11
Ontario	84,095	65,484	1,186,162	16.33	18.11
Manitoba	39,386	55,741	824,554	12.86	14.79
British Columbia	56,360	49,077	719,687	13.60	14.66
Alberta	13,991	14,772	213,668	13.53	14,46
Prince Edward Island.	3,879	3,422	55,459	15.20	16.21

Spruce is the most important lumber tree in Canada. White





spruce is gradually taking the place of pine for lumber. It has the further advantage of being the chief source of supply for the manufacture of woodpulp. It is also used for cooperage, mine props, railway cross-ties, posts, and rails. Red spruce, which is confined to the eastern provinces, is sometimes preferred for interior finish to the more widely distributed white spruce. Black spruce, owing to its greater hardness and density, is preferred for mining timber and ties. Sitka spruce, a native of the Pacific coast, has the same uses as the other species and is also used for large structures owing to the larger sizes in which it can be obtained.

White Pine Production

White pine was long the leading commercial tree of Canadian forests. Its lightness, softness, straightness of grain, and quality of holding its shape make it a favorite with woodworkers.

The production of white pine during 1916 and 1915, by provinces, was as follows:—

Province	Quantity 1915 M Ft. B.M.	Quantity 1916 M Ft. B.M.	Total Value 1916 $	Average Value Per M Ft. B.M. 1915 $ c.	Average Value Per M Ft. B.M. 1916 $ c.
Total	**849,196**	**719,140**	**$14,957,048**	**$20.71**	**$20.80**
Ontario	623,119	604,562	12,549,487	20.38	20.76
Quebec	157,256	60,439	1,428,174	22.68	23.63
New Brunswick	35,507	32,525	638,764	18.54	19.64
Nova Scotia	25,591	16,354	254,260	21.06	15.55
British Columbia	7,664	5,021	81,048	15.51	16.14
Prince Edward Island.	59	239	5,315	20.27	22.24

Douglas Fir Production

Douglas fir timber and lumber is constantly growing in importance in Canada. It is particularly strong in the qualities which go to make up an ideal structural timber. While the strength and large dimensions in which it can be obtained make it a favorite in the structural field, it is becoming popular for decorative purposes owing to its attractive grain.

The production of Douglas fir during 1916 and 1915 was as follows:—

Province	Quantity 1915 M Ft. B.M.	Quantity 1916 M Ft. B.M.	Total Value 1916 $	Average Value Per M Ft. B.M. 1915 $ c.	Average Value Per M Ft. B.M. 1916 $ c.
Total	**453,534**	**574,626**	**$8,070,200**	**$11.75**	**$14.04**
British Columbia	453,415	574,382	8,067,168	11.76	14.04
Alberta	119	244	3,032	12.31	12.43

Balsam fir:—Balsam fir is gaining rapidly in importance. It now forms a large part of the supply of pulp-making material and is also increasingly used for lumber. It is light, soft, and even-grained, but not strong. It is not so durable as most other coniferous woods. The output of balsam fir was 180,349,000 feet in 1916 and 233,521,000 feet in 1915. The 1916 value was $2,679,494.

Hemlock:—Hemlock is used for rough building construction and for boxes, crates, ties, and poles. Tanning extract is secured from the bark. The wood of the western species is superior to the eastern. It is easier worked and gives a smoother surface. Both species are used to some extent in pulp-making. The output of hemlock was 177,354,000 feet in 1916 and 238,992,000 feet in 1915. The 1916 value was $2,583,566.

Yellow pine:—The wood of the yellow pine is structurally similar to that of the red pine of eastern Canada. The wood in regard to strength, hardness, and ease of working comes between white pine and red pine. Generally speaking, it is being used as a substitute for white pine. This wood was produced only in British Columbia, as follows: 1916, 92,698,000 feet; 1915, 35,166,000 feet. The 1916 value was $1,455,396.

Cedar:—Eastern white cedar possesses, in a high degree, the quality of durability in moist situations. Like white pine, it swells and shrinks very little with changes in humidity in the atmosphere. It is easy to work and has a fine, straight grain. Western red cedar is lighter, softer, and weaker than white cedar, but as it is more abundant than eastern cedar and obtainable in larger dimensions it is in growing demand. The production of cedar was 91,375,000 feet in 1916, and 67,366,000 feet in 1915. The 1916 value was $1,666,455.

Birch:—The various species of birch produce more lumber than any other Canadian hardwood tree. The wood is used for flooring, interior finish, furniture, and for a large number of small articles such as spools, clothes pins, and toys. The production of birch was 81,543,000 feet in 1916, and 85,733,000 feet in 1915. The 1916 value was $1,478,970.

Red pine:—Red pine is stronger and heavier than white pine, and, therefore, more valued for structural purposes. It is more difficult to work than white pine and is used largely for heavy structural framework. It is also used for paving blocks and framework of agricultural implements. The production of red pine was 61,653,000 feet in 1916 and 122,387,000 feet in 1915. The 1916 value was $1,175,835.

Tamarack:—Tamarack, or larch, resembles, in its structure, Douglas fir or southern pine. It is hard, strong, and heavy. It is used in ship-building and for ties and poles. The western species, while somewhat lighter, is used for the same purposes. Tamarack was produced in all the Canadian provinces during 1916, the total being 40,301,000 feet as compared with 36,192,000 feet in 1915. Most of the output—36,651,000 feet, was produced in British Columbia.

Jack pine:—Jack pine wood compared with that of other pines is soft, weak, and brittle. The tree is abundant, however, and the wood is largely used for railway ties, mine props, and pulpwood. As lumber, it is used for rough construction, boxes, and crates. The total output of jack pine in all provinces in 1916 was 37,929,000 feet, valued at $652,353, as compared with 31,283,000 feet in 1915. Ontario led in jack pine production with 17,520,000 feet, Quebec following with 9,622,000 feet, and British Columbia coming third with 7,242,000 feet.

Maple:—Maple is hard, stiff, and difficult to season, but if properly seasoned holds its shape well. It has a great diversity of uses. It is used for flooring, furniture, agricultural implements, vehicles, and handles. The total output of maple was 32,402,000 feet, valued at $497,144, as compared with 35,311,000 feet in 1915.

Basswood:—Basswood is soft, light, and weak, but is tough, has a fine even texture, and is easy to work. It is used for interior work of buildings, also for vehicles, furniture, coffins, and small woodenware. The output was 18,616,000 feet, valued at $373,592, as compared with 24,382,000 feet in 1915.

Elm:—Rock elm is the strongest and most valuable of the elm cut in Canada. Red elm is at the opposite extreme, while white elm, the most aboundant of the three, has qualities between the two. Most of the elm cut is used in the slack cooperage industry. It is also used in the manufacture of agricultural implements, boats, and vehicles, and for building purposes. The production amounted to 15,750,000 feet, valued at $324,582, as compared with 23,795 feet in 1915.

The poplars:—The cottonwoods are the most valuable of the poplars, being light, soft, and easily worked. The wood resembles that of basswood, but is softer and tougher. Poplar wood is used for boxes, crating, excelsior, baskets, wood-pulp and rough construction. The output of all kinds of poplar was 9,064,000 feet in 1916, valued at $124,591, as compared with 9,324,000 feet in 1915.

Ash:—White ash is one of the toughest and most elastic of Canadian woods. It is used in the manufacture of light vehicles, agricultural implements, and handles. Black ash, having an attractive grain, is used for cabinet work. The output was 6,516,000 feet, valued at $126,608, as compared with 9,647,000 feet in 1915.

Beech:—The wood of beech is hard, tough, strong, and heavy. It is difficult to season but properly seasoned holds its shape well. The greater part sawn in Canada is used for flooring and moderately priced furniture. It is also used to some extent for vehicles and boats. The output was 6,403,000 feet, valued at $102,762, as compared with 5,343,000 feet in 1915.

Oak:—Twelve species of oak reach tree size in Canada, but only red and white oak are sawn in commercial quantities. The bulk of this lumber is used for furniture and interior finish for houses. It is also used in the form of veneer, and in the manufacture of tight cooperage, agricultural implements and other articles that demand a heavy, strong, and durable wood. The output was 3,149,000 feet, valued at $92,541, as compared with 3,166,000 feet in 1915.

New Board to Regulate U. S. Freight Car Distribution

Creation of a division of car service to insure prompt movement, distribution, exchange, interchange and return of freight cars was announced on July 12 by the Interstate Commerce Commission of the United States. The creation of the new division is the first definite government step for permanent supervision of traffic movements under the recent amendment to the act to regulate commerce. The urgent necessity for regulation in the distribution of cars has been pointed out to the commission many times by both shippers and carriers. Despite the efforts of the railroads, certain sections have suffered more than others from shortages. The carriers have appointed local car service committees at 25 points and the National Industrial Traffic League has named similar bodies representing shippers at the same points. These committees will hold joint meetings to insure prompt and efficient adjustment of local traffic problems. The new division will develop field forces quickly and probably will place agents in many of the great traffic centers to facilitate adjustments in local shortages, congestions, and other problems. Through this division the commission will regulate car service throughout the country through direct orders to the carriers, with the purpose of dealing with car shortage and seeing that troops, war materials and necessary supplies are moved promptly.

Mr. M. J. McNeil has opened an office at 43 St. Sacrament Street, Montreal, as a wholesale lumber dealer, chiefly in dimension timber. He was previously with the late Mr. John Sunstrum, of Ottawa and Montreal.

Savoie & Co.'s Plant, Manseau, P.Q.

Savoie & Co.'s Expanding Operations

One of the best-known firms of lumber manufacturers and merchants in Quebec is that of Savoie & Co., Manseau, Nicolet County, P.Q., an illustration of whose plant is published herewith. In 1904 Mr. J. A. Savoie, director of the firm, went to Manseau from Brompton Falls. In the same year the company purchased 21,000 acres of timber land near Manseau. Since that time they have been producing 3,000,000 feet of lumber, a few thousand cords of pulpwood, 3,000,000 lath, and 2,000,000 shingles annually at Manseau. The company also operate a general store. The business of Messrs. Savoie & Co. has been increasing from year to year, and they now expect, having purchased a few thousand more acres of timber land, to be operating at this point for at least ten years more.

For two years past Messrs. Savoie & Co. have been carrying on a transit business, and have obtained numerous customers of this nature in Montreal, Toronto, and the United States. The capacity of their dressing mill is 25,000 feet per day. During 1917 they have received so many orders of this class that they have hardly been able to handle the stock coming in from day to day.

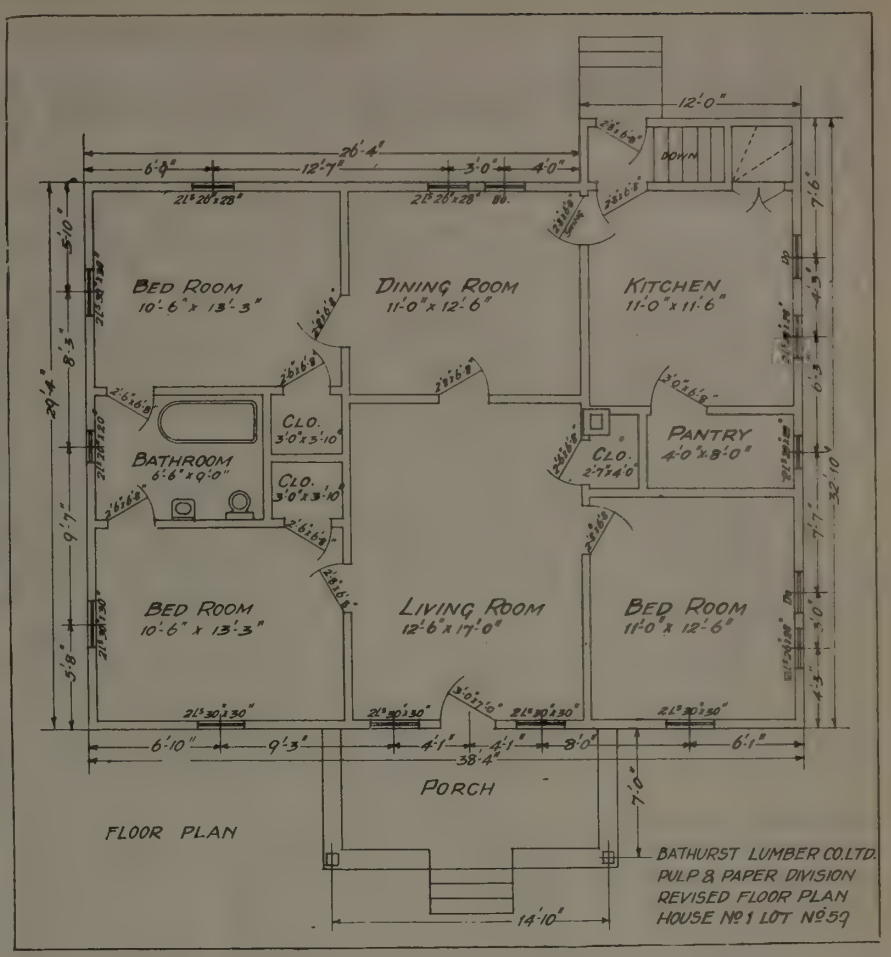
Hon. F. T. Savoie, president of the company, is director and manager of the Savoie & Guay Foundry, Plessisville, P.Q., which has been employing 200 men upon the production of shells during the past two years. Hon. F. T. Savoie was a member of the House of Commons at Ottawa from 1904 to 1911 and of the Quebec Legislature from 1911 to 1913.

Mr. J. Alf. Savoie, director, also operates a retail store at Plessisville, P.Q., and is well known throughout the province. Before going to Manseau he owned and operated a sawmill and a cheese box factory at Brompton Falls, P.Q.

Bathurst Lumber Company's Houses for Employees

Owing to the abnormal growth of Bathurst, N.B., resulting from the rapid development of the pulp and lumber industry, there is at present a great dearth of dwelling houses, and rents are at a premium. Last summer, several hundred new houses were erected, besides a large number of additions to those already in existence, and this season will see a further, and probably greater, increase.

As the growth in population is largely due to the sulphite and craft pulp mill erected by the Bathurst Lumber Company, Limited,



that concern has interested itself in the providing of available accommodation for its constantly growing army of workmen. On a piece of land adjacent to the mill a number of bungalow houses have been erected. Each dwelling is built upon a concrete cellar of its own size and is supplied with water and light, the latter being derived from the company's electric plant. The demand for such desirable premises is naturally large and the company plan to extend the work considerably this season.

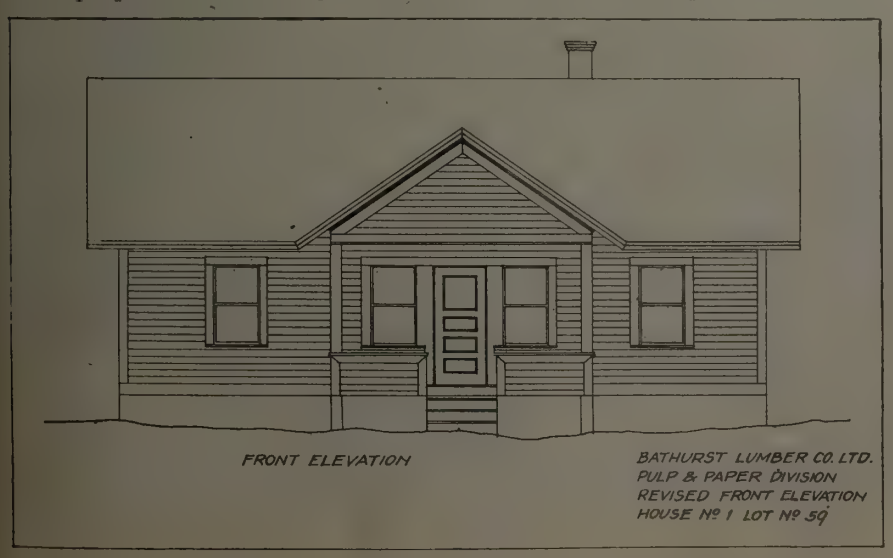
Particulars of the new dwellings are shown in the accompanying plans.

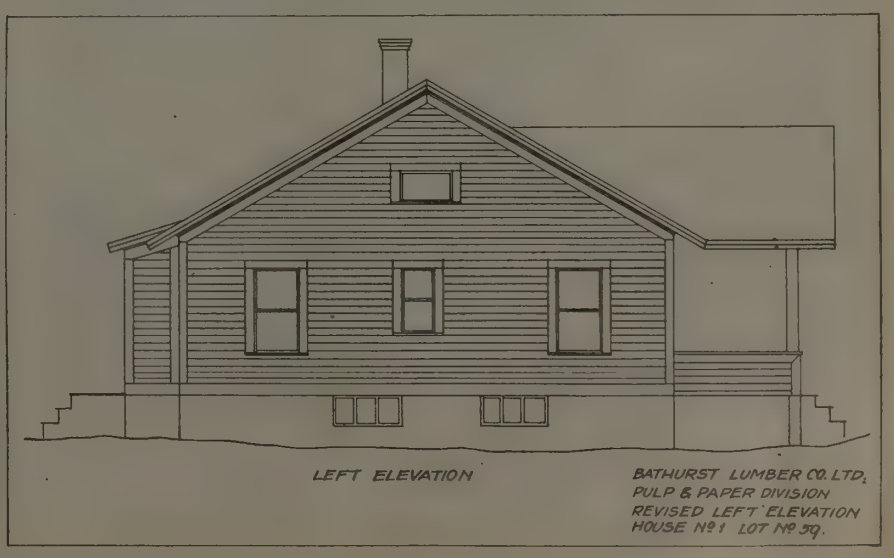
Forest Fires Starting in B. C.

Recent despatches from several points in British Columbia, tell of forest fires commencing. Ten miles east of McBride, B.C., a forest fire broke out, resulting, it is said, from fishing parties not extinguishing their camp fires. All section gangs and extra gangs were sent out to fight the fire, but heavy winds made the work very difficult. The latest report stated that the fire had been burning for four days and was spreading into valuable timber and making its way along the sides of the mountain and along the Shushwap Valley.

A despatch from Nelson, B.C., states that forest fires were spreading rapidly during the fourth week of July, and that the woods were very dry. There had been no rain since June 24th. Later despatches on July 25th stated that the fire in the Trail and Summit Lake districts had been got under control, and also fires in the Corbin and Bull River districts. A large number of men had been available to fight the flames.

In the State of Washington a forest fire was reported which was heading towards Patterson, B.C., near Slocan City.





The British Columbia Lumber Industry

Successful Development During the Past Year in the Face of Many Abnormal Difficulties—Broadening the Export Markets

Written specially for the Canada Lumberman by Hon. T. D. Pattullo, Minister of Lands for British Columbia

AN increase in production of 29 per cent. over the previous year is the record of the British Columbia lumber industry for 1916. The demand calling for this increased production came largely from the prairie provinces and Eastern Canada. The production of shingles and boxes increased considerably, the latter accounting for a total value of nearly $2,000,000.

The early part of 1916 witnessed abnormal weather conditions curtailing production to a point far below the demands of the market. At the same time the beneficial effect of the 1915 prairie crop and eastern industrial requirements were shown by the large orders coming to our mills. British Columbia thus had in the early part of 1916 a very difficult problem to face.

Labor shortage, abnormally bad weather, high prices of, and difficulty in obtaining supplies of all kinds for the camps and mills combined to restrict the output and raise the cost of production. Western energy, however, grappled successfully with the problem, and the balance of 1916 witnessed a remarkable increase in volume of production.

The total quantity of lumber cut in British Columbia in 1916 amounted to 1,280,263,000 ft. B.M., with a value of $35,528,000, compared with a production in 1915 of 99,780,200 ft. B.M., valued at $29,150,000.

The following table shows the value of the forest products produced in British Columbia for the past four years.

Value of British Columbia Forest Products

	1913	1914	1915	1916
Lumber, Coast	$20,400,000*	$15,500,000*	$15,500,000	$21,075,000
Lumber, Interior	6,400,000	3,750,000	.....	.....
Pulp	3,000,000	2,730,000	3,200,000	3,520,000
Shingles	550,000†	650,000†	3,500,000	4,500,000
Boxes	.....	.....	750,000	1,833,000
Piles and poles	400,000	900,000	1,200,000	650,000
Mining-props and posts	250,000	300,000	400,000	1,000,000
Miscellaneous (cut by railroads, mines, settlers, cordwood, etc.)	1,000,000	1,200,000	900,000	1,150,000
Additional value contributed by industries, etc.	1,000,000	1,900,000	1,750,000	1,650,000
Product of Dominion lands	450,000	1,600,000	1,800,000	‡
Lath	200,000	150,000	150,000	150,000
Totals	$33,650,000	$28,680,000	$29,150,000	$35,528,000

*Includes shingles cut from logs. †Includes shingles cut from bolts only. ‡Included in other items.

Our mills started 1916 with depleted stocks and a car shortage, the latter trouble being increasingly felt throughout the year.

The car situation continued to be one of the greatest difficulties in the spring of 1917. Latest reports indicate some improvement in car supply, though unshipped orders on hand are still very heavy.

Each month of 1916 saw the re-opening of mills that had been closed down for various reasons and the building of new plants to handle the business offering. To the present time the demand from our largest market, the prairies, continues good, and with the high prices of pastoral products now obtaining the outlook for this market is most hopeful.

1916 witnessed a remarkable increase in consumption of B. C. lumber in eastern Canada, the quantity sold in the east in 1916 being almost double that of previous years—a most satisfactory showing in a competitive market such as this where native and imported woods are readily available.

Energetic educational work has been carried on by the B. C. Forest Branch in Eastern Canada for the past 18 months, resulting in a wider knowledge and appreciation of the excellencies of British Columbia woods and a better understanding by our mills of the requirements of the eastern market. This market should show substantial increases from year to year and be of great value to our industry. With the return of normal shipping conditions it is hoped to establish a cargo trade from British Columbia to eastern Canadian ports via the Panama Canal.

Very little off-shore business was possible during 1916 on account of the absence of tonnage. With the building of the fleet of auxiliary schooners this condition is being remedied to a certain extent. Three cargoes have already been dispatched this year in vessels built in British Columbia of B. C. Douglas fir and the balance of the fleet is expected to be in commission during the latter part of the summer. All these vessels have been chartered for lumber cargoes to various parts of the world.

With the wealth of forest products this province has to offer to the markets of the world, combined with its geographical location in relation to such markets as South America, Australia, South Africa, India and China, British Columbia should do a large export trade. Some of these markets will take the lower grades which are always produced when high grades are sawn. British Columbia has a large and important market in Canada, but wider markets absorbing all grades will give that stabilizing influence so necessary in the lumber industry to-day. A restricted market dependent on the success or otherwise of a grain crop in one particular part of the world is too uncertain a foundation for a business in so widely applied a staple product as lumber. Therefore, we hope to broaden our business and sell our products in a greater number of markets. We need variety in our markets to absorb all the product of the log. This will enable us to produce more economically with a greater benefit to the consumer.

As a result of a better log market in British Columbia the export of logs in 1916 amounted to but one-half the quantity exported in 1915.

The Pulp and Paper Industry

In pulp and paper production in British Columbia marked activity has been evident during the whole year. All plants in operation have run continuously, producing a total of 80,000 tons of paper and sulphite wood pulp. Three new companies have commenced operations this year, two of which are already producing, and the third will be doing so in the very near future. Our production of pulp and paper in 1917 will probably be double that of 1916.

In addition to pulp and paper developments on the coast large areas of pulp timber are available in the interior, development of which will undoubtedly be undertaken before long. Many enquiries regarding these are now being received from concerns who are beginning to realize that the last great reserves of pulp timber of the continent are in this province.

To sum up, the experiences of 1916 have shown that notwithstanding great difficulties such as shortage in labor and supplies and the confused railroad situation regarding cars, the Pacific Coast province of Canada is struggling successfully to overcome the handicap of war conditions.

Planing Mill Waste for Toys

That a market for virtually all of the waste of a planing mill is to be had for the seeking is evidenced in the occasional bringing to light of what is being done by some planing mill managers in various sections of the country. The latest has to do with a planing mill in the Northern States. In turning out some of its products waste blocks of various sizes were numerous and served to furnish all the fuel required for the plant. This material had a fuel value of $3 a ton.

One day a visitor looked the plant over, noted the waste blocks and began to figure out the number of them in a ton. He offered the manager $17 a ton for all the waste of that character turned out. A contract was made and the visitor informed the manager he was a toy manufacturer and that the blocks purchased would cost him less than half of what it cost him to make them. The mill manager immediately placed his thinking cap in order, secured samples of all the planing mill waste, called on other toy manufacturers and before returning home found a market for all the waste about the plant except the sawdust. The final result is that the sale of the waste purchases all the coal needed for the plant and leaves a profit averaging $300 a month to the company.

A little analysis of the waste products about the saw and planing mills would soon prove that much of the material going to the slab pit has an excellent commercial value.

There was keen competition for the lumber offered by auction at the sale of the assets of Damien Lalonde, Ltd., Montreal, in liquidation. All the lumber, totalling about a million feet, of various descriptions, was sold, and fetched just over 80c on the dollar. The valuation price was about $30,000. Mr. Lalonde has started in business again as a retailer.

An Interesting New B. C. Shingle Mill

Dominion Shingle and Cedar Company Plant at New Westminster—Special Construction and Equipment Problems Successfully Solved

By A. F. Menzies, mechanical engineer

Air-cooled burner.

The opening of the shingle mill of the Dominion Shingle & Cedar Company, New Westminster, B. C., marks a new arrival into the business, in Messrs. Marsh, Hutton, Powers, the well-known New Westminster contractors. The mill is located on the site formerly occupied by the Royal City Shingle mill which was destroyed by fire some years ago. The site is on the Fraser River, above the Lulu Island bridge, just where the North Arm branches from the main stream. A spur line from the British Columbia Electric Railway Company's line to Lulu Island provides the mill with trackage. One of the accompanying illustrations shows the mill as viewed from the bridge with the city of New Westminster in the background. The booming ground, well filled with cedar logs, is shown to the right.

The peculiar shape of the site and the fact that there was a perfectly good burner foundation which it was desired to use, necessitated a mill of rather unique design. The ground being all "made" with sawdust and slabs a substantial and well braced pile foundation was required.

The Main Building

The main building is 30 ft. x 72 ft. and has two floors. An extension about 10 ft. wide on one side forms the packing room on the lower floor and the filing room on the upper floor. The piles supporting the building are spaced 12 ft. centres and are capped with 12 in. x 12 in. timbers laid transversely. Several 10 in. x 12 in. streak sills, with 2 in. x 12 in. joists are interspersed from the beams for the 3-in. flooring.

The upper floor is carried on 10 in. x 12 in. sills supported by 10 in. x 10 in. posts, spaced 12 ft. centres. Above this floor the building is of lighter construction, the studding and roof framing being 2 in. x 8 in. The upper floor is lighted by a row of skylights directly over the machines and by windows in the wall away from them. There are several objections to windows near the shingle machines. The light from them is very much obstructed by the machines themselves and the windows are continually being broken. With skylights above the machines the light falls just where it is wanted and there is very little danger of them being broken. The principal objection to skylights has been their tendency to leak, this defect can be overcome, however, if they are properly constructed. The interior of the building has been whitewashed for the double purpose of diffusing the light and as a certain amount of protection from fire. Outside, the buildings are sheeted with galvanized, corrugated iron.

The log haulway is built up on piles spaced 10 ft. centres, the lower section being hinged to enable it to be lifted above the water for repairs. On account of the rise and fall of the tide (about 8 feet) it was necessary to carry the haulway a considerable distance into the river. The piles are capped with 12 in. x 12 in. timbers on which stringers are laid, the latter carrying the 8 in. x 8 in. ties on which the haulway is built. To overcome the tendency of a long log to tip when its butt is at the swing saw the upper end of the haulway, for about 31 feet was made level, care was also taken to get as easy a grade as possible.

The log chain is 1½ in. x 9 in. long link, it is fitted with a number of cast steel chairs provided with teeth, making it unnecessary to dog the logs. The chain is driven by a double geared log jack, belted to the main line shaft. The driving sprocket which is located well back and below the level of the swing saw is fitted with five reversible teeth. All the transmission machinery and the machines on the lower floor were supplied by the Puget Sound Machinery Depot, Seattle, Wash.

The swing cut-off saw is 84 inches in diameter and is carried in a well-braced timber frame which is hung independently of the upper shaft. When locating the swing bearings care was taken to see that the saw would cut through as large a log as possible and yet put the least load on the feed works and avoid the possibility of the brake slipping and the saw slamming into a log, which, it goes without saying, is detrimental to the saw. The feed is by friction wheels working a single rack and pinion, a brake being provided and arranged so that when the friction is off the brake is on.

It will be noted from one of the illustrations that the swing saw is on the opposite side of the mill from the other machines, this made a reverse drive necesary for it. The reverse was obtained by a goose neck belt, the upper pulley of which was located on the level of the upper floor above the recess provided for the feed works of the swing saw. The upper pulley is on an adjustable frame which provides means of relieving the tension on the belt when not in use. The drive from the upper shaft to the saw arbour is provided with a belt tightener arranged to increase the belt tension as the saw gets into the logs.

To drive the swing saw and the two following described saws, friction pulleys are used on the line shaft, arranged with lever control for convenient operation. A large Covel Manufacturing Company's automatic saw gummer is provided for upkeep of the 84 in. saws. The saws being handled from the arbour to the gummer by means of a light chain block running on an overhead rail.

To gauge the length of the shingle blocks a steam log stop is

Dominion Shingle & Cedar Co., Ltd., New Westminster—General view of plant.

Dominion Shingle & Cedar Co., Ltd., New Westminster—The log deck.

provided. It consists of a steam cylinder and piston located under the floor and well secured to the beams. The piston rod is connected to an adjustable stop block which works through a heavy cast steel guide bolted to the floor. The stop block is made so that it can be easily adjusted to give either 16 in. or 18 in. blocks. The log stop is handled by a lever located conveniently to the man operating the swing saw.

The discs cut from the logs are split into convenient sized shingle blocks on a steam feed bolter equipped with an inserted tooth saw, 60 inches in diameter. The saw and arbour are fixtures, while the table on which the timber is laid is fed in by the steam cylinder. To reduce the power required to feed the table it is carried on iron wheels running on rails, while to facilitate the handling of the timber the table and the floor between it and the adjacent machines are sheeted with steel plate. Some of the discs from the larger logs require to be split into four or six pieces before they are small enough to be handled.

The bark, knots and other visible defects are removed from the blocks by a knee bolter. This machine has been accused of being a timber waster; but in the hands, or rather, knees and hands of a good operator, very little need be wasted. By removing the bark, which often contains sand, etc., a considerable saving of shingle saws is effected. Also, if the timber has defective portions the sooner these portions are on the refuse conveyor the better.

The foregoing machines are all located on the lower floor. Care was taken in the location of them in relation to each other, so that the timber could be conveniently handled without crowding.

From the knee bolter the shingle blocks are thrown into an inclined conveyor. The foot of which is located so that the knee bolter operator simply gives the block an extra swing when making the last pass and it drops into the conveyor. At the head of the incline the blocks are dumped sidewise into a hopper along the bottom of which the distributing conveyor is run.

This conveyor runs the length of the mill on the upper floor and carries the blocks in a reverse direction to that in which they were travelling on the lower floor. The blocks are picked off the conveyor by hand and are either placed on the tables at the machines, or, if more blocks are coming up than are required, they are stowed on the side opposite the machines, ample space having been provided for this purpose. By having this storage space it is sometimes convenient to run one shift on the log deck and two shifts on the shingle machines. If it is desired, additional shingle machines can be installed and the log deck run double shift.

A New Shingle Machine Design

The five shingle machines installed are of a new design recently got out by Mr. H. Schaake, of the Schaake Manufacturing Company, New Westminster. This is the first mill in which these machines have been installed and on that account they are given a slightly extended description.

The machines are of the upright type having a cast-iron frame of "L" section. Special care has been taken in the design to resist the stresses set up by the reciprocating motion of the carriage. The carriage guides, both top and bottom, are of square steel, set corner up, the upper slipper being made adjustable to compensate for wear, while the guides themselves can be reversed when worn and so get a new lease of life. The carriage itself is cast in one piece with the corners well stiffened. All the usual adjustments of the arbour, to give the desired lead to the saw are provided. In place of the usual weights to hold the top jaw on the block, a spring operated holding device has been adopted. This is much quicker and holds the timber more firmly than the weights.

Dominion Shingle & Cedar Co., Ltd.—One of the new shingle machines.

The heart of any shingle machine, and perhaps the most noteworthy feature of the "Acme" machine, is the set works and spur roll clutches, which are the outcome of the expenditure of considerable time and money for experimental purposes by Mr. Schaake. In the older types of machines with toothed ratchets and fixed travel of the setworks the thickness of the shingle depended on a combination of the size of the spur rolls, number of teeth in the ratchets and the kerf of the saw. On the "Acme" machine the setworks are arranged with an adjustable travel and positive clutches on the spur rolls. This arrangement permits any thickness of shingle to be cut by adjusting the nuts "A" for regulation of the butt, while the tip thickness is adjusted by means of the set screws "B," shown in the illustration. These adjustments are entirely independent of each other.

A grainer attachment is also provided enabling the sawyer to cut a succession of butts from either end of the block, at will. A considerable saving of timber can be effected by judicious use of the grainer, as a slight defect, which, if it was in the butt of the shingle would cause its rejection, can be kept in the tip where it does no harm. The grainer is simple in operation, the rod "C" being moved by pressure from the sawyer's knee cuts off the setworks ratchet and consequently the cams are not turned.

Some sawyers like a machine which cuts two butts in succession from each end of the block. To provide this variation it has been usual to carry an extra set of cams. By an ingenious arrangement this is accomplished by altering the angle of travel of the set works lever by shifting the pin "D" into hole "E."

As the shingles are sawn they are picked up by the sawyer and the edges trimmed on the usual jointer saw, which, of course, forms part of the shingle machine. They are then thrown over the machine into a chute which carries them to the packing floor below. The shingles are packed into the familiar bundles in shingle packers, which were also supplied by the Schaake Manufacturing Company.

The bundles are placed on a long conveyor which takes them to the entrance of the dry kilns. This conveyor consists of two lines of ½-inch common round link chain let into wooden stringers, the chain projecting sufficiently to carry the bundles. The illustration of the burner shows this conveyor on the right. The chain is drawn by pocket wheels and an automatic tightening device is provided to compensate for wear.

The Power Plant

Steam is provided for the plant by a 72 in. x 18 ft. Jenckes Machine Company's boiler. The fuel is burnt in a "Dutch" oven furnace which is rather larger than usual, but its size is amply justified by the excellent steaming abilities of the boiler.

The main engine is a twin 12 in. x 16 in. Houston Stanwood & Gamble, running at 160 r.p.m. It has a band wheel 72 inches in diameter by 16 inches face, carrying the 15-inch driving belt to the main line shaft. The belt, and the others in the plant are of the Goodyear Extra Power brand. The line shaft, as previously mentioned, runs along the lower floor and is carried in post boxes secured to 10 in. x 12¼ in. machinery posts, which are in turn secured to streak sills below and cross beams above. One point worthy of notice here is the method of oiling the line shaft bearings. The bearing caps are cut away completely where the bottom of the oil box usually is. This makes a large opening right down to the shaft which is filled with grease, a light cover to keep the dust out is also provided. The grease only requires to be pressed down occasionally and, should a bearing heat, a good supply of lubricant is automatically available.

Refuse, the largest by-product of the lumber business, is removed by a long main conveyor running the length of the mill and below the lower floor. On account of the grade to the burner (the foundation of which was already made) it was found necessary to make this conveyor in two sections. Two other conveyors, one for spalt and the other for sawdust, run below the upper floor and take the refuse from the machines, from which it is discharged by chutes. These two conveyors are arranged to discharge either into the main conveyor or into the two conveyors running to the boiler house, by means of a "Flip Flop."

An Air-Cooled Burner

The burner is of the air-cooled type and was the first of its kind constructed in Canada. It was built by the Walsh Construction Company, of Vancouver. This type of burner being of light construction is easily built and should be economical to maintain. The foundation is of brick, into which a grate in the form of a cross is built. The burner and the main refuse conveyor are well shown in one of the illustrations. The superstructure is carried on 6-inch "I" beams fastened to and projecting from the foundation. The shell commences at the outer end of the projection which is sufficient to give an air space of about 14 inches all round. On account of the draft

a large quantity of air enters this space and on account of the shape of the burner this cool air hugs the sides and prevents the hot gasses from coming in contact with the thin shell. Of course, the radiant heat from the fire itself reaches the shell; but it does not seem to be sufficient to cause any trouble.

The main supporting frame consists of light angles running vertically, on to which are clamped a series of hoops of ¼-inch pipe. The sheet iron covering is No. 16 B. W. G. thick, and is fastened to the pipe hoops with clips. To prevent sparks getting out a spark arrester of wire mesh is provided at the top. It will be seen from the foregoing that this type of burner will make a much better proposition to the man who foots the bill than either a brick or a heavy plate burner.

There are two brick dry-kilns in which the shingles are dried before shipment. The kilns are each 20 ft. by 120 ft. and have three lines of rails on which the trucks run. To avoid having to push the trucks through the kilns they are built with a down grade towards the outlet end of approximately ¼ inch per foot of length. A kiln full of shingles is carrying rather a heavy load. That this load is often underestimated is proved by the number of kilns which have sagged. In this case the piles in the foundations are spaced 4 ft. by 5 ft. under the walls and 8 ft. by 5 ft. under the rails. The heating surface of the kilns is provided by a series of 1-inch pipes run nearly the full length and all connected to a feeder header at the upper end and a drainage header at the lower end. Steam is supplied at a reduced pressure through a Foster reducing valve. At the lower end the drainage is all returned to a feed water tank near the boiler by means of two Johns-Manville steam traps. To have permanent and reliable record of the temperatures in the kilns at all times two Bristol's temperature recorders with seven-day dials have been installed. Like the burner, the dry-kilns were constructed by the Walsh Construction Company, of Vancouver.

At each end of the kilns a large platform has been constructed for handling the bundles onto and off the trucks. Mathews gravity conveyors being provided to facilitate this work.

One result of the drying of the shingles is to slacken up the bundles considerably, to tighten them and also reduce the size to enable more bundles to be got into a car a steam shingle press is used.

The capacity of the mill necessarily varies, according to the quality of the timber. Each of the five machines is rated at from 30 to 45 thousand shingles per day of ten hours. The mill was designed and constructed under the supervision of Mr. F. L. Johnson, who is now in charge of its operation.

The Red Cedar Shingle Industry of B.C.

Its Success Based Upon Good Grades Well Maintained — Producing Costs Increased by the War

By R. D. Hyde

THE manufacture of red cedar shingles is one of the greatest industries in British Columbia. There are about 90 mills in the province, with an aggregate of 390 machines, actively engaged in this work, the magnitude of which may be reckoned by the fact that for each machine a plant investment of from $5,000 to $8,000 is necessary. There are produced annually in British Columbia more than two billions of red cedar shingles, about 60 per cent. of which are exported to the United States.

British Columbia shingles, solely on their merits, have made a market for themselves across the line. The Eastern States in particular demand, for the most part, shingles of better quality than are generally made in Washington, and are willing to pay the premium over Washington shingles, which is necessitated by the higher grade, and consequently higher producing costs of British Columbia shingles. It may be well to state here why superior shingles are manufactured in British Columbia to those that are commonly produced across the line. It is not because the timber is better on our side than on the American side, although for their low grades it is possible for the Washington mills to cut a smaller class of logs than the British Columbia mills can use. The superiority of the British Columbia shingles is due to the fact that the grading rules for both American stars and clears permit the inclusion of flat-grain shingles, while the British Columbia grading rules call for strictly edge-grain shingles. These cannot be made to advantage from small logs, because, being quarter-sawn to obtain the edge grain, the resulting shingles would be too narrow to be acceptable.

Good Grades Involve Higher Producing Costs

British Columbia manufacturers, in maintaining their grades, find their sawyers cannot cut anything like the number of shingles per day that is possible, and almost required of the sawyers in Washington. The sawyers in British Columbia average about 25,000 shingles per day, against 40,000 to 50,000 which is common across the line. In other words, shingle manufacturers in British Columbia find it necessary to sacrifice quantity in favor of quality. Approximately the same amount of day labor is necessary to handle both a small and a large cut, so that the manufacturing cost per thousand is much higher for the small than for the large cut. The shingles from British Columbia which are in greatest demand in the United States are known as B.C. XXXXX. They are 16 in. long and five butts placed together will measure 2 in. when green. These shingles have only the advantage of additional thickness over the XXX shingles commonly used in Canada, which require six shingles to measure 2 in. at the butts when green. The grades, aside from this, are identical, but the added thickness of the XXXXX shingles makes possible an increase of ten or twelve years in the life of a roof, and Canadian consumers, particularly those in Ontario, are beginning to realize the value of this point.

The war, as in practically every line of endeavor, has made itself strongly felt in the shingle industry. Caused by it, manufacturing costs have doubled and business has been greatly retarded. The labor situation in British Columbia, due to the war, is very serious. There are not as many available men as are required, so that the manufacturer can never be certain how many of his crew will be in his employ the next day. Labor fully realizes the advantage it has, and is constantly making demands for higher and still higher wages, before which the manufacturer is helpless. In the shingle industry wages for ordinary labor have increased over 100 per cent. during the past year.

Labor and Transportation Difficulties

The shortage of raw material—that is, logs and bolts—which, in turn, is largely due to the labor shortage, has probably been the most active force affecting the manufacture of shingles. In accordance with the law of supply and demand, the price of raw material, due to the shortage, has advanced nearly 100 per cent. in the past year. The present cost of logs and bolts is actually higher than was the selling price of finished red cedar shingles a little over a year ago. The late spring and heavy snows kept logging crews out of the woods much longer than is usual, and, owing to the fact that this is the big salmon year, a large percentage of bolt cutters have gone fishing, which they find is temporarily more profitable.

The car shortage, which has been experienced all through the year, has been reflected strongly in the shingle industry. Owing to the fact that the shingle business is more or less seasonable, it is impossible for manufacturers to avoid the acceptance of orders for future shipment. British Columbia mills had orders for nearly 2,000 cars of shingles booked ahead early this spring. The car shortage, with its attendant embargoes, made it impossible to move a large percentage of these orders when they should have moved, and at the same time manufacturing costs were increasing by leaps and bounds, so that when mills were finally able to make their shipments, the shingles were actually costing them more to produce than they were receiving for them. Again, owing to the labor shortage, mills were forced to operate or lose their crews, with no certainty as to when or where they would be able to get others. Consequently, shingle production was far in excess of shipments, which required the building of large storage sheds. This necessitated another direct loss, because, owing to British Columbia's damp climate, shingles stored for even a period of two weeks absorb a great deal of moisture, thereby adding to their weight and consequently the amount of freight charges. Many mills when they had cut to their storage capacities were forced to shut down, and, for reasons before mentioned, were also forced to keep their crews intact during the time they were not operating, which added greatly to their overhead costs.

Shingle prices following, and as a result of all these increased manufacturing costs, have advanced to a higher point than they ever before attained, and it is thought that they will go still higher before the year is over. Manufacturers fully realize that the high prices for shingles encourage the use of prepared roofings, but they also realize that until some means can be found to reduce manufacturing costs shingle prices cannot come down and still permit a margin of profit for their manufacture.

Modern Shingle Mill on the Fraser River

Brunette Sawmill Company, Limited, New Westminster, Operating Electrically Driven Mill with the Latest Type of Equipment

Gradually a very superior type of plant for the manufacture of shingles is taking the place of the hastily erected, ill designed and inadequately equipped mills which—despite these drawbacks—have been successful in making the quality of British Columbia red cedar shingles famous throughout the length and breadth of the American continent. Probably no better shingles are turned out in the new plants than in many of the antiquated ones, where the careful manufacturing methods of the past are still being enforced to the very letter, but the fact that within the past few years most waterfront mills have been compelled by the increasing scarcity and higher price of bolts to install costly machinery for the utilization of the entire log has in itself hastened the coming of the modern type wherein the higher cost is more than offset by the saving effected in labor, the increased output per machine, and greater uniformity of product.

Probably the most finished example of the modern type of shingle mill is the new electrically operated plant of the Brunette Saw Mill Company, Limited, at Sapperton, New Westminster, which replaces one destroyed by fire on August 24, 1916, after ten years' service. Work on the new mill was commenced November 6th, but owing to shortage of labor the working gang never exceeded twenty carpenters and millwrights, so that it was near the end of May, 1917, before the machines were started up.

The main building is 32 x 132 feet, two storeys in height, with steel roof, and stands on a high post foundation, it being the intention to use this space when necessary for storage purposes. From the standpoint of fire protection the building is in the preferred class, being of heavy timber frame construction, the joists and cross beams being surfaced to prevent the accumulation of fine cedar dust, which is almost an explosive and particularly dangerous in case of fire. The machine room in the second storey will accommodate seven machines, but at present only five are installed—three Sumner and two Letson and Burpee uprights—each driven by a 23 h.p. direct-connected motor.

One of the new devices to be seen only at this plant is connected with the operation of the log haul which delivers the timber to the sawing dock. Practically there is a twin log haul on one slip, the bull chain being in two sections. The first section from the water edge will handle four logs in tandem; the head log is delivered onto the top chain, which feeds it to the cut-off sawmill until only a six-foot section remains, when the next log is advanced and pushes the short section forward, and so on continuously. The equipment on the sawing floor comprises 84-inch cut-off (E. C. Atkins Co.), 58-inch chain splitter (new design), and 54-inch knee bolter, both being made in the well-equipped machine shop on the company's sawmill premises. The shingle machines are ranged along the right-hand or north side from the log-haul, the bolts passing along a conveyor to the sawyers. The latter work under health conditions enjoyed in few mills, each machine being connected up to a powerful blower system installed by John K. Miller Co., Ltd., Vancouver, which carries away every particle of dust thrown out by the swiftly-revolving saw. The shingle packers' bins are on the south side of the lower floor, a chain conveyor running along the north side. The finished bundles are delivered onto cars at the westerly end of the packing floor, which when loaded pass along the tracks leading to the kilns, where the shingles undergo a gradual drying process for seven or eight days before being transferred to the storage shed or the railway car on the siding alongside the latter. The ten-hour cut of the five machines averages 160,000 shingles day in and day out; with two more in operation the output will reach 220,000 shingles. The policy of the Managing Director, Mr. Lewis, is not to go after a record for production, but to make the quality of the article is the prime consideration, as it has been for years.

Ample Power Installation

The boiler house, 30 x 50 feet in size, two storeys, is constructed of 2 x 6 in. cribbing, and contains two 72 in. x 18 ft. boilers with Dutch oven fuel feed. The engine room adjoining (under the same roof) is 24 x 34 ft., two storeys. This contains one Robb-Armstrong 16-inch side crank tandem engine direct connected to Canadian Westinghouse 200 k.w. generator, complete with exciter, rheostat, switchboard, etc. The motor installation receiving current from the generator as follows: One 50 h.p. motor operating double log haul and cut-off saw; two 40 h.p. motors direct connected to knee bolter and splitter; five 20 h.p. motors and five 3 h.p. motors direct connected to shingle machines; one 20 h.p. motor driving the refuse burner conveyor; three 10 h.p. motors operating the block conveyor, boiler conveyor and blower fan; one 7½ h.p. motor driving the filing room equipment; one 1½ h.p. motor operating grinder on big cut-off saw.

Interesting Plant Notes

There are four dry kilns of standard type occupying a space of 52 x 96 feet. They are of cribbing construction, plastered inside, with tar and gravel roof, and were erected by the company.

The storage shed, 52 x 125 ft., is of sufficient capacity to handle the output of the kilns with room to spare. It is equipped with transfer tracks and Mathews Gravity Conveyor sections for car loading purposes.

The refuse burner, of the air-cooled type, is 32 ft. diameter by 54 ft. in height, and was erected by the Walsh Construction Co., Ltd., Vancouver.

In addition to being connected with the New Westminster water system the company has installed a fire pump with a capacity of 500 gallons per minute. Six-inch mains reach all parts of the plant, serving four outside hydrants and six inside, the buildings. Almost absolute protection from fire is further assured by the automatic sprinkler service installed in the shingle mill, boiler house, engine room and dry kilns by the General Fire Extinguisher Co., Ltd., Vancouver.

The interior of the several buildings received a coat of whitewash prior to starting up, the improvement effected to the lighting being very marked. The exteriors will be painted red, with white trimmings, which will give the plant a very smart appearance.

Construction work throughout was carried out under the joint supervision of J. T. Mackie, master mechanic with the Brunette Sawmill Co., Ltd., and C. P. Bussey, construction foreman for the company, who became superintendent of the mill when it was started up on June 1st.

The approximate cost of the new plant was in the neighborhood of $60,000.

B.C. Interior Trade Improving

Demand and Supply Approaching a Better Balance Permitting Production at Moderate Profit—The Labor Scarcity

By I. R. Poole, Sec. Mountain Lumber Manufacturers' Association

GENERAL conditions surrounding the lumber trade in the interior of British Columbia have gradually improved during the past two years, and although prices have advanced considerably since the spring of 1915 they have not advanced as rapidly as the increased cost of production would warrant. Compared with the selling price in 1915, lumber to-day is from 30 to 50 per cent. higher, but in making this comparison it must be remembered that during 1915 and for some years previous, lumber was sold below the cost of production; in some cases below the actual cost of the saw logs. The increase referred to therefore does not mean that the profit of the lumber manufacturer has been increased by the percentage shown. Compared with the more normal year of 1912, when the average price received by lumber manufacturers as a whole was below the cost of production, the current market price represents an increase of about 20 per cent. The increase in the cost of labor and supplies entering into the cost of producing lumber has, during the same period, been considerably greater than the advance in the price of lumber; labor representing an increase of 25 to 50 per cent., and mill supplies, such as machinery, machinery parts, belting, steel, wire rope, saws, etc., from 50 to 100 per cent. Hay, oats, meats, butter and other camp supplies have also increased from 25 to 100 per cent. Entering also into the increased cost of production is the scarcity and inefficiency of labor. Recruiting for forestry and other battalions for war purposes has drawn heavily upon the supply of experienced mill and woods men, and to-day the lumber manufacturers and loggers have to depend almost entirely upon foreign labor of various types for their labor supply.

The demand for lumber at present is fair, the volume of business having slackened during the past months or so, and prices are nearing a point where lumber manufacturers can hope to make some re-

turn on their investment. The improvement in the price is the result of the equalization of supply and demand, a condition which it will be necessary to maintain if the lumber industry is to be placed on a stable basis. The changed conditions with regard to the market have been brought about by reduction in supply, caused by the fact that continued selling of their product below the cost of production forced a large number of British Columbia mills to cease operations, and stocks were thrown on the market and disposed of at any price that could be obtained. In this way surplus stocks throughout the province have been gradually worked off during the past two years, the brisk demand of the fall of 1915 having hastened the cleaning up of practically all old stocks. The demand for lumber continued to be fairly good and a number of mills which had been idle for several years commenced operations again. There are, however, a considerable number of plans which, for financial reasons, have not resumed operations, and this fact, together with the fact that stocks had been greatly reduced, resulted in a great reduction in the supply which had the effect of strengthening the market.

At no time during past years have British Columbia mills worked to full capacity. Even in the years 1911 to 1913, when production was at its height, few of the mills were obliged to operate more than one shift. The demand at the present time is chiefly for material required in the rural districts of the prairie provinces, there being little demand for city building, which latter class of trade represented the greatest portion of the 1911-13 demand, so that, so far as the interior mills are concerned, we cannot look forward to a demand in the immediate future equal to that of the period last referred to. The improvement in the demand for B. C. lumber products from eastern Canada and increased activity in the export trade, etc., will absorb a considerable amount of B. C. lumber, but the present producing capacity of B. C. mills is more than sufficient to care for all demands that may be anticipated for some time to come.

Indications at present are that there will be an increase in lumber production throughout the province as compared with last year. This, however, will be regulated almost entirely by the labor situation, and also by the supply of cars and the orders available. Operations at present are seriously hampered through lack of sufficient labor, and there is no indication of any improvement. Shortage of cars has also hampered operations and will no doubt continue to do so, particularly during the months when the grain crop is moving. Interior mills depend entirely on the prairie provinces for a market, hence the crop situation is of vital importance. The outlook at present for a good harvest is promising, and mills look forward to a good demand during the balance of the year. Old orders are being gradually cleaned up and stocks are increasing. Interior mills, as a whole, will be in a position to handle all normal requirements.

In considering the present situation and the outlook, it should be borne in mind that the capacity of B. C. mills in normal times is greater than the normal demand of our present markets. This condition results in surplus stocks and an unstable market. The present abnormal prices, while not unduly high from the standpoint of reasonable returns to the producer, are an incentive to even greater than normal production. Hence wider markets in order to absorb the surplus of B. C. lumber must be secured to equalize supply and demand, if the lumber industry is to be placed and maintained on a permanent and stable basis.

Proper Cost Accounting Ensures Success

Production of Mill Work Requires Accurate Knowledge of Cost of Materials and Operations—Co-operative Methods Make Safe Results Possible

IF you ask any successful manufacturer of millwork, or sash and doors, what is the most important portion of his business, he will, in the majority of cases, tell you that it is the work of cost accounting. You might be inclined to think that getting orders was more important than finding out how much to charge for the goods, but it is not so, and many a man has found this out to his sorrow when it was too late. To-day, although nearly every manufacturer will admit the truth of this, it is surprising how many will balk at the proposition to install a modern cost accounting system. Those who have been getting along in the old, haphazard manner—imagining that they know quite enough to charge a good price for their products—are hard to convince that they would be better off if they devoted more of their time and money to bringing their cost system up to date. These same manufacturers are a millstone around the necks of those who have seen the light and who are charging real prices for their products. They make it possible for the bargain hunter to infest the millwork business, just as he infests other lines of trade. They take the profit out of a great deal of the lumber and millwork business, and are to blame for many of the failures that occur.

Probably we never will see the day when there are none of these men in any line of business, but it is to be hoped that in the production of millwork a better time is not far ahead, when there will be a considerable number of firms in each locality who have found out how to estimate the costs of their finished product, who have the backbone to insist upon getting the price, and who supplement this by turning down all the trade which cannot be obtained without cutting the price below the deadline. To-day the vast quantity of business that is done at this low level is responsible for frequent business disasters. This class of trade takes all the pleasure out of business; it keeps down wages as well as profits, and it increases a line of building activity that is risky to all parties concerned, from the lumberman to the purchaser of the finished building, with the possible exception of the contractor himself, who generally knows how to clear out of the danger zone and leave his business victims in the lurch.

Cost Accounting a Business Proposition

Now, all that has been said above is so well known to most men in the business that it would scarcely be worth while putting it into print or even discussing, if it were not that so many men who admit it are themselves guilty, not being willing to consider the installation of a modern cost accounting system in their own business. The objections raised are generally of one or two varieties. Ignorance makes cowards of some of them, and they falter before the imaginary difficulties of making the change, or they have an idea that the cost of making the change is too great. In other words, they think that they might as well go ahead losing money on much of their trade rather than make an investment in order to avoid such loss altogether in the future. In this way it comes down to a matter of balancing the cost against the present loss and of showing a man that, after an effective system has been installed, his business worries will be so greatly reduced that the trouble and expense involved in making the change are not worth considering.

Not long ago a millwork manufacturer in the United States who was carrying on a large business convinced himself that there ought to be some way of getting at his cost accurately enough to enable him to deal intelligently with customers who expected to get his goods so cheaply that there would be nothing in it for him. He knew that in the past many a customer had been getting the best of him, but he was at a loss how to go about cutting off this line of business. A study of the cost accounting situation, however, finally showed him that the key to the situation was to be found therein. How to get at the cost of any given article in any given quantity was the real problem. With this information he saw that he would be able to separate easily the sheep from the goats among his customers. Moreover, he saw that he would be able not only to revolutionize his own profit showing, but to help his competitors to do the same thing. Once he brought the consideration of his competitors into the problem he found that he was proceeding along a road that led definitely to results. He saw that the best way to solve such an important problem was to talk it over with other men in the same business. This he did, and he learned that others had been in the field ahead of him. A few years previously a number of millwork manufacturers had talked the matter over together and had formed a bureau for the interchange of information regarding costs, and this bureau, a pioneer in its work, is to-day distributing its benefits over a wide field. The bureau has developed a cost accounting system which is practical and easy to understand, and which is based upon the combined experience of those who become members. It is known as the Millwork Cost Information Bureau, of Chicago, but it has members in many parts of the United States and also in Canada, all of whom are continually making fresh tests and contributing information upon which the system is based and kept up-to-date.

A Practical Co-operative Plan

The manufacturer referred to above took his troubles to this bureau. At first he felt somewhat skeptical, not believing that he could ever get, as a selling price even, the cost prices contained in their schedule, the majority of which seemed to him to be much too high. The expense of installing the system, however, was not great, and he tried it out. To-day he is a convert to modern cost accounting methods, and there are many others in the same class. We are not seeking

to advertise this bureau in any way. We simply realize that they have developed a good system which is based upon a logical business principle, and that such a system, or any other one, similarly conceived and carried out, would be a good thing for any millwork plant to install. It enables them to cut out all the unprofitable business and to price their open orders in a manner that is fair to themselves and to the trade in general. The very first effect of making the change and trying it out is to give the manufacturer confidence enough to ask a fair price and to give it. He finds out immediately that in many cases competition upon a "big bill" is not so keen as he had expected, and that on other bills, no matter how low he may figure, he cannot get the business. Armed with the information obtained in this way by co-operation, a manufacturer will not hesitate to ask a profit on his entire output and to pass up all business that would show a loss. Writing about the matter, a certain mill man says: "We are convinced that cost knowledge is necessary if we are to get a profit on our entire product. If the lumberman was in a position to know his costs there would be a much smaller proportion of his output sold below the deadline, and the millwork business would show a return more in keeping with the time, energy, and money invested." It stands to reason that only something that is nearly perfect in the way of cost accounting would invoke such a statement from the keen business man.

Scientific Accuracy Possible

The object of this article is simply to impress readers with the fact that there is hope for everyone in the millwork business who is weighed down by the dead weight of not knowing how much to charge for his product. Most of the trouble in connection with the lumber business, from the woods to the retail yard, is caused by not knowing how to ask and to insist upon a profit, and the best way to get over the difficulty is to co-operate with other men in the same line of business. Retailers have been showing the way in this direction of late. Their object was not so much to get better prices as to associate with one another in promoting their mutual intesests of various kinds. Association taught them that competition is not the life of trade, but rather that co-operation is the real motive force that makes trade both active and profitable.

There are not many institutions devoted to the systematizing of millwork cost accounting, and therefore in putting this matter forward we are obliged to use one institution as a chief example. What they have done, however, can be done elsewhere, and we believe that the principles of their system are so sound that they can be applied to the industries in Canada with equally good results. There are many large millwork producing firms in Canada and the United States which have worked out their cost accounting methods so scientifically and successfully that they are in a class by themselves. Even they, however, can benefit by a consideration of this question. The great majority of other firms in Canada who have not given this matter the study it requires ought to take the subject up seriously and seek to co-operate, with the object in view of developing a systematic cost accounting standard.

One Canadian firm which has worked out this cost accounting in accordance with the methods of the Millwork Cost Information Bureau—the Georgian Bay Shook Mills, Ltd., in a letter to the Canada Lumberman, say: "We believe the day has come when woodworkers will no longer be satisfied to quote blindly, without any knowledge of the cost of what they are producing. Where the margins have always been small, as in our lines, and where the cost of raw materials and labor have advanced to such an extent, it is nothing short of business suicide for any firm to endeavor to fix a price on an article without knowing in detail the cost of producing such article. There never was a time like the present for every firm to establish a scientific and accurate method for finding its costs. It makes better competitors of us all and teaches us to know our business." They add, by way of explaining their adoption of this particular system, that the ideas involved in it are "those of practical planing mill men who have made a long study of scientific cost methods and cost accounting, and in this way have a great advantage over other cost systems that may be installed, where a knowledge of the detail of the woodworking business is lacking."

Ignorance of Costs Invites Disaster

The Canada Lumberman would not be inclined to put this matter so forcibly before its readers were it not for the fact that of late years, at meetings of lumbermen and in private discussions with members of the trade, this one fact has been borne home to us more definitely and impressively than anything else, namely, that in the millwork business and in the retail lumber business nearly all the disasters reported are the result of ignorance about costs. This ignorance is admitted by many firms and individuals who confess their inability to handle the problem. They imagine that they are in the hands of a business system—if it can be called a system—which they have inherited and from which they have no power to escape. So long as they feel this way they will have to continue in the old method of doing business, competing bitterly for trade which is not worth obtaining and cutting one another's prices on business which one of them might just as well have had at a fair profit. There is nothing quite so foolish as to spend one's life in a vain effort to make a living by such practice when, by making use of the experience and opinions of others, who are willing to reciprocate, it is possible to free oneself from these inherent evils.

There is nothing more impressive about business conditions in general to-day than the fact that the appreciation of these ideas is responsible for much of the success that has been achieved in almost every line of trade. Knowing one's costs and getting them, together with a profit, in the price asked, is the basis, and the only basis, of successful trade. Even the departmental store and the mail order business, which at first glance seem to be cut-price sinners of the blackest dye, base their operations upon the fact that they know the cost of everything they sell, not simply the cost to them, but the cost when the goods arrive at the customer's front door, and that they average their profits and losses on an enormous turnover so skillfully that the balance swings heavily to the profit side. They are pastmasters in the art of cost figuring, and thus are able to present to the public bargains and expensive goods so well mixed that they are certain to get a profit year in and year out.

Why should not the millwork business be based upon a similar knowledge of cost details? It has been proved that this is possible, and the sooner the day arrives when the majority of millwork manufacturers are doing business in this way the better it will be, not only for themselves, but, in fact, also for the consumer.

Montreal Retailers Interested in Association

On July 19 an informal meeting of several prominent Montreal retail lumbermen was held at the Board of Trade, to consider a suggestion for the forming of a retail association. A communication from the secretary of the Toronto Lumbermen's Credit Bureau, Incorporated, was read, describing the methods and aims of that institution. The discussion generally was along the lines of the need for educating retailers as to co-operation. Montreal, it was pointed out, greatly needed an association, the retailers being practically the only unorganized industry in the city. Such an association would benefit the entire industry, and would undoubtedly tend in the direction of preventing unfair competition, which injured retailers. The present time, it was also stated, was particularly opportune for organizing an association, having regard to questions which would inevitably have to be faced when the war was over. Now was the time to prepare for such events. Even to-day there were several makers which could with advantage be dealt with, especially as to quotations, credit, etc. It was decided to hold another meeting in the near future.

The holding of the above meeting was the result of some of the prominent retailers in Montreal taking an interest in the movement in Ontario and canvassing their fellow retailers. On the whole, the opinions expressed favored a general discussion of the subject. Some objectors were met with who thought that little or nothing could be accomplished through the medium of associations, and that we were all depending too much upon them to do work which could be more adequately done by individuals.

Men with such ideas are fortunately in the minority. They do not grasp the underlying spirit of co-operation. Most people recognize that combined effort is the most potent influence in trade, politics, religion, etc., and that it is only when pressure is exerted through the medium of men acting in unison that the maximum benefits are obtained. The real trouble in the past has been too much individual effort in the retail lumber trade—that each man has gone his own way, regardless of what his fellow retailers were doing, and that distrust and jealousy have been the outcome, to say nothing of the monetary losses, due to the want of co-operative effort in the way of checking undue credit.

Retail lumbermen have their own troubles and difficulties, they are interested in questions affecting the well-being of the industry, and unless there is concerted action—or at any rate a method by which the interests can be protected—the general interests are likely to be prejudiciously affected. If the retailers will not look after their own problems, they will inevitably be the losers.

Many Montreal retailers take the view that the formation of an association is at least worthy of consideration. They recognize the value of the "get together" idea, and it is likely that something definite will be done.

Montreal has peculiar conditions to meet in forming a retail association. Leaving out of consideration the bilingual question, a rock on which some associations have split—there is a certain amount of feeling over the failure of a previous retail lumber association, due to causes which need not be discussed. These are obstacles that can be overcome, provided there is a spirit of give and take. Practically all retail lumbermen spoken to on the subject admit the advantages of such an association—they are too obvious to be ignored. It has been pointed out that, to obtain the utmost benefits from this

co-operative effort, it is necessary that there be mutual trust, as without such a condition the formation of an association will be in vain. Members of a retail association are often competitors for the business that is going, and while it is impossible for them to combine for price regulation, there are many subjects on which they can get together to better conditions which have no direct connection with prices. These conditions have already been outlined in the Canada Lumberman, and the fact that similar associations in Canada and the United States are working satisfactorily is sufficient proof that, operated on the right lines and in the right spirit, there is a distinct field for them.

Without organization, the retail lumber trade cannot expect successfully to fight for its protection. In Montreal, the wholesalers are able, through the Board of Trade, to look after such questions as demurrage and freights, and a retailers' association could, in some instances, work in harmony with the wholesalers, thus adding to the effectiveness of any action.

Pulpwood Production and Consumption

Steady Growth of Pulp and Paper Industry in Canada Continued During 1916—Statistics of Exports of Wood and Pulp

The report of the Forestry Branch of the Department of the Interior upon pulpwood production and consumption in Canada, will be published in the near future. It will contain an interesting review of the industry, including the following figures and comments:—

The steady growth of the pulp and paper industry in Canada, practically since its inception was continued in 1916. Forty-nine firms reported their mills as active in 1916 as compared with 50 firms in 1915, but the total consumption of pulpwood and total value of the wood used rose much above the preceding year. These facts are brought out in the figures below.

Year	Total Consumption	Total Value
1908	482,777 Cords	$ 2,931,653
1909	622,129 "	3,464,080
1910	598,487 "	3,585,154
1911	672,288 "	4,338,024
1912	866,042 "	5,215,582
1913	1,109,034 "	7,243,368
1914	1,224,376 "	8,089,868
1915	1,405,836 "	9,426,217
1916	1,764,912 "	13,104,458

Of the five provinces engaged in this industry three greatly increased their production and two fell behind last year. Those which increased in production were Quebec, Ontario, and British Columbia, and those which showed decreases were New Brunswick and Nova Scotia. This change brings British Columbia back into third place which it occupied in 1914.

Pulpwood 1915 and 1916 by Provinces

Provinces	Quantity 1915 Cords	Quantity 1916 Cords	Total value 1916	Average value per cord 1915	Average value per cord 1916
Total, All Provinces	**1,405,836**	**1,764,912**	**$13,104,458**	**$6.71**	**$7.42**
Quebec	697,962	924,272	6,840,489	6.06	7.40
Ontario	480,627	637,612	5,016,425	7.92	7.87
British Columbia	90,535	108,997	579,799	6.08	5.32
New Brunswick	115,842	79,594	591,705	6.32	7.43
Nova Scotia	20,870	14,437	76,040	4.75	5.27

The Canadian pulp mills in 1916 consumed for the manufacture of pulp in Canada 1,764,912 cords valued at $13,104,458; while 1,068,207 cords valued at $6,866,669 were exported, making a total production of 1,068,207 cords valued at $19,971,127. This represents an increase of 25.5 per cent. in pulpwood production and 28.1 per cent. in total value as compared with 1915.

This great increase is due to the tremendous demand for pulp and paper caused by the war conditions of the preceding two years.

The average value of pulpwood at the mill increased 71 cents per cord over that of 1915. All the provinces show increases in the value of pulpwood except Ontario and British Columbia.

Production by Kinds of Wood

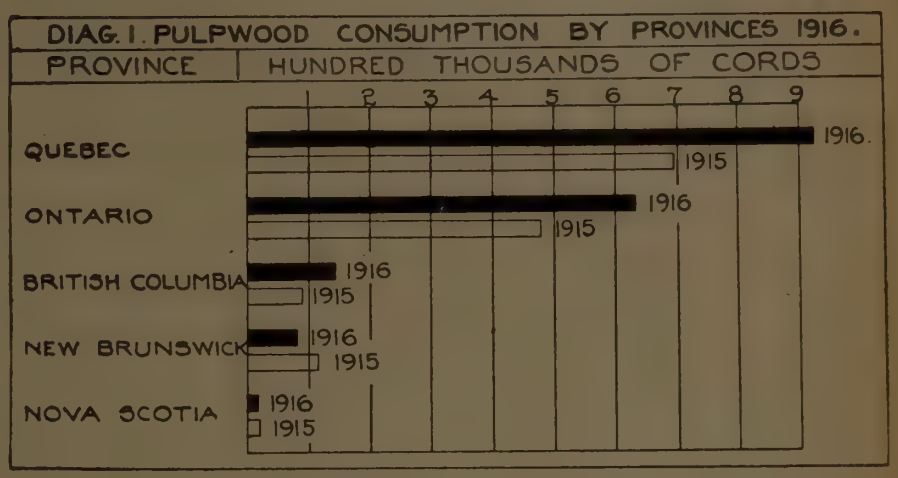
The production by kinds of wood in 1916 and 1915 was as follows:

Kinds of wood	Quantity 1915 Cords	Quantity 1916 Cords	Total value 1916	Average value per cord 1915	Average value per cord 1916
Total	**1,405,836**	**1,764,912**	**$13,104,458**	**$6.71**	**$7.42**
Spruce	998,156	1,203,557	9,219,414	7.07	7.66
Balsam Fir	307,219	433,154	3,167,311	5.84	7.31
Hemlock	55,265	82,307	483,633	5.89	5.88
Jack Pine	41,953	39,717	192,405	5.37	4.84
Poplar	3,243	6,177	41,695	6.94	6.75

The consumption of pulpwood by provinces in 1916 and 1915 is shown in the following diagram:—

Increase in Chemical Process Production

In regard to the process by which the wood is converted into pulp it is to be noted that while the mechanical, or ground-wood, process was the single process most largely used, the three chemical processes, for the first time in Canada, together consumed more wood than the mechanical, the totals being: chemical processes 937,654 cords



and mechanical process 827,258 cords. While a slight increase was made by the soda process and a considerable increase by the sulphite process, the notable change during the year was the increase made by the sulphite process from 470,949 cords in 1915 to 727,945 cords in 1916. An increased quantity of wood was converted into pulp by each of the four processes.

Approximately 1,296,084 tons of air-dry pulp were made in Canada in 1916. This is on the basis that one cord of wood produces one ton of ground-wood pulp or one-half ton of chemical fibre. This is a total increase of 20.6 per cent. over 1915. The increases shown by the different processes were: ground-wood pulp, 11,2 per cent.; sulphite process, 54.6 per cent.; sulphate process, 9.3 per cent.; and soda process, 23.1 per cent.

Spruce and balsam fir are used in all provinces and in all processes. Hemlock and poplar are not reported from New Brunswick and Nova Scotia. Jack pine was used only in Ontario and Quebec and most of it was used in the sulphate process.

Canadian Wood Pulp Production Gaining

The quantity of pulpwood manufactured into pulp in Canada has been steadily gaining on the amount of wood exported to other countries in the unmanufactured state. In 1908, 482,777 cords were manufactured into pulp in Canada, and 794,896 cords were exported in the raw state. In 1912 the figures were: manufactured in Canada, 866,042; exported in the raw state, 980,868. The dividing line was crossed in the year 1913, since which time the quantity manufactured in Canada has exceeded that exported. In 1915, 1,405,836 cords were manufactured in Canada and 949,714 were exported in the raw state. In 1916 these figures had risen to: manufactured in Canada, 1,764,912 cords; exported in the raw state 1,068,207 cords, showing that 696,705 cords more were manufactured into pulp in Canada than were exported in the raw state to be manufactured abroad.

The exports of wood-pulp from Canada show alternate increases and decreases practically every year from 1909 to 1916. The total export in 1915 decreased 14.3 per cent. while in 1916 it showed the remarkable increase of 53.4 per cent.

The alternate rise and fall of wood-pulp exports is shown in the following figures:

Wood-Pulp Exported—1908-1916

Year	Tons	Value
1908	233,505	$ 4,070,928
1909	280,744	4,898,842
1910	328,977	5,694,896
1911	259,514	4,902,862
1912	348,100	5,952,361
1913	298,169	5,913,560
1914	424,883	8,865,436
1915	364,170	9,279,414
1916	558,890	17,344,342

Trucks, Tractors and Trailers for the Lumber Trade

Motor Haulage Revolutionizing Delivery Problem

MOTOR trucks have come into such general use in retail lumber yards that they are to-day recognized as an ideal method of hauling, in the majority of cases. When first introduced this method of delivery had limitations which have since been overcome, so that to-day, with the motor and the various types of trailers, together with special loading devices for getting the load on and off the truck with the least possible delay, this method of delivery has become of great service to the trade. The motor truck is a wonderful efficiency stimulator. The economies which it introduces in connection with hauling costs arouse its owner to seek ways and means of getting the maximum amount of service from it. This fact, and the fact that a motor truck is able to do a great amount of hauling in a short space of time have led to the use of trailers and moveable platforms which make it possible to keep the trucks or tractors on the go all the time. With the greater carrying capacity and speedier delivery rendered possible by the use of trucks, the market of any retail lumber dealer is greatly enlarged. The accompanying diagram, kindly furnished by the Chicago Pneumatic Tool Company, is a striking illustration of how this works out, making it possible for the dealer to obtain trade in a vastly wider area of country than when his deliveries are made by horse and wagon.

One of the largest firms of retail lumber dealers in Toronto, who use three motor trucks in their delivery service and are greatly pleased with the results secured, state that an important feature in connection with such trucks is that the seat for the driver should be placed over the engine, which permits them to load longer material than on an ordinary truck where the driver's seat is several feet behind the engine. One of this firm's trucks is 2-ton capacity and is used for delivering the lighter loads, also for sash, doors, etc. This truck has travelled in the neighborhood of sixty thousand miles and has caused very little trouble. During five and a quarter years' use, the total repairs upon it, exclusive of tires, have cost $509.32.

The other two trucks used by this firm are of 5-ton capacity and the bodies are constructed so as to dump the loads, in the same manner as the ordinary roller wagon. One of these trucks has a body longer than the other, so as to facilitate the delivery of longer timbers and joisting without a trailer. When this firm has particularly long timbers to deliver, it makes use of a 2-wheel trailer with wheels 60 in. x 6 in., and strongly built, so as to be quite good for any load from five to ten tons. This trailer is also built so that the load may be rolled off in the same manner as with the two trucks referred to above. The repairs on these two trucks for a period of about four and a half years, exclusive of tires, have cost $1,361.87.

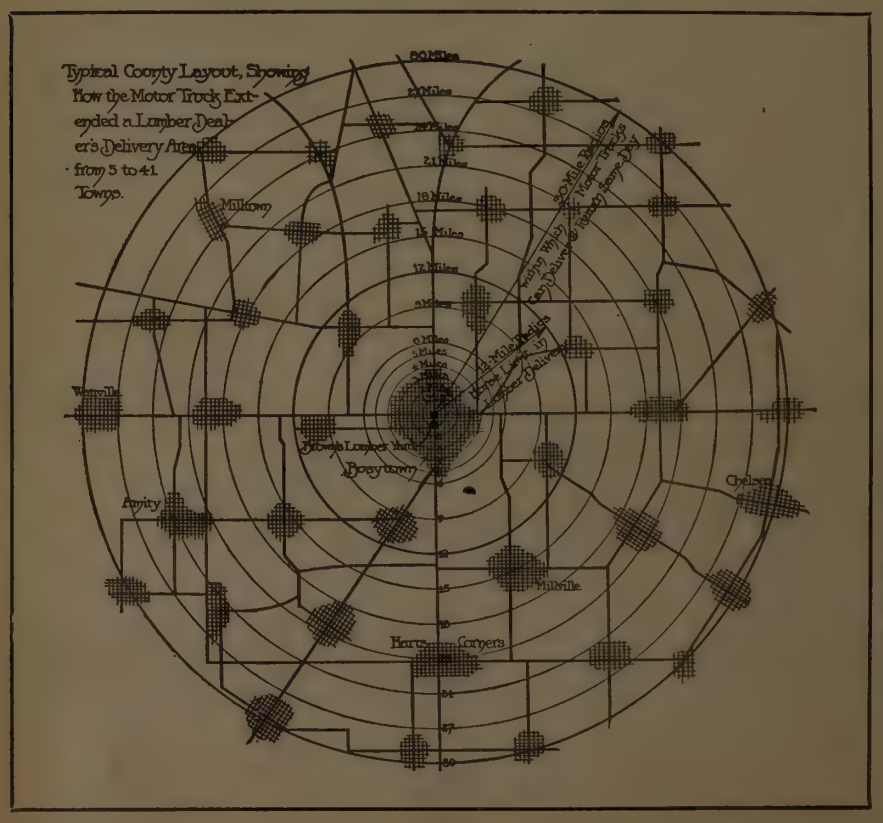
Referring to the operation of these trucks, the firm say that "so long as the roads are good and hard they are most satisfactory, but trucks are simply useless when there is not a good bottom to the road, and truck users should not attempt to use heavy loads unless there is a really good road to the point of delivery. Otherwise the truck may be injured more in getting into a hole and attempting to get out of it, than it would be in several months of ordinary use."

Since beginning to use trucks, the firm state that the wages of drivers have advanced about 50 per cent., chiefly on account of the war. The cost of tires, they find, is the big expense, and since using these three trucks they have paid $3,835.87 for their tires.

An old lumber wagon equipped with four steel rollers and used as a portable loader.

The point to which they refer emphatically is the importance of having a truck with the best quality and type of springs. Comparing their trucks with those of another firm which also operates three trucks, they state that they found the others were paying out considerably more money for springs. As yet, this firm has not had to renew one leaf of any spring on its trucks. Proper attention to the carburetor, they also state is of great importance. When the carburetor is working properly they obtain between four and five miles to the gallon of gasoline on a 5-ton truck, and between seven and nine miles to the gallon on a 2-ton truck.

A typical instance of the work done by motor trucks in delivering lumber is afforded by the case of the "Little Giant" motor truck, manufactured by the Chicago Pneumatic Tool Company, Chicago, and the Canadian Pneumatic Tool Company, Limited, 379 Craig Street West, Montreal, who have offices also at 107 Church Street, Toronto, and at Hamilton and Vancouver. This firm is mentioned in particular because its trucks are widely used and afford a good example of the general principles of motor truck haulage for lumber yards. One of the accompanying illustration shows a rear view of a motor truck equipped with five steel rollers, which make it possible to load and unload rapidly. Another illustration represents an old lumber wagon which has been equipped with four steel rollers so that it can be used as a portable loader. This wagon is drawn about the yard to receive its load and when the truck returns empty from making a delivery, the load is quickly rolled upon it and it starts upon a new delivery



Rear view of motor truck equipped with five steel rollers—Illustration furnished by Chicago Pneumatic Tool Company.

trip. Other methods have been adopted by different companies for putting a load upon a truck or trailer without delay, and for unloading quickly at the point of delivery. While these vary considerably in detail, the principle is much the same in regard to all of them, being governed entirely by the desire to save time and get the utmost possible amount of service out of the truck or tractor.

Huge U. S. Government Order for Motor Trucks

The letting of the largest motor truck order ever given by the United States army, totalling $33,179,026, which was announced recently, is of great interest to the lumber trade on account of the tremendous volume of lumber that will be required to manufacture the trucks. In anticipation of the business, inquiries have been out for several days, indicating that at least 25,000,000 feet of lumber will be required in making the bodies of the trucks. In addition a large volume of hardwoods will be purchased for the manufacture of wheels. These inquiries were placed in circulation by many of the eighty-one manufacturers who bid for the business, knowing beforehand what the government requirements would be. Orders went to six of the concerns that bid for the government business. The awards were as follows:

Four Wheel Drive Company, 3,750 three-ton chassis at $3,248 each, to be delivered at the rate of 175 a month.

Packard Motor Car Company, 1,500 three-ton chassis at $3,197 each, delivery 500 a month, starting in October; 300 three-ton chassis at $2,804 each, delivery 100 in August and 200 in September.

Locomobile Company (Riker truck), 400 three-ton chassis at $4,225 each, delivery 125 a month, beginning in October.

Nash Motors Company (Jeffery truck), 3,000 one and one-half ton chassis at $2,805 each, delivery by July 1, 1918.

Garford Motor Truck Co., 900 one and one-half ton chassis at $2,730 each, all delivered by the end of December.

Pierce-Arrow Motor Car Company, 800 one and one-half ton chassis at $3,500 each.

Through the terms of the contract 10,650 machines will be delivered before July 1, 1918, but the bulk of the huge order will be delivered before December 1, this year, if the manufacturers are able to make good their promise to the War Department.

Increasing the Efficiency of Motor Truck Delivery

The greatest economy that the motor truck has effected in the lumber field is in the improved methods of loading and unloading that its use affords. The day of holding up hauling units while each piece of lumber is individually loaded and unloaded has largely passed for many dealers, and in its stead methods have been adopted which permit the taking on and off of a whole load at one operation.

Many companies are now using trailers in conjunction with their motor trucks, in order that the trucks may be constantly on the move. Two or more trailers are operated with each truck, which permits the loading and unloading of the trailer while the truck is busy on another trip. The four-wheel type and the two-wheeler of the semi-trailer type are both used, with the latter predominating.

But the most general saving that has been realized with the motor truck is by use of the roller platform body, and roller loaders. A great many of the largest dealers in Canada and the United States are now using this equipment with very successful results.

The W. F. Hurd Lumber Company, of Detroit, Michigan, have their mills and yards equipped with trestles just the height of the platforms of their trucks. The trestles have channel tracks on which stake-aided platforms are moved about gathering up the load. The completed load is rolled to the edge of the trestle, one of their motor trucks is backed up to it, and platform and load complete are rolled on to the truck.

Melvin Savage, hauling contractor for the Christenson Lumber Company, of San Francisco, California, has speeded up delivery by equipping all the old lumber wagons of the Christenson Company, which were discarded when the present fleet of Packard trucks were installed, with rollers. These are moved about the yards gathering loads, and a full load is rolled on to the truck by the driver alone in three minutes, by means of a hand winch on the wagon rollers. The platform of the truck is also equipped with rollers. When the destination of the lumber is reached, the whole load is rolled off as easily as a single stick by means of a hand winch on the truck. Unloading in this way takes only three minutes.

A type of body from which the load is rolled by gravity is used on the Packard truck owned by the P. S. Huckins Lumber Company, of Boston, Massachusetts. This is a roller type body with the front roller mounted considerably above the rear one, and as soon as the load is unfastened it rolls from the truck by its own weight. Green and Wood, of New Bedford, Massachusetts, operate a similarly equipped Packard truck and also a trailer with the body designed and fitted in this manner.

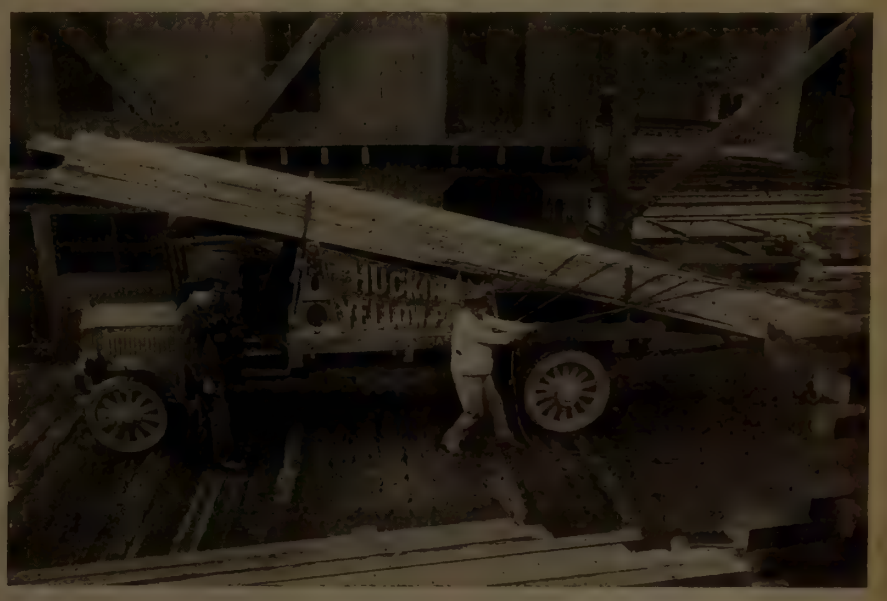
Without taking any of these special loading and unloading methods into consideration, a comparison of the cost of hose and motor truck delivery in the lumber field shows that the motor truck is by far the more economical transportation unit. Before standardizing on Packard trucks, the Mills-Carleton Lumber Company, of Cleveland, Ohio, made a careful comparison of the performance of a Packard four-tonner and a team of horses for a single day. The team of horses travelled nine miles and delivered 6,425 thousand board feet of lumber, while the truck traveled 36 miles and delivered 15,132 thousand board feet. Compiling this in thousand-board-feet-miles, it was found that the horses had accomplished 28,868 thousand-board-feet-miles, while the truck had reached 137,240 thousand-board-feet-miles. The truck did four and three-quarters times as much work as the team of horses.

Speeding Up Lumber Deliveries

Keeping material moving is one of the largest factors in profit-making in the lumber business. A rather unique system of loading has been devised by the A. W. Burritt Company, of Bridgeport, Conn., in connection with their trucks furnished by the Federal Motor Truck Company, of Detroit, Mich. Singular to say, a one-horse wagon is a great aid to the fast hauling of lumber with this motor truck. A special transferable body has been made by the Burritt Company. This is interchangeable from a one-horse wagon to the Federal truck. The horse-drawn wagon is used in the yard and not for delivery to customers, the horse-wagon being backed up to or drawn alongside of the lumber pile. Onto it is transferred the lumber, piece by piece, by the men in the yard. When it is loaded the horse draws it to a shed equipped with a chain hoist. The chain is hooked into eyebolts at the four corners and the load is hoisted from the wagon. Then the Federal is backed into the shed and the platform with its load lowered onto the truck.

By working in this manner a great deal of efficiency is developed. In other words, there is no lost time for the truck. It is operated to its fullest capacity and customers are served with a rapidity which

W. F. Hurd Company's method of rolling platform and load on to their 4-ton Packard.



A Packard equipped with a body that unloads itself by gravity.

would be impossible if the truck had to wait for a load to be put on it, one piece at a time.

Figures are given below showing the board measure delivered by the Burritt Company in December, 1915, January and February, 1916, showing a total for these three months of nearly a million feet of lumber. To do this amount of business cost $2,100 to deliver, with a traveled distance of 4,122 miles in and out, at a total cost of but $2.18 per thousand feet.

This cost includes every operation from the stock in the storage piles until it is placed in the hands of the customer.

The table below shows the board measure, miles traveled and the customers served:

December 1915 Board Measure Feet	January 1916 Board Measure Feet	February 1916 Board Measure Feet
186,614	156,450	135,752
202,123	180,570	100,182
388,737	337,020	235,934
Miles	Miles	Miles
792	711	550
632	714	723
1424	1425	1273
Customers Served—		
153	125	99
169	135	131
322	260	230

962,691 feet delivery.

Cost $2,100, 4,122 miles in and out.

Average cost per M. ft. delivered. Stock taken from storage piles and delivered to customers. All cost figures except office work—$2.18.

Since April 1 they have had three 1½-ton Federals in operation on this type of work. (16 feet and under—small order). Longest haul in the three months—20 miles round trip. Most trips are about 2 to 2½ miles away; 4 to 5 miles round trip.

The Company's Crew Cost is as Follows:

	Cost Per Month 25 days
1 Horse (1 single reach wagon)	
1 Driver at .40 per hour	$100.00
1 Foreman to handle orders at $15 per week	62.50
2 Good laborers at $13 per week	108.34
5 Platforms at .50 per week	10.42
2 1½-ton Federals at $8.25 per day	412.50
2 Sets chain hoists at .75 per week	6.25
Total	$700.01

This crew can load for three trucks. The cost of delivery here includes the cost of the one-horse wagon, its driver, a foreman to handle orders, two laborers, five sets of platforms in operation on the two 1½-ton Federals and the two sets of chain hoists. No item, therefore, has been left out which enters into the expense of delivery.

This may give other lumber firms an insight into the proper method of figuring complete costs.

Use of Motor Trucks in the Lumber Industry

By R. G. Enell

Truckage is one of the big factors in the lumber business and is not a simple matter, for loads are bulky, a mixed load is the rule, and to pay profits the loads must be large. Old methods encouraged delay and to maintain any sort of a delivery system it was necessary to have branch yards. I have known of dealers having five yards who, after motorizing, have cut this number down to two. This item alone shows the efficiency of motor trucks. Lumber dealers with trucks are now able to cover wider distances; the many loading devices have speeded up deliveries still further and it is now possible to make one truck do the work of several teams and do it more promptly and economically.

We find many different types of hauling confronting us, as each division of the industry has its haulage problem peculiar to that branch and must be considered separately; nevertheless, you will find wherever a lumberman has put a truck into service he does not go back to horse-drawn equipment, but becomes a truck enthusiast. The time is near at hand when practically all lumber in any form will be moved with motor trucks, as every man engaged in any branch of the lumber industry is naturally desirous of handling his transportation as efficiently and economically as possible and has studied the various forms of transportation. As a result of these investigations the lumberman, especially the retail merchant, is doing away with the horse-drawn equipment and adopting motor trucks. The progress which the motor truck has made in the retail lumber field is partly to be credited to paved streets, while the condition of the country roads has to a certain extent hindered progress in the camp and mill. Nevertheless, the motor truck is rapidly becoming a factor in the rural lumber district. The truck manufacturer realizes the situation and is to-day studying the requirements of the lumber dealer with unusual care.

There are many different problems in connection with lumber delivery trucks which must be taken into consideration; size, length of bodies or platforms, length of wheel base, load capacity, facilities for loading and unloading, and the question of efficiency of tractors and trailers. In some cases a heavy truck is the most adaptable, while in others a light truck may be used to better advantage. In making long hauls with heavy loads, for example, from mill to retail dealer, from retail dealer to large contractor, for suburban haulage, the heavy truck in capacities from 3½ to 5 tons, has proved much more efficient and economical.

On the other hand, the retail lumber dealer has found that in making short hauls to the consumer or to the sash and door builder, where quick delivery is necessary, the light truck with a capacity from one to two tons has proved more efficient.

If a customer calls a retail lumberman on the phone and requests him to rush an order for a few feet of finishing lumber or a few more bundles of shingles, he naturally wishes to oblige his customer and this is one of the many places where a motor truck proves efficient in short hauls. This order can be filled and delivered and the truck will have returned before the horse drawn vehicle is fairly under way.

There is also the important question of loading and unloading. Many lumbermen have devised means of their own which have shown a saving in both time and money in this operation. The motor truck manufacturers are also furnishing modern and improved equipment for hauling lumber. Truck chassis are now being equipped with rollers set in roller bearings and the yard wagon is also similarly equipped, and the load is passed or rolled from the wagon to the motor truck very quickly. These chassis and yard wagons are equipped to prevent the load from slipping when under way and the load is transferred to the truck by turning a crank which controls the rollers, this operation being easily handled by one man. With this system no time is lost with the truck, as when it returns from a trip the yard wagon is ready to transfer another load. Another plan is to use a loading platform equipped with rollers in addition to the yard wagon and the transfer is made without the assistance of the yard wagon directly. Still another efficient method of loading or unloading lumber is by means of double or twin bodies or platforms. With this method one platform is mounted on the yard wagon and loaded while the truck is delivering. The yard wagon is then driven underneath a loading device and by means of a hand-operated hoist is raised a little higher than the level of the truck chassis. When the truck returns it transfers the empty platform to the yard wagon, then backs under the loading device, and the loaded platform is lowered on to the truck and fastened by means of two eye-bolts. When the destination is reached the load is rolled back until it tips to the ground, when the truck drives slowly away dropping the load. This method is used in hauling plain boards, but is not of value in delivering molding, casing, millwork or mixed loads.

The business demand for cheaper transportation has not only evolved the motor truck proper, but several differing forms of the truck unit. One of these forms is known as the semi-trailer. The advantage of the semi-trailer for certain kinds of work is very noticeable, as, for example, a business which ordinarily requires much standing time can profit by this form of delivery because one trailer unit can be loaded while another is out on a delivery route. Two trailers give the best efficiency, one being loaded while the other is being delivered. Breathing spells are unnecessary for the motor truck, and the semi-trailer, particularly in the lumber industry, is an excellent way of reducing standing time. One lumber dealer whom I knew bought a 1½-ton truck using a 14-foot body and with it delivered 131,000 feet of lumber in one month. He subsequently changed his truck into a tractor and used two semi-trailers and by so doing delivered 272,000 feet of lumber, thereby more than doubling the efficiency of his truck.

This use of tractors and trailers has proved very efficient in hauling in different forms, especially with heavy loads ranging from five to fifteen tons, and in hauling logs to the mill. Such tractors and trailers are often equipped with an extension trailer which can be unlocked in the beam connection between the axles and lengthened or shortened to suit the particular requirements, then re-locked. For carrying long logs this trailer has proved particularly efficient.

Of all the various lines studied and analyzed by traffic engineering departments, the lumber industry has probably received the greater attention, due largely to the fact that lumber dealers themselves have

taken exceptional interest in their haulage problems. Careful analyses of all costs have been made; records of motor trucks as compared with horse-drawn equipment made, and in fact everything that a lumber dealer needs to know before he decides upon a motor truck is thus available and ready for his use on application, and I believe that this information will do more than any other argument to influence the prospective purchaser in favor of motor trucks.

Lumbermen are still investigating the efficiency and economy of motor trucks and their experiments are constantly convincing them the time is near when the motor truck and tractor will have solved their transportation problems and the horse-drawn equipment will have become obsolete.

It may be said in conclusion that no single motor truck unit has yet been designed which meets all of the requirements of each lumber dealer's individual demands and that it is only by a careful study of each dealer's problem that an intelligent opinion as to the proper truck in the matter of size and type may be formed. Many of the responsible truck manufacturers maintain a traffic engineering department, whose duty it is to collect, classify and make available for their customers' use, data regarding the adaptability of motor trucks to any given industry. This information is based on actual working results in every line of business, including your own, and will be furnished for your guidance entirely without charge and, unlike most things that cost nothing, is very well worth the serious consideration of lumbermen.

The Pulp Mill's Relation to Lumbering

An Important Factor in Waste Elimination—Utilizing Much of the Woods and Mill Waste of Logging and Sawmilling

By John L. Love

WHEN the late Isaac Watts, hymnologist and divine, composed his well-known metrical assertion about the habits and customs of the "little busy bee" he might very well have added a stanza drawing admiring attention to the wasp. Indeed, the latter could fittingly have had a poem all to itself, seeing that its industry was to lead to a discovery epochal in its results.

With the bee is always associated in our minds the teeming hive of tireless workers, but it is the wasp we have to thank for the establishment of many real "hives of industry" throughout this and other lands. Noticing that the hornet made its paper-like nest from material obtained by boring into the spruce tree, and which it apparently subjected to a semi-digestive process, an observant chemist set about experimenting. The result of his investigations was wood pulp and a new industry of world-wide importance. Once again had nature yielded up one of her simple secrets to be exploited by man in his elaborate and costly fashion. Little by little, however, the elaborate paraphernalia and cost of making wood pulp have been simplified and lessened until to-day the process is probably as uncomplicated as mechanical and chemical skill can make it. That, however, may be a rash statement. Manufacturing processes are as much subject to revolution as monarchies in these times, and to-day's brilliant achievement is apt to pale before to-morrow's startling discovery.

The future of the pulp industry is a subject for the prophets; of more immediate concern is the place of the pulp mill as an eliminator of waste in the lumber business. Many fortunes have been made out of what the other fellow threw away in scratching hard for a living, and it would seem that there is more money in tops and firewood, when they are converted into pulp, than in merchantable lumber.

Logging and Sawmill Waste

Probably no industry sheds so much waste as lumbering. Competent authorities, such as Dr. John S. Bates, head of the Forest Products Laboratories of Canada, estimate the logging waste left in the woods to be about 25 per cent. of the original tree. It is just here that the pulp mill gets in its first good work in its mission of conservation, and that in a double sense. Every lumberman is familiar with the "slash" that marks the trail of the logger through the bush; the tops and branches that are left behind to choke new growth and add to the fire hazard. Where a pulp mill is operated in connection with the sawmill a large proportion of this "slash" is trimmed and sent down the drive with the logs to be made into pulp. Not only is this hitherto absolutely waste material turned into considerably more money value than its bulk in merchantable logs is worth, but the fire risk is reduced considerably.

Waste eradication in the woods is only part of the pulp mill's mission, however. Having accounted for all the tops four inches and up at the narrow end, the mill still has a large field for raw materials to draw upon in the waste from the saws. This waste amounts to about 40 per cent. of the original tree, and only a negligible part of it is used in developing power to operate the plant. A conservative estimate is that the total waste lumber for the pulp mill to work up amounts to between 60 and 70 per cent. of the tree, and of this less than half is available for pulp, but in spite of this margin of quite irreclaimable refuse, the above figures indicate that the pulp mill is doing its bit in the present world-wide campaign to cut out waste, and, incidentally to place the lumber industry on a more stable foundation than its own unaided feet have ever provided, of late years, at any rate.

There is a broad economic aspect to the operations of a pulp mill in addition to that already noted. A mill producing one hundred tons of pulp a day calls for two hundred cords of pulp wood. To provide this raw material requires larger lumbering operations than most concerns cover, and the farmer has to be called in to make good the deficit. Hitherto, clearing his land has been the bane of the farmer's existence, and it has been done largely only as government regulations compelled. Now, under the spur of high and advancing prices for pulpwood, land is being cleared as if by magic, and large sections of the reclaimed surface are being put under crop. The economic aspect of this is obvious. The farmer has more money to spend and industry is benefited right along. To this factor may be added that the pulp

Pulpwood stacking for winter consumption.

Slash left by loggers—Avoided by co-operation between lumber and pulpwood operators.

mill employs proportionately more hands than the manufacture of lumber, the industry it is supposed to supplement.

The Pulp Production Process

Before it is ready to be manufactured into sulphite, the pulpwood must be "rossed" or pealed. As a rule it is purchased in a rossed condition from farmers and jobbers, but when it comes down the drive it has to be cut into lengths of four feet and then peeled. The pulp logs are taken from the water in the same manner as for the sawmill except that they are drawn up horizontally. The chains carry them on to the circular saws and the lengths fall on to a moving platform which carries them either to the barking drums or to the stacker. The latter is a movable elevator whose endless chain stacks the pieces on huge piles which constitute the mill's winter supply of material. Those piles become frozen solid and have to be dynamited and quarried like so much stone.

Pulpwood that is required for immediate use is passed through the barking drum, huge horizontal revolving cylinders fitted with innumerable knife-like strips running their entire length. These cylinders toss and tumble the wood until it passes out, stripped of its bark, into a large tank. From there it is guided and dropped end-on into the slashers, which, in a most expeditious and business-like manner, reduce the shrieking log to chips the size of a man's thumb-nail. As the wood is pulverized it diffuses a most fragrant odor as of pineapple, an odor which is by no means suggestive of the sensation that greets the nose at a later stage of the metamorphosis when chemistry has stepped in to hasten the process of dissolution.

From the slasher house the chips are conveyed to the top of a high structure housing the digesters, and stored in bins until required. From here they are subjected to a cooking process. This cooking, or "digesting," roughly speaking, amounts to the chips being boiled in acid. The operation calls for extreme care, as too much or too little cooking will spoil the entire batch. The time occupied in cooking varies according to the kind of pulp being prepared, but it is seldom less than ten hours. When the batch is sufficiently digested it is run out and put through a straining process that eliminates all knots and woody particles.

The final operation consists of running the pulp over the drying machine. A broad felt web carries the mushy pulp on to the steam-heated cylinders. Up and down, in and out, it passes, from cylinder to cylinder, losing at every foot of the way some more of its moisture until it emerges in one intermediate sheet to be split and gathered into rolls, or cut into squares and packed in bales.

If the product is Kraft pulp it will find its commercial destiny ultimately as wrapping paper; if sulphite, it will pass into the paper mill to appear finally as a sheet of newsprint paper.

Northern B. C. Mills to Have First Monorail System

The coming of December next will likely mark the completion of the new combination spruce, hemlock, and cedar plant being erected at Seal Cove, Prince Rupert, by the Prince Rupert Lumber Company, of which J. S. Emerson, the well-known Vancouver lumberman, is president and principal shareholder. The clearing of the site was commenced late in March, but it was well on in April before Manager E. F. Duby (formerly superintendent of Brunette Sawmills, Ltd., New Westminster), was able to proceed with the foundations, weather conditions being peculiarly unfavorable.

Negotiations for the Seal Cove site—about the only feasible location on the Prince Rupert waterfront for a sawmill proposition of any considerable size—were entered into with the Grand Trunk Pacific Railway authorities about the middle of last year, Mr. Emerson's desire being to have the buildings sheeted over before winter set in. Unlooked-for delays occurred in the framing of a lease satisfactory to both parties, and it was January before matters were finally arranged. The site embraces about eighteen acres of land and water, and includes a small island adjacent to the mainland, which lends itself admirably to the construction plan.

The Sawmill and Its Equipment

The sawmill plant is approximately 50 x 250 feet, two storeys, with heavy timber frame. It will have a double log lift (serving both sawmill and shingle mill), steam stop and loader, Simonson log turner, a 66-inch four block carriage equipped with one of the latest electric-driven power set works, and a 10-foot band mill. The edger, a 10 x 72 inch Pacific Coast type, will be equipped with a mechanical "spotter," which will increase the efficiency and at the same time make the work a great deal lighter for the men operating this machine.

The heavy timbers will be delivered over the main rolls to the timber trimmer (a steam swing-up rig carrying an inserted tooth cut-off saw), thence out the right hand side of the mill to the timber decks. All lumber of smaller dimensions, after passing through the edger, delivers across to the left hand side of the mill and through a 40-foot air-lift trimmer, thence over live rolls to No. 1 sorter, where it is grade-marked, and where all rough lumber orders are taken off the sorter and made into parcels for delivery to storage or the loading platform, as the case may be.

Located on the right hand side of No. 1 sorter are the 10-inch horizontal roller band resaw, pony edger, ready shiplap machine and ready sizer, all served by air-lift jump rolls and transfer chains, and each in turn delivering automatically either back to No. 1 sorter or to No. 2 sorter. The latter parallels No. 1 sorter, but carries the lumber in the opposite direction, delivering to the edge stacks at the charging end of the dry kilns, which are located in direct line with and at some distance in front of the sawmill buildings. All dressed lumber to be air-dried or to be used green is taken off and made into parcel segregations as it passes along No. 2 sorter, the balance going on to the edge stackers, thence to the dry kilns. After being properly kiln-dried the lumber is transferred to the unstacker, which mechanically unloads the kiln cars and elevates the stock to the dry sorter, where it receives the final grading and is collected into units or parcels for shipment or for delivery to the big storage sheds. Four dry kilns will be erected at the start, it being the company's intention to thoroughly dry all grades of lumber turned out.

Monorail and Crane Will Handle Lumber

The handling through the yard will be done by monorail and travelling crane. Extending across the entire plant at right angles to the sorting tables and storage sheds is a 30-foot travelling crane. Running parallel to the sorting tables are the monorails connecting with the crane, which acts as a transfer from one monorail to another. At the extreme western end of the travelling crane track is located a storage shed 85 feet wide by 500 feet long and 40 feet high, and running lengthwise of this shed is a four-track monorail system, carried on beams 40 feet above the floor. Beneath these rails the lumber is stored in original unbroken parcels until it is wanted for shipment, when it is again picked up by the monorail hoist and delivered to the shipping platform. This system affords an expeditious and economical method of handling lumber, and makes possible the storage of a very large quantity on a small ground space. The storage shed is so constructed that it not only affords storage, but also acts as a rapid air drier, the arrangement being such as to accelerate air circulation.

The Shingle Mill and Boiler House

The shingle mill is a building 32 feet wide by 150 feet long, two storeys high, accommodating six machines. It is directly alongside and parallel to the sawmill, with a heavy fire wall between, and the portion of the mills occupied by the log decks are served by one roof, the balance of the buildings being under separate covers. The logs are raised to the mill deck by a log lift and then rolled into a short trough, to be fed to an 86-inch cut-off saw. The mills are so arranged that while they are apparently built together as one unit yet each may be operated entirely independent of the other.

The boiler house is of crib construction, and will contain four 72-inch x 18-foot boilers carrying 160 pounds pressure, supplying steam to the big 750 h.p. twin engine, which will operate the sawmill proper, and to the 225 h.p. twin engine which will be used to drive the shingle mill. The roller band resaw, planers, sorting works, and all other outlying drives are individual or groups, driven by electric motors, as the relative locations of the machines may require, electrical energy being supplied by the city of Prince Rupert at extremely favorable rates. Another feature in connection with the steam plant is the fuel storage bin, which is located near the boiler house. Into this bin all sawdust and planer shavings are delivered, the fuel being thoroughly mixed in the process. It is then carried by conveyor to the boiler room, where each individual furnace may be fed as much or as little as is required, any surplus being returned by the same conveyor to the fuel room.

Deep Water Docks to Be Constructed

The company will enjoy excellent transportation facilities over the Grand Trunk Pacific Railway by the means of spur lines to the mills and shipping sheds, while there is sufficient depth of water at the tail end of the mill to float a battleship. It is the intention of the company, when foreign trade develops, to construct deep-water docks from which ocean-going vessels may load. The plant will cater to the prairie trade, but much of the high-grade lumber will, no doubt, be exported. The local trade will also be a large factor in the business, and will be very closely looked after. Boat-building oak will be carried in stock, and it is believed that in the near future an extensive business can be built up in boat material, owing to the rapid development of the fishing industry in the Northern waters.

A box-making plant will, in all probability, be installed as soon as the mills are operating smoothly, and later on attenton will be given to the manufacture of yellow cedar.

The daily capacity of the sawmill, when completed, will be about 150,000 feet board measure, in addition to which a planing mill will be erected of sufficient capacity to take care of all upper grades not disposed of in the export market. The shingle mill will have a capacity of 150,000 shingles per ten-hour day. The supply of timber will be secured from contractors north and south of Prince Rupert, and possibly from Queen Charlotte Islands.

Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

R. G. Long & Company's new plant.

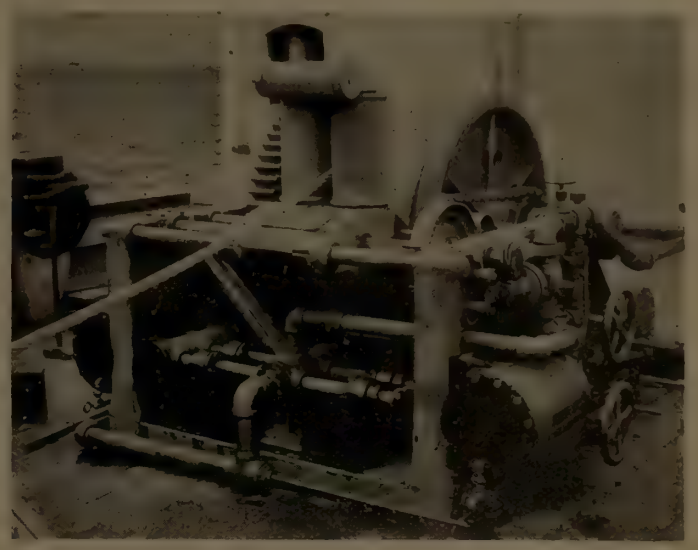
"Bob" Long Gloves, Overalls, Etc.

"Bob Long," union made, gloves and mitts, overalls, shirts, moccasins and high grade knit goods, are known in practically every part of Canada, and nowhere are they appreciated more than among the lumber camps. R. G. Long and Company, Limited, Toronto, who manufacture this excellent line, have erected a fine new five storey building in order to keep up with their increasing business. The popularity of "Bob Long" brands is based solely upon the high quality of material and workmanship used in their production. In the logging camps and sawmills, and even in the retail lumber yards, everyone knows how important it is for the workmen to have suitable and long wearing clothes. The overalls, mitts, etc., turned out by this company have been proved by experience to be the best that it is possible to manufacture, giving the men long wear and a comfortable fit. The same thing applies to the other lines turned out by this company. "Bob Long" is thoroughly acquainted with the camp trade. For a number of years he personally sold camp requirements direct, and thus learned all the fine points of what lumber camp men need and like. R. G. Long and Company have enjoyed such a constantly increasing demand for their goods that they have again found it necessary to extend their plant. This work will probably be commenced in the near future. Readers of the Canada Lumberman who are studying the market for clothing for their employees will do well to get in touch with this progressive firm whose address is 727-733 King Street West, Toronto.

"Bob" Long

The Corbet Automatic Steam Towing Winch

Readers of the Canada Lumberman have become familiar with the Corbet Automatic Steam Towing Winch, manufactured by the Corbet Foundry and Machine Company, Limited, Owen Sound, Ont., through the advertisements published by the company, and through the large number of their machines that are to be seen in operation wherever the towing of logs is carried on. The accompanying illustration represents the company's new design for their Nos. 1, 3 and 4 machines, the engines of which are on the outside of the frame. This permits the building of the larger machines much lower than the others, thus preventing the tipping of the tug when pulling at right angles to the tow, and it also makes it possible to get at the engines much more readily, in the event of any repairs being required.



The Corbet Automatic Steam Towing Winch

The company manufacture these machines in four sizes, and use galvanized steel towing hawser from ¾ ins. diameter up to 1½ ins. diameter, thus being able to accommodate any size of tug. An important feature of their machine is the friction between the drum and the gear, which allows the hawser to be paid out without starting up the engines, and permits the spool to be used for warping purposes without moving the drum. Thus, if the tug is towing a raft or scow with all the hawser out and drum held with the brake-bend, the engines can be run independently of the drum by disengaging the friction. The automatic valve makes it possible to pay out and take in the hawser automatically during rough weather, thus avoiding the danger of parting the hawser and losing the tow. An automatic hawser leader travels to and fro across the front of the machine guiding the hawser and preventing it from climbing on top of itself while being taken in, also allowing the tug to pull at any angle from the tow.

These machines permit the use of steel hawser which has a life of ten years at least, so that it is no longer necessary to purchase a new line each spring. The company report that they installed their first towing machine on the tug "Keenan" four years ago last spring, that it has given perfect satisfaction and that the hawser is just as good to-day as on the day when it was installed. They point out that the owners have thus been saved the cost of four towing lines

which amount alone to the cost of the machine. Similarly satisfactory results have been obtained by many other companies using these machines all over the Great Lakes and on the Atlantic and Pacific Coasts.

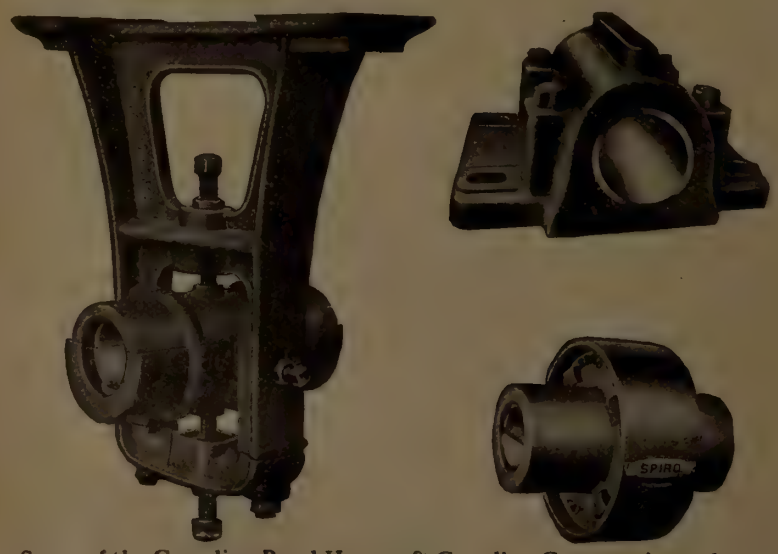
The use of these machines makes it possible to operate a tug with fewer men than formerly. It also permits the tow to be brought up close to the tug without having to back the tug up to the tow or scow; thus giving control in close quarters and preventing frequent trouble and damage.

High Class Transmission Machinery Equipment

Power transmission machinery is one of the most important features in connection with any manufacturing plant. Such equipment as shaft hangers, couplings, pulleys, shafting, pillow blocks, collars, etc., cannót be of too good a quality, if a plant is expected to give satisfactory and economical results. Lumber manufacturers and planing mill operators are intimately acquainted with this fact and will, therefore, be interested in the Bond "Double-Sure" Transmission Line, manufactured by the Canadian Bond Hanger and Coupling Company, Limited, Alexandria, Ont. This line has been on the market for the past quarter of a century and has been used extensively in many of the largest factories in the world. It has been endorsed by engineering departments, which find that it is splendidly designed from a mechanical point of view. Mill superintendents appreciate fully the economy of all the Bond bearings, which is the result of every bearing being babbitted and reamed.

Among the important products manufactured by the Canadian Bond Hanger and Coupling Company, Limited, are the Grundy Patent Flexible Insulated Coupling and the Bond Spiro Compression Coupling patented. The Grundy patented flexible insulated coupling is constructed of three pieces only, the two outer flanges being of cast iron and the centre disk of non-conducting material with lugs on each side for transmitting the power to the outside flanges. The company claim that this coupling will give less trouble and will outwear any other flexible coupling on the market. This is a simple and effective device for connecting the two ends of shafting where it is difficult to get the bearings in perfect alignment, or where they are liable to get out of adjustment.

The Bond Spiro Compression Coupling has the distinctive feature of a spiral slot cut the entire length of the sleeve. This enables the coupling to exert an enormous gripping power, as every square inch of bearing surface on the inner diameter of the sleeve comes in direct contact with the shaft. Another of this company's products, that is of particular interest to sawmill men is the Bond Heavy Rigid Pillow Block, Pacific Type, which is specially designed to meet the requirements of the sawmill trade. This pillow block interlocks the length and width of the bearing, and it is drilled and tapped for grease cups. Another interesting product is the Bond Scientific "Lytestrong" Steel Shaft Hanger. This hanger is folded into shape from sheet steel. It has a number of particularly valuable features which are explained in detail in an interesting booklet entitled "Points of Merit," published by the Bond Foundry and Machine Company, of Manheim, Lancaster County, Pa., U.S.A., the United States works of the Canadian Bond Hanger and Coupling Company, Limited. This booklet also contains illustrations and descriptions of many other of the company's products.



Some of the Canadian Bond Hanger & Coupling Company's products.

Modern Blower Systems

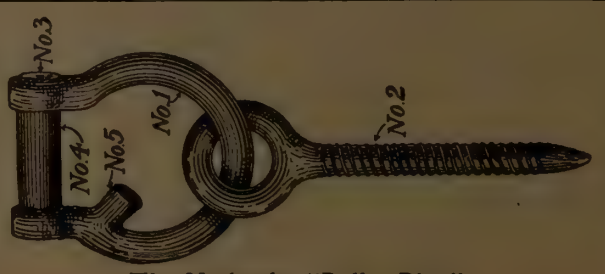
The Toronto Blower Company, 156 Duke Street, Toronto, are well known to readers of the Canada Lumberman through the excellent blower systems which they furnish. They manufacture everything required in the installation of a modern exhaust system, and they furnish skilled mechanics for the work of installation. The "Foster" blower is one of this company's principal products. This fan is of unique design, being a non-centre suction fan. Instead of a centre circular inlet, it has a segmental opening to the rear, immediately adjacent to the discharge duct. The fan wheel is so con-

Showing end view and S.K.F. bearings of 35-in. Blower and Exhauster, equipped with tight and loose special ball-bearing pulleys.

structed that the material entering the fan is immediately discharged, without passing through or around the wheel and they claim that it handles every conceivable material, wet or dry, without clogging, also that it is always in perfect balance. The "Foster" fan has three bearings, shaft extending through, with bearing on the inlet side, thus eliminating the overhung wheel, and avoiding heating, clogging, and shaking. This blower is specially designed for handling shavings, sawdust, excelsior, etc. The Toronto Blower Company also manufacture a complete line of fans, galvanized iron pipe, dust collectors, auto-furnace feeders, hoods for wood-working machines, buffing and polishing wheels. They have had many years practical experience which has enabled them to evolve efficient and correct designs for their various products. Their special heavy sawmill blower, they say, will blow the green sawdust from the low saw to wherever it is to be deposited, with very little power. The company will send an expert engineer of wide experience to inspect plants where installation of exhaust systems is being contemplated, or where alterations or repairs are under consideration.

The Neckyoke Roller Ring

The accompanying illustration represents the Neckyoke "Roller Ring," patented, for which Messrs. Clarke and Andrews, Pembroke, Ont., are agents. This is an article of great interest to all team users. It effects a saving in pole straps and prevents much lost time resulting from horses with sore shoulders. The old style of ring allows nothing for the constant rotating movement of the strap, or for the sudden jerk to which the horse has to respond. To the horse itself, the ring is a great boon. These rings are made from the best material obtainable, and the workmanship is guaranteed. The illustration shows the good points so clearly that they will appeal to all who know anything about the subject. Lumber manufacturers in Canada who have already made use of these rings are enthusiastic in their approval.



The Neckyoke "Roller Ring"

The first tannery built by the company.

A view of the modern belt shop.

Great Oaks From Little Acorns

The Graton & Knight Manufacturing Company, of Worcester, Mass., is one of the best examples of the fact that great industries are invariably the fulfillment of the aims and ideals of their founders. About the year 1847, Mr. Henry C. Graton and Mr. Joseph A. Knight went to Worcester from a neighboring town and secured employment with a card clothing manufacturer who later added a belt shop. Here they worked, making belts until, in 1851, they had saved a few hundred dollars with which they purchased the small belting business. This was the beginning of this great concern.

These two pioneer belt makers for some time comprised the entire organization of the company, currying the rough tanned hides and cutting them into belt strips, which they riveted or laced into leather belting. After a day's labor in the shop, Mr. Graton devoted his evenings to the bookkeeping, while Mr. Knight attended to the correspondence of the concern. When orders were few and the little shop lacked business, Mr. Graton left the currying table and belt bench and went in search of orders. Some of the same customers whom Mr. Graton first sold still have their names on the company's books.

In 1869 an important addition was made to the force of the company, when Mr. Walter M. Spaulding was secured to keep the books, handle correspondence, and assist Mr. Graton and Mr. Knight in selling the goods and filling the orders. Mr. Spaulding is at present the president of the company, and it is in no small measure due to his business ability and good judgment that the company has shown the steady and substantial growth which chacterized it since that time.

The first tannery was built in 1867 and had an annual capacity of a few hundred hides. Now 285,000 hides are tanned annually and manufactured into belting, and hundreds of leather specialties. In place of the two small rooms where the company originated, the Worcester plant consists to-day of twenty buildings closely connected, and having together a total floor space of about 600,000 square feet.

Nearly 1800 are employed in the Worcester plant alone, besides an office force of 200. In addition to the travelling salesmen, there are branch stores and agencies in all the principal cities in the United States and Canada and other large countries. Branch factories have been established in Cleveland and Detroit, to give better service to the western demands upon the organization.

The important relationship between scientific knowledge and practical experience was early recognized by the establishment of completely equipped chemical and mechanical research laboratories. The former thoroughly analyses all raw materials and supervises all tanning processes. Its investigations have effected many important advances in tanning methods. The mechanical department has caused many improvements in the interest of better belting transmission, and it maintains exhaustive records of original investigations as well as practical experience extending over a long period. This department is ready to assist all users of belting in the selection and adoption of the proper belt transmission, and will give anyone requesting it the full benefit of its valuable knowledge.

One of the prime factors in the success of this concern is the fact that they have originated and conscientiously maintained rigid standards of quantity. They manufacture a variety of different brands, each from a particular selection of the hide, and each suited to a different belting need. These so completely cover the entire range of belting requirements that they form a series. After years of careful classification and steady improvement, the characteristics of these brands have been fixed, and they are widely accepted as standards of quality in their line.

In order that no manufactured leather of any nature may leave the plant below the standard of quality which has been decided upon, a thorough system of inspection has been in operation for many years. This has resulted in a feeling of exceptional confidence among the users of belting sold under their trade marks.

Although belting is still the principal product of the plant, the company turn out many excellent specialties, such as textile and automobile strapping, clutch leathers for automobiles, leather packings and gaskets, cut stock for shoe factories, fine bicycle and motorcycle saddles, etc.

There is no better proof of the success of the policy of the founders than the fact that Graton & Knight belts and leather goods are used in the farthest corners of the world.

The imports of wood-pulp into Canada increased from $423,331 worth in 1915 to $552,002 in 1916. All this pulp came from the United States, from which country the importation increased by 74.2 per cent. There were no imports from Sweden in 1916 from which over 100,000 tons came in 1915, nor from Great Britain which sent 745 tons in the same year.

The factory of the Graton & Knight Manufacturing Company as it looks today.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted-Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Squares Wanted

Seasoned Birch and Maple, No. 1 Common, also 1sts and 2nds. Size 5 x 5 and 6 x 6.

Huntley Mfg. Company, Limited.

15-15

Wanted

Wanted second-hand timber, Fir, Spruce or Pine. State condition and price. Box 593, Canada Lumberman, Toronto, Ont. 12-15

Pulp Wood Wanted

We are prepared to buy large quantities of pulp wood for export to United States. If you are cutting and want best prices, write to Box 602, Canada Lumberman, Toronto, Ont.

BIG SNAP!

Fifty to Sixty Million Feet of Timber

White Pine, Yellow Pine, Fir, Larch, Spruce and Cedar. Large quantity Cedar Poles. Purchased seven years ago for $32,500. Now worth over $50,000. For quick sale will accept $25,000 cash. Write to Grand Forks Lumber Co., Grand Forks, B. C. 15-16

PROVINCE OF QUEBEC

Department of Lands and Forests

Quebec, 2nd June, 1917

Public notice is hereby given that, in conformity with the law, on the 21st of August next, at 11 o'clock a.m., at the office of the Minister of Lands & Forests Dept., Quebec, there will be offered permits to cut timber on lands belonging to the Crown in the Upper-Ottawa, Lower-Ottawa, St. Maurice, Lake St. John, East and West, Saguenay, Rimouski West and Bonaventure West agencies, comprising several large blocks in the Abitibi, Upper-Ottawa and head waters of the St. Maurice and Gatineau and on River Chamouchouan.

Permits will be adjudged to the highest bidder.

The price of adjudication is payable in 3 equal instalments.

The permit to cut will be subject to the ordinary conditions of the Law and Regulation and the grantees of any of the aforesaid territory must, within a delay of three years, manufacture, in the province of Quebec, with the timber cut in said territory, either pulp or paper in the proportion of ten tons per day, or sawn lumber in the proportion of ten thousand feet board measure per day, per hundred square miles.

Further information may be had by applying to the Department of Lands & Forests.

Elzear-Miville Dechene,
Deputy-Minister,
Dept. of Lands & Forests.

13-16

Administrator's Sale of Saw Mills, Timber Lands, Locations and Chattels

Tenders will be received by the undersigned Administrator up till noon, the Fifteenth day of August next, for the purchase of the Saw Mills, Timber Locations, Lands and Chattels, as hereinafter set out:

PARCEL No. 1

Lands in the Township of Chapman, District of Parry Sound:

Lot 30, Concession 6;
Lot 97, Concession "A";
North Part Lot 30, Concession 5;
Lots 17 and 18, Concession 7.

Timber Location in the Township of Chapman, District of Parry Sound:

Lots 19 and 20, Concession 4;
Lots 17 and 18, Concession 5;
Lots 15 and 16, Concession 6;

All of the above lots corner or adjoin each other, and are near the village of Magnetawan. Timber may be sawn either by erecting a mill at Hungry Lake or by hauling logs to Lake Se-Sebe. Other adjoining locations may be purchased.

PARCEL No. 2

Lands in the Township of Stisted, District of Muskoka:

Lots 9 and 10, Concession 5;
Lots 8, 10, 11, 12 and 13, Con. 6;
Lots 7 and 8, Concession 7;
Lot 6, Concesssion 8;
Lot 6, Concession 9.

Timber Location in the Township of Stisted, District of Muskoka:

Lots 6, 13 and 14, Concession 5;
Lots 2, 3, 4, 5, 6, 7, and 9, Con. 6;
Lot 4, Concession 7.

Sawmill and Machinery; Camps and Contents; Cookery and Contents; Farm Buildings; Farm Implements; Horses; Harness; Sleighs; Wagons; Water Carts; Patent Snow Plow; Mill Accessories; Contents of Filing Room, Blacksmith Shop, etc., all situated on Lots in Stisted Township, and at Martins Siding.

PARCEL No. 3

Saw Mill and Machinery; Booms, Chains, etc., known as the Briese Mill at Skeleton Lake. (Could be moved to Hungry Lake or Magnetawan).

Tenders will be received for any of the above three parcels or for the whole. No Tender necessarily accepted. Tenders must be accompanied by 10 per cent. of the purchase price, which will be returned if not accepted.

For further particulars apply to the London and Western Trusts Company, Limited, Administrators F.C.L. Waller Estate, or to Gibbons, Harper and Gibbons, Solicitors, London, Ont.

15-15

On Working Narrow Band Saws

Very narrow saws do not require to be tensioned to the same extent as wide saws. At the same time it is essential that the toothed edge should not be longer than the back, otherwise when strained on the pulleys the teeth would be slack and the saw would run and dodge in the cut. To lengthen the back the saw must be hammered by a series of light blows on both sides. The blows should fall at uniform distances, and close up to the back edge of the saw. A light, round-nosed hammer should be used, with the saw resting on the anvil. One row of blows will be sufficient for narrow saws, but two or more will be required for wider saws.

Twists and bends are removed by means of blows struck very lightly on the top of the ridge formed by the bend. When removing lumps, bends, or twists by means of a hammer the saw should rest on a block of hard wood placed endways on the grain, or, if the anvil is used, a stout piece of brown paper should be placed between it and the saw. —"Saws: Their Care and Treatment," H. Durham.

Surfacing Short Stuff

As this is an age which necessitates extreme economy in production, we would direct our readers' attention to the great saving which can often be effected in surfacing and jointing short stuff—crooked or otherwise—by the employment of an adjustable automatic feeding attachment. This can be readily fitted to most surfacing machines, and so arranged that it can be readily swung out of the way when not required, when the machine becomes an ordinary hand-jointer. With this attachment not only can about twice the amount of work be done, but it is of more even quality, and there is also immunity from accident to the workman. It is, in fact, in many cases a very paying proposition.

Ideal Wood Rack for Retailers

An ideal commercial wood rack for the office of the retail lumber dealer is one of the latest helps prepared by the trade extension department of the National Lumber Manufacturers' Association The rack has been arranged for the purpose of helping dealers to become more intimately acquainted with the many different commercial woods and to afford an opportunity to interest customers. It contains samples of thirty commercial woods, each marked with a celluloid label. Each sample is treated with a coat of shellac and the frame rack of oak is finished in a mission brown. There is a wood panel below for the name of the firm purchasing the rack.

Review of Current Trade Conditions

Ontario

The lumber trade in Ontario has not developed any new factors of importance during the past fortnight, but continues on a basis characterized chiefly by very firm prices and what may be called a normal war-time activity. In the local market—that is to say, the Ontario market proper, as contrasted with the export trade—there is a good demand, especially for good lumber which is in shipping condition. For all such stock that is available the demand is strong and prices are firm. In fact, the price is more a matter of what the owner thinks the stock is worth than what the purchaser is inclined to offer, as such stocks are scarce and much wanted.

The manufacturing trade are making very good enquiries, though most of them are for 1-in. dry lumber. The scarcity of dry inch stock is so marked that manufacturers and wholesalers report a correspondingly good demand for 2-in. stock, which is being resawed at the expense of the purchaser.

The trade with the United States is slackening on account of the decline in building activity. This is directly the result of the war. So long as the United States was not actually one of the Allies its industrial activity was so great that prosperity led to the erection of many houses, as well as warehouses, factories, etc., but with the entry of the United States into the war that country commenced to alter its business activities in much the same manner as they were altered in Canada in 1914. To-day the United States is, with certain well-defined differences, going through much the same situation as that which developed in Canada immediately after the outbreak of the war, and, for the time being, conditions in the lumber trade are none too bright, so far as building is concerned. Speculative building is very quiet, as all building materials are high in price. The lumber trade, however, will have to furnish such extensive stocks for government purposes of all kinds that before long the trade can be counted upon to improve and to develop a similar condition as to prices, available stocks, etc., to that in Canada. Temporarily, however, the demand for Canadian lumber is a little easier.

The outlook in Ontario shows no change; the prevailing opinion is that there is no doubt that lumber will cost more next year than it does to-day, and consequently some of the larger merchants are now covering their requirements freely. The general opinion seems to be that this is a wise course. No one expects to be able to purchase lumber next year even at the high prices that have prevailed this year, and when one considers the difficulties that will face the logging operators next winter, and the great car shortage that is practically certain to develop, there does not seem to be any doubt regarding the course of prices for lumber during the next six months or more.

The retail trade at Ottawa has again found it necessary to advance prices on account of the higher prices that are being asked by manufacturers. The latest advance amounts to about 10 per cent. Ottawa wholesalers are apparently in doubt as to the course of prices during the next few weeks, and are refraining from making quotations for anything except actual spot business. There have been fairly heavy shipments of lumber to the United States during the past fortnight, at good prices. The demand is mostly for lumber suitable for camp construction purposes. Prices of dry stock continue firm, with an upward tendency.

Eastern Canada

The lumber trade at Montreal has been somewhat quieter during the past fortnight than formerly, chiefly owing to the fact that a number of manufacturers have completed their shell box contracts and very few new ones have been placed. Musical instrument manufacturers are very busy, and are finding difficulty in obtaining their raw material from the United States. Although the car situation is not so bad as it was a few months ago, there is still considerable difficulty in getting shipments forward. The trade with the United States continues quite active and is taking large quantities of stock which formerly was exported to the United Kingdom. The shipbuilding business is growing more active and numerous orders for shipbuilding timbers are being placed. The export trade with Great Britain continues in the same condition as previously. Only a few cars of hardwood and spruce are going forward, on government account. Recently the embargo upon Canadian timber in Great Britain was discussed in the British House of Commons and although no definite promises were made the official reply indicated that there was a possibility of the stringency of the embargo being reduced in the near future.

The trade at St. John, N.B., has slackened greatly during the past few weeks. The quantity of stock shipped by rail to the United States is only about one-quarter of what it formerly was. There is a fair demand for only one line of Canadian stock in the United States and that is spruce boards. These are a little firmer in price than they were a fortnight ago. Other lines have receded slightly in price. Lath also are easier, and the demand for shingles has fallen off. There is nothing new to report in connection with the English market for spruce deals. Everybody is still wondering what the English Government will do in regard to the deal situation. Some mills have very large stock piled up, and may be forced to shut down within the next month or two unless some of it is moved. The effect upon next winter's operations is likely to be serious unless the uncertainty is removed. The reported removal of the English embargo, permitting deckloads of Canadian timber to be imported into England, and the removal of the price restrictions, are expected to improve matters and clear the air for Eastern operators. Fuller details on this development are being awaited eagerly.

Eastern spruce mills continue very busy on government orders, and the demand from private sources has also been increasing lately, so that stocks are not able to accumulate at the mills. The base quotation on frames is being maintained without any difficulty at $36. It is reported that some of the Canadian mills are a little more anxious for orders than others, and are offering stocks on the United States markets at a slight reduction. Boards continue firm. Southern rooters are scarce and expensive, and Eastern manufacturers are finding little difficulty in selling everything they have to offer along this line. Matched boards and random are both strong and in good demand. Present indications are that the general trend of spruce prices in Eastern markets will be upward during the balance of the season. The hemlock market is in much the same situation as spruce, only stronger. Government requirements have reduced mill stocks greatly, and retailers are finding it difficult to obtain what they need. Manufacturers, moreover, are having trouble in securing enough labor to keep production up to its present level. The demand for shingles at Boston is quiet, but sellers are holding prices firm. The lath market is quiet, and no price changes are reported.

Great Britain

In connection with the lumber market in Great Britain the most important event of the past fortnight was the announcement which reached Canada by cable about July 23 that the British Board of Trade has removed the restrictions on the importation of timber from Canada to the extent of permitting deckloads of Canadian timber to be imported without licenses. Furthermore, the cable announces that the January 31 price restriction will not apply upon timber imported from Canada after July 19. This is the most welcome news that exporters in Canada have received since the imposition of the embargoes, and it is expected that the British market will now take fairly extensive quantities of Canadian timbers. Almost coincident with the receipt of this cable, merchants in Canada began to receive enquiries from English importers, and everything points to a partial revival of this important trade. While deckloads will not by any means take up as much timber as was formerly shipped when there was no restriction whatever, they will permit a quite extensive trade. It is presumed that the Admiralty will regulate these shipments pretty closely, indicating exactly what stock is to be put on board. Vessels which are loaded beneath the deck with foodstuffs, munitions, etc., will take on a deckload of lumber, and probably the Admiralty will make use of such suitable stocks as are quickly available at the port when the vessel is being loaded. The last shipments of timber from Canada, previous to the embargo, were on a freight rate of about 300s. per standard. To-day the shipping companies are asking 350s., which amounts to about $47 a thousand feet.

The timber trade at London has been exceedingly dull of late. Stocks of imported wood are very light, really amounting to practically nothing. At the London docks there has been a little more activity, government cargoes of wood goods arriving from Norway, Sweden, and Canada. The importing trade has had practically no interest in these shipments, however. The spruce market at Liverpool has been practically dead, but there is considerable hope now that further arrivals of moderate proportions will be reported, since the removal of the embargo has been announced. The imports of Scandinavian goods have not been heavy, the market appearing to be very uncertain in regard to the outlook for this particular line. Stocks of Quebec pine deals and birch planks at Liverpool have practically disappeared, and importers will find a bare market to approach with new arrivals.

At Manchester the arrivals of Scandinavian timber have been a

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

B. P. Bole, Pres. F. H. Goff, Vice-Pres. E. C. Barre, Gen. Mgr. W. A. Saurwein, Ass't. Mgr.

little more numerous than formerly, but the trade in Canadian goods has been practically at a standstill.

United States

There is considerable uncertainty about lumber trade conditions in the United States at present. A midsummer lull, which is usual at this time of year, seems to have struck the wholesale trade, and retailers and manufacturers report increasing activity. Lack of definite information regarding the government's intentions relating to price regulation is holding the activity of the market down to some extent, and is encouraging the spread of a belief that prices have touched their highest peak. Orders for Southern yellow pine from the railroads and from the government are coming out extensively, and are more than compensating for the midsummer quietness that prevails in other quarters. While retailers are not extraordinarily active at present, they report a satisfactory volume of business in yellow pine, and it is noticeable that the line yards and large retailers are buying more heavily. Shipments of yellow pine have been large, but much of the stock shipped has been government business. The actual car situation is less satisfactory than it was. Both orders and shipments have exceeded production recently by large amounts, and unshipped orders at 141 mills recently amounted to over 618,000,000 feet. A year ago the orders on hand amounted to only a little over 300,000,000 feet. If the car shortage situation in the Southern States may be taken as an indication, it appears as though the car famine that has been foretold ever since the crisis of January, 1917, is beginning to develop, and there are many who predict that it will be the worst car shortage in history.

Conflicting reports are received in regard to the extent of the trade in white pine at Northern points. Some Buffalo firms report that trade has fallen off, while others still have a large amount of business on hand. There is no doubt about stocks being short, and for this reason the market continues strong. The middle grades are a little firmer than they were a short time ago, and stock is moving fairly well throughout the whole list.

Much of the same conditions prevail at New York, but there is a dropping off in the demand, on account of the building situation being hard hit. North Tonawanda wholesalers and dealers report continued activity in Northern pine, particularly in all common and low-grade stock and pattern lumber. Receipts by lake and rail have been heavy, but not sufficient to affect prices. There is also an increased demand for better grades at North Tonawanda, and a large quantity is being sold for shipbuilding purposes.

Hardwood market conditions have not changed. The demand for all kinds of woods suitable for the production of articles required by the government continues very strong. The slackening in the building demand has been noticeable, more particularly in small projects rather than large ones; and, as hardwoods are used in large buildings more than in small ones, the dropping off in the demand has not been greatly felt as yet. The price situation continues quite strong.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

St. John Trade in a Quandary

St. John, N.B., July 23—(Special to the Canada Lumberman):—From a selling and shipping point of view the lumber market at St. John is very dead. Up to the last two or three weeks considerable stock was being "carred" to United States points, but of late this has been cut down to about 25 per cent. of what it was, caused by a slackening in demand and reduction in price. It is understood that all United States war orders must be shipped from United States mills. This cuts out the Canadian shipper. Moreover, as prices of all materials going into house construction have advanced, the builder is placed in a difficult position because it is almost impossible to find buyers for houses erected at the high prices. The only stock that is firm and in good demand in the American market is spruce boards. These, if anything, are higher in price than two weeks ago. The rest of the sizes in 2 and 3 inch have receded in price about $3.00 per M. feet. Laths have also become a drug on the market and buyers in New England are hard to find. Shingles have receded in price and the demand for them has fallen off.

The English deal market remains unchanged. No stocks are moving and no prices are being offered, as buyers are not taking any further risk until a definite change comes. If the governments purchase any stock of deals, they will find the steamers. If they do not, it is a question what will be done with deals now at mills. Some mills are badly piled up and if stock is not moved during the next two months, the owners will be forced to shut down. It is of no use to quote prices on deals, as no buyers can be found, but as largely all mills at St. John had sold their season's cut, they do not feel the pinch of conditions quite so much.

What the outcome for another year will be is impossible to tell. At this time of the year a decision must be made as to future logging operations. Never were the mill men in such a position before; no price and no market. If any logs are cut under the present conditions it will be purely gambling on the future turning the right way.

Montreal Trade a Little Easier

Montreal, July 26: (Special to the Canada Lumberman).—Business, except for that with the United States, has slightly receded. Building is still at a low ebb, and the demand for shell box lumber is not as brisk as usual, owing to the expiration of some of the contracts. One or two orders have recently been placed, but they are not of sufficient importance to counterbalance those which have run out. The report is that no further large contracts will be given until September. The commercial box section is fairly good. Piano manufacturers state that they have all the business they can handle, but that they are held back on account of the difficulty of securing material from the United States.

Some wholesalers report that the car situation is by no means satisfactory, and it would appear that while one or two lines are giving good service, others are very slow in forwarding shipments.

Enquiries from the United States are still numerous, and trade with firms over the border is a very important factor in the general situation. The States are proving splendid outlets for the stocks of firms which previously exported to the United Kingdom, but now find the European markets closed.

Shipbuilding projects continue to increase. British and Montreal interests are likely to establish, at a Maritime province port, the largest shipbuilding yard and dry dock in Canada. There are plenty of orders placed in this city for timber for shipbuilding purposes, but owing to the demand in British Columbia for lumber, there is difficulty in securing stock. The edict of the Imperial Munitions Board prohibiting the use of B. C. fir in long lengths for ships built in Quebec is also a hindrance to business.

There is no improvement in exports to the United Kingdom. Occasional cars of hardwood and spruce are being shipped for government account. The question of relaxing the restrictions on exports has been taken up in the British House of Commons, but the official reply is not encouraging. Meanwhile some exporters are disposing of a portion of their lumber to Canadian and United States buyers.

Ottawa Retailers Asking for Ten Per Cent. More

Ottawa, July 23—(Special to the Canada Lumberman):—An advance of about ten per cent. with the retail trade, on practically all grades of lumber, has taken place in Ottawa during the last two weeks. Retailers claim that the steadily advancing manufacturers' prices have forced them to make higher quotations on their stocks. The manufacturers' prices, while not showing a great sudden advance, have been steadily climbing upwards for over a year.

The market situation during the past three weeks has been somewhat unusual and it is hard to determine what the outcome will be regarding relations between wholesaler and retailer. On one hand the manufacturers report a good season. The wholesale trade appears anxious to obtain new lumber, but the retailer says that he often cannot get quotations from wholesalers for the green cut. Considering the whole situation, it appears as if the wholesaler is holding back and seeking to find out what prices the next few weeks will be.

Though the usual midsummer lull is on there are indications of more activity this year than last. A keen desire is in evidence to determine what the fall operations and new orders from the United States will amount to. Some heavy shipments of lumber have left Ottawa during the last three weeks for destination in the United States. A United States buyer called on a retail firm here six months ago and wanted to place a large order, but on receiving quotation said the retailer was "crazy" to quote such a figure. Last week he returned

You Can Increase Your Present Production—with Less Help

By Installing JEFFREY LABOR SAVING CONVEYERS

For handling your Logs, Lumber, Refuse, Pulp Wood, and other materials

Nowhere in the Sawmill or Woodworking Plant is there an opportunity for Bigger Savings.

With Labor scarcer than ever before and Wages on the upward trend, the substitution of mechanical methods for the hand operations is an absolute necessity.

Let Jeffrey Engineers help you to prepare your plant to meet the extreme business conditions. As a preliminary, write for our Catalogs.

The Jeffrey Mfg. Co., Canadian Branch and Wareroom: **Montreal**

Handle Lumber for DISSTON SAWS made in Disston Mill

Portion of Apple Logs in the Disston yards ready to be sawn into boards from which saw handles will be made

Carload after carload of logs come into the Disston plant almost continuously to be made into handles for Disston Hand Saws and parts of other Disston Tools.

These logs are sawn into boards **in our own saw mill.**

Thus, not only are Disston mill saws constructed along scientifically correct lines, but they are constantly subject to practical test in the Disston plant.

Well made saws thoroughly tested are the saws for economy and satisfaction.

Henry Disston & Sons
Limited
Toronto Canada

TRADE MARK
REG. U. S. PAT. OFF.

and purchased 500,000 feet, paying $4 per M. more than the price quoted six months ago.

Inquiries from the United States have increased during the past two weeks and many of them are leading to sales and opening up new export channels. The demand is chiefly for lumber suitable for camp construction purposes and generally the lower rough grades. Dry lumber stocks have not shown a great deal of change since the last report. They are growing smaller, but the local demand is not heavy. Prices remain firm with an upward tendency, and there appears to be little indication of a decline in price. Mr. P. C. Walker, on his return from a visit to western Canada characterized the present situation as "a strong lumber market."

Work on shell boxes is keeping several of the mills busy and using up the dry lumber stocks. The Estate of James Davidson this month completed 60,000 9.2 boxes, and have secured new contracts for 15,000 six inch and 10,000 Bethlehem boxes. This plan will have its men in the woods by the middle of August, and two new camps with equipment for seventy-five men each will be put into operation. The John R. Booth plant, on account of European export channels being closed continues to make a light sawing cut, their mill now working only during the day. W. C. Edwards & Company say that business is good and their mills are having a good season's operations.

Glasgow Market Report

Cant & Kemp, Glasgow, Scotland, in their timber market report, under date of July 3rd, say:—

Wagon Oak Planks.—Stocks have been exhausted for some time, and as no licenses to import have been granted, no prices can be quoted.

Ash.—There are no stocks in first hands. Quotations are:—From 8s. to 8s. 6d. per cubic foot for first class logs, and from 7s. to 10s. per cubic foot for boards and planks, according to quality and specification.

Birch.—The demand for logs and planks is still good and stocks are very light.

Quebec Yellow Pine Deals, etc.—The turnover is confined to second-hand parcels as first-hand stocks are practically exhausted. Quotations are nominal and are as follows:—Firsts—Broads, 6s. 10d. to 7s. 3d. regulars, 6s. 1d. to 6s. 4d.; undersized, 4s. 9d. to 5s.; Seconds—broads and regulars, 5s. 2d. to 5s. 9d.; undersized, 4s. 3d. to 4s. 6d.; Thirds—broads and regulars, 4s. 5d. to 4s. 9d.; undersized, 4s. to 4s. 2d.; Fourths—broads and regulars, 4s. 1d. to 4s. 4d.; undersized, 3s. 10d. to 3s. 11d.; good sidings, 6s. to 7s.—all per cubic foot according to quality and specification.

Quebec Spruce Deals.—Stored stocks in merchants' hands are rapidly diminishing. Nominal quotations are:—9 inches and up, 4s. to 4s. 6d.; 8 inches and under, 3s. 7d. to 3s. 10½d.—all per cubic foot.

Lower Port Pine and Spruce.—The stock is being steadily reduced. Nominal quotations are:—9 inches and up, 3s. 11d. to 4s. 5d.; 8 inches and under, 3s. 6d. to 3s. 9d.—all per cubic foot.

Boston Market Conditions

In a letter to the Canada Lumberman, the Shepard and Morse Lumber Company, Boston, Mass., say:—

The particular developments in trade conditions of late are the great falling off in the demand in the United States for building material for ordinary dwelling house purposes and an increased demand for boards of various thicknesses for boxing and crating purposes, for factory flooring, and other classes of stock to be used in building extensions to factories. Some yard men are very busy with large orders for the barracks for soldiers or orders for shell boxes, crating and things of that sort, while others, who are in the country, and depend largely on the local building trade, are doing very little.

The prices on eastern spruce have fallen off quite a little of late on everything except lumber 1 inch in thickness or thinner, which is used for boxing and crating. House frames, dimension stock and lumber for ordinary building purposes, are easy and there are many mills that would like to ship. It is a question whether the falling off in the general building trade throughout the country will be offset by the demand for lumber for barracks, or cantonments as they are now called, and for crating and boxing and things of that sort.

In Canada, we believe, when the war started, the dullness in Montreal and other large cities in the building trade was more than offset by the demand for material for war purposes and prices kept on advancing. It appears to us now that the proportion on the building trades to the war requirements would be different in the United States, and we are inclined to think that prices cannot advance much further. In fact, there has been some recession on eastern lumber, as above mentioned.

Also, there is a matter of quite a good deal of concern, brought about by the constant embargoes on lumber shipments. For instance, a good many shippers of southern pine, of the roofer grade of boards, took orders last fall and winter and have been unable to ship the lumber on account ot the constant embargoes. The prices on these roofers have now advanced, probably largely because of the government's buying southern pine, and it is impossible now for these shippers to buy more stock and fill their old orders without making heavy losses. They have more or less been able to ship lumber they had on hand to fill these old orders, to points that were not embargoed in other sections, which they had to do or they would have had no money to pay their bills as they went along, and keep their men busy until the embargo is lifted, if it ever is. When they are again able to ship their goods they will not have the goods to ship without running against a big loss. Under these circumstances what the general strikes, fires and other liability clause which is usually in such sales will allow the shippers to do is uncertain. We think, however, there are many orders—thousands of carloads of this sort, which have been sold and which cannot be delivered, and the people who took the orders are very likely going to be unable to deliver them when the embargoes are raised. We had supposed the embargoes would be lifted this summer, but they seem to be as tight as ever and it is very disturbing to business, and it is bringing forward a call for a new code of morals, some people feeling that under the circumstances they are not responsible to fill their old orders so taken. Certainly they are not responsible to fill them until the embargo is lifted.

On the other hand the purchasers are taking it pretty good naturedly and are asking for shipments, and demanding them of late. Perhaps they realize the situation fully and see the futility of making such demands. In every way conditions are very much upset and uncertain here, at present.

Southern Hardwoods Market Report

The Hardwood Manufacturers' Association of the United States in their market letter, under date of July 21, say:—The hardwood situation is without precedent as to demand, supply and existing shipping facilities. The demand is greater than at any time in the history of the trade and there is being offered more business than the manufacturers can take care of.

There has been a very marked slump in building operations. This was reflected in the decrease of 34.4 per cent. in building permits taken out during June, as compared with the same period last year. The unprecedented demand by the Government for all kinds of lumber will, however, more than offset the decreased volume of normal building.

Shipments from the mills to market are being delayed by the car shortage and embargoes, but think what the situation will be when the movement of troops and Government materials is in full swing. It has been authoritatively stated that the Government will soon be using 75 per cent. of the total available railroad equipment in the country. We believe that every consumer of lumber who expects to run his plant during the fall and winter months is making a very serious mistake by not getting in transit now all the lumber that he can possibly handle.

Production at mills, particularly in the southern territory, is still below normal. A close examination of stocks on hand will reveal a decided shortage. June sales reports indicate that a very large proportion of the lumber at mills is sold and that a large percentage of the mills will have to run for the next sixty to ninety days at full capacity in order to put enough stock on sticks to take care of their present business. Lack of shipping facilities is creating an active shortage of stocks in many markets and despite the efforts of manufacturers, production is not getting ahead of shipments, and because of the present labor shortage, there is not much promise of improvement in the future.

Oak:—Everything in oak is active with the demand far in excess of the suply, prices remain firm and all changes are toward higher levels. The furniture manufacturers are turning more strongly to oak than ever. Construction material, bill stock of all grades and all lower grades suitable for crating and boxes are in good demand. The general demand for all upper grades continues good, quartered oak having shown considerable improvement. Timbers and special cuttings are exceptionally strong. This applies also to railroad car material.

Poplar:—The market for poplar is very firm. Buying on the part of dealers is good and all recent advances hold strong. Wide poplar and poplar box boards constitute a marked feature of the market at this time. In fact, there is absolutely no dull item in poplar. Every thickness and every grade is moving just as fast as mills can get a car to load it in.

Basswood:—It is almost impossible to get enough basswood to supply the trade. The demand still continues active. Stocks are low and prices remain firm.

Chestnut:—Sound wormy and No. 3 common in all thicknesses are in very strong demand and prices firm. 4/4 Fas chestnut is quiet with the thicker stock of that grade fairly active.

Gum:—The Gum Lumber Manufacturers' Association reports that June sales exceeded May sales by over 8,000,000 feet, indicating

An Enthusiastic Millwright's Results

S. F. Caldwell. Braeside, Ont., Describes Improvements He Has Made to Equipment of Big Mill

The equipment of the mill of Gillies Bros., at Braeside, Ont., was recently thoroughly overhauled and improved under the direction of Mr. S. F. Caldwell, head millwright for Gillies Bros. Mr. Caldwell has taken great pride in the carrying out of this important work, and, in a letter to the Canada Lumberman, says: "You would have to see the mill now to get an idea of the improvements that we have put in since I took charge of the mechanical end of it. We have two single band saws, one pair of twin circulars, 60 in. diameter, one 54 in. gang which runs 260 r.p.m. and two four-saw edgers."

Some time ago Mr. Caldwell had an exceptionally interesting piece of work to carry out, the result of a broken balance wheel in the stock gang. Regarding this Mr. Caldwell says:—"The first balance wheel had a solid hub with six arms and it weighed 6,200 lbs. The pillow block bolts of this wheel broke and the wheel itself followed suit. Looking around for a new wheel we were recommended to use one that looked good to me. It had a rim 9 inches deep, a 10-inch face, and a solid web which was 4 inches thick, between the hub and the rim. It looked like a splendid clean casting. Its weight was 7,200 lbs. We put it on and run it for six months, and the next season we had only run it for one month when it burst into fifty pieces and broke everything on that side of the gang. I would never recommend a solid flywheel again. There must have been a great strain from hub to rim, or it would not have flown into pieces.

"Then I made a drawing of a wheel with a split hub, and sent it to the foundry. It had six arms and 10 in. x 10 in. rim. It weighed about 7,000 lbs. This wheel will never give any trouble.

"There are a hundred and one things in this mill that I have put in to save labor. For putting logs on the twin carriage we have steam log loaders, and similar equipment for the band carriages. Also we have one steam nigger with steam set works for each carriage. We find this works very well. Our band saws are old types, but I have put on improvements which make them as good as some of a later date. I have put in frictions for raising or lowering the top wheel, which also puts on the strain on the saws.

"For a time our edgers gave us trouble. We could not get them to cut straight all the time, so I put chains behind the saws in an iron groove, with short spikes in the attachments of the chains. I used a number 75 Ewert chain. One end of the groove that the chain runs in is moveable, to carry the board in any direction.

"I really cannot give you a good idea of the fine equipment of this mill; it needs to be seen to be appreciated. It is one of the most up-to-date mills in the Ottawa Valley, and is especially easy on men."

Hun Prisoners Work at Lumbering

Canadian Front in France, July 5.—"Eyes lefdt!" "Eyes frondt!" Uttered in gutteral German, these commands sound strangely on a Canadian ear. Stranger still is the mis-en-scene whence they arise. For the non-com. who shouts the order is a hulking Hun in field grey, wearing the Iron Cross, and by his side marches a column of German soldiers. But no Mausers are in their hands, no bayonets at their sides, and the headgear is not that of one regiment.

Blue, red, yellow, white, border the caps of these men, and quite as diverse are the designs of their shoulder straps. Tall and short, fat and thin, many be-spectacled, mingle in this conglomeration of Prussians, Bavarians, Saxons, Wurtemburgers—no longer soldiers, but woodmen marching to dinner. They salute a group of Canadian officers as they pass, and the bully German non-com. in charge is quite evidently glad of a chance to air his authority a bit in public and do a bit of the swanking he was wont to do in the barrack square of Deutschland.

Don't Overwork Selves

It is in a pine forest of France that your correspondent saw these Boches working for the Canadians engaged in forestry work. Working, did I say? Well, imagine thirty-two husky Huns pretending to haul on a rope, leisurely pulling down a tiny jack pine, scarcely more than a sapling, and you can visualize their efforts. How an Ontario farmer would laugh at such "work." However, the Germans do accomplish a little. They quite evidently like this "job," and it confers an appetite and an appreciation of the comfortable huts in which they are housed.

By the roadside stands their own German "koch," and facing him a row of burnished kettles. Brimming with some savory stew, the steam ascends in fragrant clouds. To him in batches of twenty at a time come the prisoners, to fill their dixies and receive each one a generous chunk of bread. Squatting under the trees in this fine weather, they partake of their mid-day meal. Would that Canadians in Bocheland fared half so well. After feeding, several of the Huns produce long-stemmed pipes with china bowls, which they puff contentedly, their enjoyment unimpaired by any thought of the sentries who stand back among the trees in case some forgetful Hun might wander through the sylvan dells.

And what a pine forest is this! Its like does not exist throughout the length and breadth of Canada. A regular fairy-tale wood, this vast plantation of clean trunks, rising almost limbless to an average of fifty feet, green-topped, springing from an underbrushless carpet of moss and needles. They grow in yellow sand, these trees. The larger ones measure from 10 to 14 inches through at the base, and give some 40 feet of log.

Hark, Canadian lumbermen. In this country a stern government allows no timber-limit vandalism on the part of loggers. No brush nor slashing may be scattered about as in Canada, to start fires. Everything here is piled, swept clean. In the adjoining French section of this wood I actually saw windrows made of branches carefully tied together. Thus they are shipped off to Paris for firewood.

Canadians on the Job

In marked contrast to the Huns are the Canadian bushmen, who, overalled, stand in military formation ere they dismiss to lunch. A little group, they have charge of the more technical jobs. Soon a mill will hum in this vicinity, as others are doing elsewhere, turning out its full quota each day. These Canadian mills are not only supplying our own troops, but Imperial and French troops as well.

Canadians are hard at work in forests of beech, hornbeam, ash, oak, birch, cherry and chestnut trees, which are falling before them, and, oddest sight of all, are being pulled down by block and tackle. Such is the French fashion. Limbs chopped off, and a rope attached to its top, many a tree is torn out by the roots, which are afterwards sawn off. Queer lumbering perhaps, but it saves the older trees.

Picture a quaint village, mediaeval church, fifteenth century houses, an inn, from whose timbered doorway d'Artagnan might well sally forth at any moment. Picture an emparked chateau which escaped the revolution, whose pillared gateway was old when Marie Antoinette came joyfully to France. 'Mid such surroundings, among trees where the deer fed undisturbed, now rises a cloud of smoke, beneath which, entrenched among the new, white timbers of a brand new mill, a whirling fiend devours the woods.

Sawdust roads, slab piles, non-day whistles among such sur-

NEW YORK CITY

roundings. Sacrilege! Mais c'est la guerre! Alas, modern war is an ogre for timber. But then the trees will grow again; many are ripe for the saw; many more will be left standing. All is being done systematically under governmental supervision.

Valuable Timber

"Builders in Canada would be glad to pay $60 and $70 a thousand feet for this," remarked an Ottawa Valley lumberman, now an officer in charge of one of these mills. He referred to the beautiful, clear beech, which, alas, was being sawn into common planks for roads. "Does seem a shame to see such stuff being wasted when pine or spruce would do just as well. But the army simply has to have it, so we are turning it into lumber as fast as we know how. I sent planks like these, hot from the saw, to build the roads over which our guns were hauled up to Vimy Ridge."

Out of the hardwood Canadian millmen are sawing besides lumber, beams, trench timbers, railway sleepers, firing beams for 9.5 howitzers, etc. Fuel was scarce in the trenches last winter. If the Hun manages to defer his final thrashing until next year the boys in the trenches won't freeze for lack of waste wood. One mill commandant told me he had 1,000 tons of such stuff ready for them.

Canada's Lath and Shingle Production in 1916

Lath, which has a direct relation to lumber, shows, like the latter, a considerable reduction in cut (16.1 per cent.) in 1916, as compared with 1915. While the total cut was smaller the number of species from which lath was made was greater than in 1915.

The lath production during 1916 and 1915, by provinces, was as follows:—

Province	Quantity 1915 M pieces	Quantity 1916 M pieces	Total Value 1916	Average Value Per M 1915	Average Value Per M 1916
Total	**793,226**	**665,588**	**$1,743,940**	**$2.57**	**$2.62**
Ontario	309,022	231,829	727,159	3.00	3.14
New Brunswick	288,951	225,366	547,809	2.40	2.43
Quebec	55,204	67,689	190,206	2.67	2.81
Nova Scotia	59,921	50,205	101,609	2.15	2.02
British Columbia	46,345	45,729	96,900	1.69	2.12
Saskatchewan	23,611	25,061	36,768	2.00	1.47
Manitoba	8,910	17,314	37,323	1.59	2.16
Prince Edward Island	1,262	1,495	4,337	2.89	2.90
Alberta	.....	900	1,829	...	2.03

Spruce lath were produced to the extent of 665,588,000 pieces, as compared with 793,226,000 pieces during 1915. The total value was 1,743,940. The average value per thousand in 1916 was $2.62, and in 1915, $2.57. White pine lath came second on the list with a total production of 261,065,000 pieces, as compared with 320,012,000 pieces in 1915. The total value was $616,624. The average value was $2.36 in 1916 and $2.35 in 1915.

Shingle Output

Though British Columbia increased its shingle cut in 1916 all the other provinces show reductions, with the result that the total was reduced by 6.2 per cent. Cedar composed 96.2 per cent. of the cut, which is in keeping with the position this wood has held for many years in this industry.

The shingle production during 1916 and 1915, by provinces, was as follows:—

Province	Quantity 1915 M	Quantity 1916 M	Total value 1916	Average value per M 1915	Average value per M 1916
Total	**3,089,470**	**2,897,562**	**$5,962,933**	**$1.86**	**$2.06**
British Columbia	1,894,642	2,009,798	4,019,197	1.71	2.00
Quebec	574,797	414,951	966,836	2.20	2.33
New Brunswick	458,987	359,583	724,222	2.00	2.01
Ontario	93,497	76,374	189,422	1.89	2.48
Nova Scotia	30,733	22,772	39,814	1.69	1.75

Alberta	18,740	327	684	3.48	2.09

Lumber Business on the St. Croix

A despatch from Calais, Me., says:—A glance along the water front of this city would lead the observer to believe that the lumber shipping business of the St. Croix, which at one time was the leading business of the port, had entirely disappeared, but this is not so, for inquiry reveals the fact that lumber shipments are larger this season than for many years, but they are being made by rail instead of by the picturesque "windjammers" which formerly filled the local docks and wharves. The cost of shipments by schooner has increased so rapidly since the beginning of the European war that manufacturers find more profit and less labor involved in shipping by rail direct from the mills, and this is being done to a greater extent than ever before in the history of the lumber industry on the St. Croix. Of course, the manufacture of lumber has fallen off materially in recent years, but considerable lumber is being manufactured, and the easiest and quickest method of shipping the same is by rail freight. The vessel shipping business of the port is practically at a standstill so far as schooners are concerned, but occasionally a vessel arrives with coal, either for the railroad or local coal dealers.

Savings Effected by Ball-bearings

Absence of Heavy Starting Load Simplifies Power Problem—Greater Speed—Smaller Pulleys

Exhaustive tests in manufacturing plants have demonstrated that transmission losses, due to friction of plain bearings, amount to from 20 to 40 per cent. of the total power used in the plant.

Shafts in cast iron, babbitt or bronze bearings frequently become "set" if the shafting equipment is idle for any length of time. The oil is pressed out of these bearings and it is extremely difficult to start the shaft from rest. Again, when the bearings are operating at normal speed, rubbing friction is constantly consuming power at a sacrifice of efficiency. Ball bearings eliminate all these difficulties.

In ball bearings the starting friction is no greater than the running friction. This is a very important fact for, as it is not necessary to provide for heavier starting loads, a much smaller motor may be used.

In ball bearings rolling friction is practically uniform from rest up to very high speed. On this account ball bearings start with a minimum effort and operate at all times with the highest possible efficiency.

By the use of ball bearing hangers the loss due to friction may be reduced 60 per cent. Where ball bearing hangers are used, the selection of a motor for shop drives reduces itself to the problem of providing for normal machine power consumption only, without the necessity of providing for the heavy overload capacity usually required to "start up."

For example: If machines in the shop normally require 250 horse power to drive, and an additional 50 horse power is consumed by the line shaft in distributing this power, a saving of 50 per cent. of the power required for the line shaft will reduce the total power required by 25 horse power, i.e., 10 per cent. of the total. With a motor costing approximately $9 per horse power, there will be an initial saving of approximately $225 in the motor cost.

So far we have considered only the saving in power and the consequent lower first cost of the driving motor. In addition to the saving in power, which alone is a sufficient item, there is a saving in lubricant. It is necesary to lubricate high grade ball bearings only three or four times each year. The oil or grease supplied to each bearing at such times is considerably less than is generally supplied a babbitt bearing several times a month.

This economy in lubrication results from the fact that the liberal lubricant chamber around the bearing is sealed on both sides to insure the retention of the lubricant, as well as to protect the bearings from the intrusion of shop dust, grit, etc. The seal is such that the lubricant cannot leak out or creep along the shaft to the pulleys and belts, a feature which preserves the efficiency of the belts and eliminates the uncleanliness and annoyance of dripping oil.

In plants where the transmission is exposed to dust, moisture and grit, good ball bearings will give the best of service. All high grade ball bearings have a dust-proof housing which excludes foreign matter and holds the lubricant, since it is oil tight. Cement factories, foundries, woodworking shops and machine shops need these hangers to prevent hot and worn-out bearings.

Most shafting in plain babbitt bearings is run at speeds from 100 to 400 r.p.m., and if run at higher speeds, it is necessary to lubricate the bearings frequently to avoid hot boxes.

The best ball bearings may safely be run at double or triple this speed and the size of the pulleys is cut down so that the rim speed is the same as formerly. A considerable saving in the cost of pulleys can thus be effected.

Or, when operating at increased shaft speed, by keeping the main line pulleys close to their former diameter (thereby increasing the rim speed) narrower and lighter belts can be used. Working along these lines it is possible to effect savings which will minimize the difference in cost between the best ball bearing hangers and plain bearing hangers. And from the moment your plant starts operation, the ball bearing hangers are paying you dividends.

Instances are frequently encountered where a manufacturer is using all his available power and is even operating his engines and boilers or motors at a heavy overload. He constantly faces a complete breakdown of his plant. In order to add more machinery it will be necessary for him to invest considerable money in an extension of his power-generating equipment. If he were to use ball bearing hangers he could cut down his load materially and so have additional power for other purposes.

To the Lumber Companies of Canada:

You have the Goods. Place your Lists with full particulars in our hands. We are in daily touch with all the Buyers in the United Kingdom.

PLEASE NOTE.—We pay cash against all documents, and take the whole of the Delcredere risk on Buyers.

Install a KRAFT SODA MILL

CANADA has another big war opportunity: Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc., have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods.
The cost of installing plant is small and you make a sure profit from waste material.

EDGINGS

Ontario

Hall Brothers, Ltd., timber and lumbermen, Toronto, Ont., have obtained a charter.

The head office of the Hendun Lumber Company has been moved from Timmins, Ont., to Haileybury, Ont. The directors of the company feel that it is in the interests of the company to make this change.

Fire recently broke out in a pile of pine lumber at the sawmills of the St. Lawrence Lumber and Box Company, South Lancaster, Ont. The damage is estimated at about $3,000. The cause of the fire is unknown.

The Standard Chemical Iron and Lumber Company of Canada, Ltd., report that their plant at Longford was not destroyed in the recent fire at that point. The fire was confined to the barrel house and shipping-room, which were destroyed, entailing a loss of about $10,000. The heaviest loss was in stock and inventory, which amounted to about $40,000. All the loss was fully covered by insurance, and has been satisfactorily adjusted.

Midland Wood Products, Ltd., recently incorporated with head offices and plant at Midland, Ont., are successors to Benson & Bray, Ltd., and Playfair & Pratt. The officers are: President, James Playfair; vice-president and managing director D. S. Pratt; secretary-treasurer, Norman L. Playfair; plant manager, M. J. Bray; machinery superintendent, James A. Benson; directors: James A. Benson, M. J. Bray, James Playfair, David S. Pratt, Norman L. Playfair, Dwight J. Turner, and D. L. White. For some time to come the company will be running exclusively on shell boxes but later expect to do a general woodworking business.

Eastern Canada

The Log Supply Company, Ltd., Quebec, P.Q., has obtained a charter.

Damien Lalonde, Reg., lumber manufacturers, Montreal, P.Q., have been registered.

A contract has been awarded for the enlarging of the mills of Price Brothers & Co., Ltd., Kenogami, P.Q. The general contractor is G. B. Mitchell, 10 Cathcart St., Montreal P.Q.

A company has been incorporated at Chester Basin, N.S., under the name of the Chester Basin Shipbuildrs, Ltd. The president is Mr. A. H. Zwicker and the secretary is Mr. Howard Oxner. The company have orders for two vessels.

Extensive alterations are being made to their pulp and paper plants at Jonquieres and Kenogami, P.Q., by Price Bros. & Co., Ltd. One large addition has already been made and construction work for another is now in progress.

The Ernst Shipbuilding Company, Mahone, N.S., has been incorporated, with capital stock of $25,000. The president is Mr. William Duff, Lunenburg, and the secretary is Mr. Arthur Ernst, Mahone. The company have a contract for a 120 foot schooner.

The Lotbiniere Lumber Company, Lyster, P.Q., who recently lost their pulp mill and sash and door factory at Nicolet Falls, P.Q., by fire, report that they were only partially covered by insurance, to the extent of $36,000. They have not yet decided whether they will rebuild.

The Tusket Shipbuilding Company have been incorporated, with head office at Tusket, N.S., and capital stock of $75,000. The company will erect an up-to-date plant and build wooden ships. The president is Mr. Louis N. Fuller, 163 Hollis St., Halifax, N.S., and the secretary is Mr. George W. Edens.

The property of the Delmas Pulp and Paper Company has been taken over by the Peribonka Company, Ltd., with a capital of $1,000,000. The property consists of a ground wood mill and saw and planing mills, situated in the Lake St. John, P.Q., district. The ground wood mill has been idle for about three years while the other mills have been in operation. It is now proposed to re-start the former mill, the new company having purchased the assets from La Banque Nationale.

Western Canada

Fire recently destroyed the plant of Fargey & Smith, lumber dealers, at Belmont, Man.

Fire recently destroyed the factory belonging to the Grande Prairie Sash and Door Company, Grande Prairie, Alta.

The Chisholm Lumber Company, Ltd., has been incorporated, with head office at Edmonton, Alta. and capital stock of $50,000.

The Pacific Mills, Ltd., Ocean Falls, B.C., are increasing the output of their mill. The present output is 75 tons daily, and the company plan to increase it to 120 tons daily by the end of the year.

The C. & C. Shingle Company, Ltd., has been incorporated, with capital stock of $10,000, and head office at Victoria, B.C., to carry on business as manu-

facturers of and dealers in sawlogs, timber, lumber, shingles, wood pulp, and paper of all kinds.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 22nd day of September. 1917, for the purchase of License X1018, to cut 6,833,000 feet of spruce, balsam, and hemlock on an area situated on Link Lake, Range 3, Coast District. Three years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 7th day of September, 1917, for the purchase of License X963, to cut 8,070,260 feet of fir, cedar, hemlock. and spruce on an area adjoining Lot 651, Shelter Arm, Clayoquot District. Three years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for the Province of British Columbia until the 16th day of August, 1917, for the purchase of License X1005, to cut 3,150,000 feet of cedar, spruce, hemlock, and white pine on an area situated on the North Thompson River, near Hellroar Creek. Three years will be allowed for the removal of the timber.

The Beaver Creek Timber Company, Ltd., has been incorporated, with head office at Vancouver, B.C., and capital stock of $100,000, to acquire from John F. Tener and D. A. McCaskill certain timber limits and licenses held by them; also to take over certain agreements respecting timber held by them. Thy will buy, sell, import, export, deal in, and manufacture sawlogs, timber, lumber, shingles, laths, sash and doors, boxes, etc.

The San Juan Timber Company, an extra-provincial company, has been registered under the Companies Act, with head office at 818 Stahlman Building, Third Avenue North, Nashville, Tenn., and provincial office at 918 Government St., Victoria, B.C. The capital stock of the company is $175,000. Mr. Harry G. Lawson, Victoria, is attorney for the company. The powers of the company include buying, selling, and operating timber and timber lands.

The Sea Bird Timber and Logging Company, an extra-provincial company, has been registered under the Companies Act, with head office at 818 Stahlman Building, Third Avenue North, Nashville. Tenn., and provincial head office at 918 Government Street, Victoria, B.C. The capital stock of the company is $150,000. Mr. Harry G. Lawson, Victoria, B.C., is attorney for the company. The powers of the company include the operating of sawmills and other wood or lumber plants.

An Important New Industry

The Canada Stove and Foundry Company, Limited, Ville St. Laurent, Montreal, P.Q., are well known to many lumber manufacturers in Canada because of the excellent products they turn out. It is interesting to note that this company has recently been the cause of a new industry establishing itself in Canada. The company has already built a large enamelling plant for the purpose of enamelling both steel and cast iron stoves, ranges, or any kind of stove parts. They will also have in the near future, a full line of cast iron hollowware, druggists' enamelled sundries in any color. The production of this latter class of goods will be an entirely new industry to Canada. The special grade of enamel which they are using is adapted particularly for chemical work and for resisting strong acids. An interesting product of this nature will be their porcelain enamelled ice-cream containers in sizes ranging from one to forty quarts.

Shippers in this country have reason to congratulate themselves that government measures to lessen the freight car congestion are only of a persuasive nature. In Spain they do things rather differently. There, according to a U. S. Consular report, the freight stations are loaded with merchandise shipments. In order to relieve the congestion the government has authorized the railroads to sell at auction all merchandise not withdrawn by the consignee in five days from the date of its arrival at destination.

A despatch from Aberdeen, Wash., states that the International Union of Timber Workers have made a demand upon sawmills and logging firms which may bring about a strike. The sawmill workers are asking for a minimum daily wage of $3 and an eight-hour day. The loggers want a minimum daily wage of $3.50 and a nine-hour day.

The Hardwood Manufacturers' Association of the United States have published a revised issue of their grading rule book, effective March 1st. The book includes all rules adopted at the last annual meeting, as follows: Planed sawed red gum figured wood; quarter sawed red gum figured wood; selects oak; Fas wormy oak; No. 1 common wormy oak, and core stock.

What appears to be a record price for a carload of white pine lumber at North Tonawanda, N.Y., was obtained recently when the Northern Lumber Company invoiced a car loaded with that species of lumber at $3,024.38. White pine men there say this is the highest price they ever heard of for a carload of white pine.

The Logging Camp

DURING the past year one thing has stood out above all others in connection with the logging industry in Canada, namely, the fact that whatever other conditions may have affected the quantity of stock taken out of the woods, the labor shortage has rendered it impossible for anyone to operate as extensively or as economically as he desired. There never was a time when the logging business was surrounded by so many restrictions and uncertainties as those of to-day. With peculiar local variations, the same thing is true from one end of Canada to the other, but the difficulty caused by the shortage and inefficiency of labor is common to all parts of the country. In Eastern Canada, especially in those sections which in former years have carried on a large export trade in deals with Great Britain, the situation has been more trying than anywhere else, and to-day its uncertainties are such that no one yet knows to what extent he will be able to operate in the woods next winter; although at this time of year he should be developing and settling upon details of his whole logging plant for 1917-18. In Eastern Canada the export trade with Great Britain was completely shut off by the prohibition upon the import of timber imposed by the British Government which forced manufacturers to look to the United States market where an outlet has been found for much of the stock which in other years went across the Atlantic. Now, with the entry of the United States into the war, the situation is again one of uncertainty, although it is likely that the quantity of Canadian stock disposed of in the United States will be heavy, it is not possible to consider the United States market as even a moderately satisfactory substitute for that of Great Britain.

Much Depending on Export Business

Under these conditions logging operators in eastern Canada are watching the British situation closely, hoping that before long the British Government will find their own interests as well as those of Canada to harmonize in this matter and that the embargoes will be largely removed. The very latest news received before this issue went to press is encouraging in this connection. Meagre as the information so far available is, it appears to be authentic, and to open the way for a certain quantity of exports of Canadian timber exports to Great Britain. A cable despatch states that the British Board of Trade announced that restrictions upon the importation of timber from Canada have been relaxed, allowing timber as deck cargo from Canada without license. The January price restriction, moreover, is not to apply to timber imported from Canada after July 19th. While this will by no means place the trade back on the extensive basis which it formerly occupied, it will give encouragement to the manufacturers in eastern Canada. The whole logging activity of next winter in the east depends very much upon the situation in Great Britain and it is to be hoped that this easing off in the restrictions indicates that further concessions will be found possible in time to enable the loggers to go into the woods with reasonable certainty that there will be a market for their product when it has passed through the mills next summer.

Logging Supplies Still Advancing in Price

Another factor which has had a great deal to do with the logging situation during the past year, and which promises to have even more effect upon it during next winter, is the advancing cost of supplies taken into the woods. This affects eastern, central and western Canada to an equal extent. Food stuffs for men and horses and equipment of all kinds have advanced in price. Practically nothing that goes into a lumber camp can be bought to-day for less than 25 per cent advance on its price of a year or two ago, while in numerous cases advances of 100 per cent. and more have taken place, adding, during last winter somewhere in the neighborhood of $5 a thousand feet to the cost of operation. The increases in cost since that time have been continuous and extensive so that next winter's operations cannot fail to cost proportionately more even than those of 1916-17. While it is now costing much more to feed and keep the men in the bush, the men themselves are not able to perform anything like the same quantity of work as those of a few years ago. The pick of the men from the woods have gone abroad as soldiers or have found work elsewhere. Logging camps last year were manned by the most promiscuous, incapable, and uncertain crews that ever went into the Canadian bush, and during the winter of 1917-18 they will be even less capable. Thus the logging operator is losing, both on account of the high cost of keeping his employees and the reduced output which he is obtaining from them. Relief from this situation cannot be reasonably expected until the war is over and the men commence to return from the battle fields to take their places once more as producers.

The Outlook Uncertain

Taking all these facts into consideration it is neither feasible nor wise to attempt any discussion of the extent to which logging operations will be carried on during the coming winter in Canada. It is only possible to say that each operator will have to be a law unto himself, and watch closely all the factors that have a bearing upon his situation. Considering the likelihood of continued high prices for lumber next year; bearing in mind the problem of transportation which promises to reach a severe crisis during the coming winter and may continue its influence far into 1918; considering the local market conditions and the effect upon them of the severe trials that we are passing through to-day—endeavoring, in fact, to obtain such light as he can upon his own particular trade situation, it is up to each operator to-day to solve his own problem, to take such chances as he feels like taking and to go ahead on his own responsibility absolutely; feeling neither certain nor uncertain of the outcome, but knowing that from the time when the first tree is felled, until the end of 1918, all those difficulties which he has been facing on account of increased operating costs are likely to continue. There is nothing more certain to-day than that until the war has come to an end no improvement in these difficulties can be expected. Loggers and manufacturers alike must continue doing their share to maintain the industry of the country at a high producing level.

All that has been written above is by way of introduction to what is to follow. It is sufficient to call attention to these matters and then to drop them, and pass along to others which will take our attention away from such things and focus it upon pleasanter and more normal subjects. In the logging camp department of this issue we have sought to assemble an interesting series of articles upon subjects of definite interest to loggers. The department contains descriptive and other material of a definite and practical value, covering many of the aspects of the logging industry, and we believe that every reader of the Canada Lumberman will find something of definite interest therein.

Developing B. C. North Coast Timber

Ever since the Grand Trunk Pacific Railway reached its Pacific terminal at the city of Prince Rupert, B.C., the eyes of thoughtful coast lumbermen have been turned toward northern British Columbia and its grand stands of cedar, spruce, hemlock and larch. It was realized that the opening of railway transportation via Edmonton to the ever-expanding markets of the prairies and eastern Canada was bound to mean, in due course, the development of the timber resources tributary to the railway, with all that such activity implies in the way of development of an almost virgin country and, incidentally, competition in the eastern lumber trade at present enjoyed almost exclusively by the coast and mountain manufacturers. In the near future there are bound to be many mills established along the line of railway between the Alberta border and Prince Rupert, and also in the well-timbered territory to be penetrated by the Pacific Great Eastern Railway in its devious route from Squamish, on Vancouver waters to Prince George, the ultimate junction point with the Grand Trunk Pacific, a distance of about 480 miles, of which line a little over one-third is now completed and being operated. Plans are now being perfected for the establishment of a large pulp plant at some suitable northern point, and only recently work was commenced on a large tidewater mill plant on the Prince Rupert waterfront; extensive logging operations were opened up on one of the islands of the Queen Charlottes group, eighty miles out in the Pacific, and renewed activity was developed on the part of owners of three or four

small spruce mills on the islands, which are shipping to Vancouver.

Another verification of the prediction that important developments are in store for northern British Columbia is now afforded. Mr. J. A. McKercher, a well-known Vancouver lumberman, (president of the Barclay Shingle Company, Limited, Port Haney, B.C.) and several associates, have secured control of the extensive timber holdings of the Granby Consolidated Mining & Smelting Company, Limited, on Alice Arm, about 100 miles north of Prince Rupert, where the latter company's great copper reduction plant is situated. Sixty odd licenses are included in the deal, or approximately about sixty-five square miles of fine spruce, hemlock and cedar timber, most of it tributary to Alice Arm and adjacent waters. The syndicate has taken over the Granby Company's sawmill, installed about four years ago to cut lumber for the various buildings then erected, and men are already at work removing the mill to a more suitable site on the limits, where its operation will not interfere with the activities of the mining company. The mill will be enlarged and will receive new equipment which will about double the present output. The new company will be known as the North Coast Spruce Mills, Limited. This is not Mr. McKercher's first introduction to lumber manufacturing. He built, and operated for a time, the United Lumber & Shingle Company plant at Nanoose Bay, Vancouver Island, afterwards sold to British capitalists and now the property of the Straits Lumber Company. Mr. McKercher left Vancouver for the north on July 3rd, taking with him a number of men headed by George Apker, of Washington, who planned and superintended the erection of the Nanoose mill so satisfactorily that he has been selected to carry out the work for the new company.

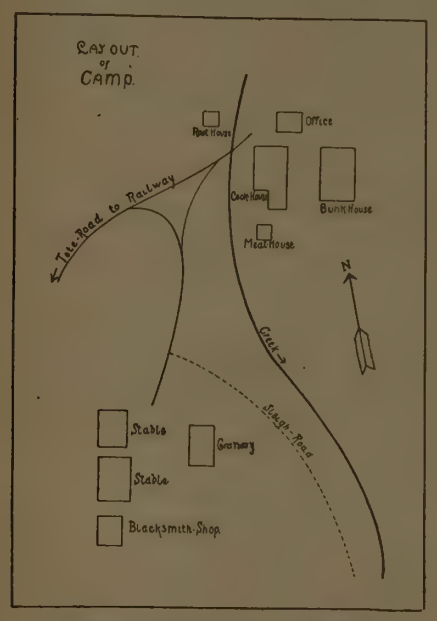
According to the scheme for the development of the great body of timber controlled by the syndicate, the new mill is likely to form merely one unit in a larger plan. The company will be guided by market conditions, and if these continue favorable, it is altogether probable that three or four similar plants—several having box factories in connection—will be established at various points close to the timber. It is believed that a system of this kind, which would permit of the closing of one or more of the mills in case of temporary depression in the industry, is preferable to establishing a mill of large capacity which could not be operated at a suitable profit under unfavorable price conditions.

The new mill will make a specialty of aeroplane stock for the present, the spruce timber on the limits being of a grade that will yield a large percentage of clear lumber. A large wharf is being erected at the mill site, which is in a sheltered cove, so that vessels will be protected in all kinds of weather. The company will ship their rough spruce to the prairie market and have already made application to the Grand Trunk Pacific management for transfer barge service to Prince Rupert.

Logging Operations Throughout the Year

Description of methods in use by the Fassett Lumber Company on privately owned limits in Labelle County, Quebec

By Otto Nieuwejaar*



Layout of One of the Camps

Editor's Note.—The students of the Faculty of Forestry of the University of Toronto, in their graduating year, visit some important logging operation, and, after studying it for some weeks, prepare a detailed report upon the operation. This report is submitted as a part of their year's work. Having already completed their course in forestry, the students are well equipped to prepare reports of this nature. In previous issues of the Canada Lumberman we have had the privilege of publishing extracts from some of these reports. The following report, furnished by the Faculty of Forestry, contains a description of one of the most interesting operations in eastern Canada. After a reference to the location of the operations in the County of Labelle, P.Q., 75 miles west of Montreal, and 50 miles east of Ottawa, the report states that the logging operations are conducted under contract, and then continues, in part, as follows:—

The mill and railway operated by the company are under its own management and the work is organized as follows:

Men in office
Woods Superintendent
Railroad Superintendent
Manager Mill Superintendent
Yard Superintendent
Master Mechanics
Walking-Boss

Everything is reported to the headquarters at once, reports being given by the superintendent every night.

The tract has been logged for eleven years, and it is estimated to yield timber enough for about ten years to come. Only first-class, sound and straight timber is cut for milling purposes, the other is left for use of the chemical plant located at Fassett. The company uses pine, spruce, cedar, hemlock, birch, maple, beech, basswood, oak, elm, and ash.

The timber is transported to the mill by railroad. As the country is very rocky, great difficulties arise in the location of the railroads. The railroad goes from the Ottawa River past the Canadian Pacific Railway line, the mill and chemical plant, in a northwestern direction along the Salmon River, sending a line up the west branch of the Salmon River. The timber is brought down to the railroad by means of sleighs. The manufactured lumber is shipped by way of the Canadian Pacific Railway, or by boats on the Ottawa River.

The laborers are mostly Frenchmen, the rest being Englishmen, Scotchmen, Irishmen, and a few Finlanders. Their wages run about 30 per cent. higher than under normal conditions.

The paid-up capital of the Fassett Lumber Company is $623,000. The company owns, besides the timber area, a mill and the logging railroad. It has no other investments. In Fassett, a very short distance away from the mill, is located a chemical plant belonging to the Standard Chemical Company, which uses nearly all waste products from the mill, and also cuts over the limit after it has been logged by the lumber company.

The mill was built in 1913, as the old mill was destroyed by fire that year. It has a capacity of 100,000 feet per day (10 hours). The power is supplied by a 650 h.p. Corliss engine. The refuse, which cannot be utilized by the chemical plant, is used for fuel material. The mill is equipped with two single cutting, 8-foot bands, automatic trimmer and slashers, and two heavy duty engines. The company also has a planing mill, equipped with planer and matcher, rip-saw and trim-saw. Sawdust is removed by a blower system. Power is supplied from a 125 h.p. engine, which is connected to a 70 kw. generator.

Around the mill there is piling room for about 14,000,000 feet of lumber.

The Logging Contract and the Contractors

All logging operations in the wood (except the railroad transportation) are done by contract.

The contractor, who has signed a contract for all the logging operations on the area, sub-contracts the different localities. He supervises the operations, but the real management of the work in the bush is done by the sub-contractors (jobbers), who employ the men they think sufficient, and otherwise direct the operations on their particular area.

The contract for the cutting of timber and peeling of hemlock bark contains the following main features:—The contractor agrees, in a good, thorough and workman-like manner, to cut down and peel all hemlock trees and parts of trees which will make good, merchantable hemlock bark, and to saw into logs of such lengths as the manager of the Fassett Lumber Company may from time to time direct all the timber trees or parts of trees which will make good, merchantable logs.

These logs are to be delivered to the railroad as the lumber company may from time to time direct for a total stated cost.

The contractor also agrees to peel all hemlock trees over 10 inches at the stump as soon as peeling is possible, on any portion of the land marked out for any season's operation, and to continue this procedure until the hemlock on each season's territory is fully peeled, so that the employees of the Standard Chemical Company can cut all beech, maple, birch, and ironwood of smaller dimensions into chemical wood. The bark shall be peeled, piled and delivered to railroad in a

Steam Log Loader Used by Fassett Lumber Company

specified way for a stated amount per cord. The contractor also has to load the bark on to the cars, if the cars are properly racked.

The contractor has to cut all maple, beech, birch, and ironwood that will make merchantable logs, down to 12 inches top end of a 12-foot butt log, and ash, oak, elm, and butternut down to 10 inches top of a 12-foot butt log.

All the other timber, as pine, basswood, spruce and hemlock are taken down to 6 inches top of a 12-foot butt log, of which the 6-inch and 7-inch logs must be from straight timber.

All the logs have to be cut and skidded as soon as possible. Hemlock logs should be stocked separately to the railroad. The contract also provides for logs to be cut into special lengths, and then to be skidded whenever the Fassett Lumber Company needs them. All logs should be cut 1-in. to 2-in. longer than required. The Quebec Rule should be used for scaling. In case of fire damage the logs delivered to the railway are to be considered legally delivered.

The Fassett Lumber Company agrees to build a main line of railroad as approximately upon the location already pointed out to the contractor, and to build train line up in hollows not exceeding 8 per cent. grade, where there is sufficient timber, so that the expense will not exceed $0.50 per M. feet, this without including cost of rails.

The forest is mixed coniferous and hardwoods, 60 per cent. coniferous and 40 per cent. hardwoods. Of the coniferous the spruces and hemlocks are the leading species, while the birches are by far the most numerous of the hardwoods. The reproduction of hemlock, and to a great extent of spruces, is fairly good.

The following table shows the percentage of felled timber used for different purposes:

Species	Saw Timber Per Cent.	Pulp Per Cent.	Ties Per Cent.
Spruce	80	20	
Pine	100		
Hemlock	80		20
Balsam	50	50	
Cedar	100		
Tamarack	50		50
All hardwoods	100		

The timber is not cut unless it is perfectly sound and free from defects, and is nearly straight.

Topographical Conditions

The logging operation examined was located in a small valley running in a northern direction from the west branch of the Salmon River. A branch of the railroad followed the narrow valley through which the river ran, and to this railroad the logs were hauled.

The valley in which the logging operation was carried on is very hilly and filled with boulders. A small stream runs through it, and the land around this stream is fairly even and boggy. The main hauling roads were therefore located along the stream. But the best stands were found along the hillsides of the valley, and the slopes here are mostly very steep and rocky, thus causing considerable difficulties for the skidding operations. Fortunately the main hauling roads all sloped toward the south or were located on fairly flat country, and only for small distances caused troubles on account of gentle up-slopes. Half the area, however, was difficult to log, due to the many steep grades and the abundance of stones.

Climatic Conditions

On this tract work continues during the entire year, and the climatic conditions are therefore of great importance. The summer is very warm, with little rain. During the months of June and July the men are mostly employed in peeling bark. After this period the felling and skidding operations start, and are carried on till the end of the year. The fall is cold and rainy and practically no snow falls before Christmas. The winter months are generally very cold, with an average snowfall of about 2 to 2½ feet. After the New Year the hauling begins, and is carried on till March. The spring is usually late and rainy. On account of having a railroad the company is able to transport the logs from the bush to the mill during the whole year. This makes the operation easier, as the logs can be left in the forest till needed, thus saving the more expensive storage place near the

Fresh Milk 'tho a Hundred Miles from the nearest Cow

GOOD, wholesome food is absolutely necessary to the health and contentment of your men in camp. Situated miles from the sources of **fresh** foods, as most camps are, the problem of good cooking becomes a serious one.

Milk is one of the essential foods. The question is **how to get milk** conveniently, and then how to keep it **sweet and fresh.**

The answer is—use KLIM.

KLIM is the milk solids of separated and pasteurized milk reduced to powder form. Only the purest and freshest milk is used in making KLIM—it can be used dry as a powder—just add to the other materials as you would sugar, etc.—or dissolve in water and use in liquid form.

KLIM will remain sweet and fresh until the last atom is used.

KLIM is not affected by weather—if kept dry and cool.

KLIM is packed in special 10 lb. tins for camp use. One pound makes four quarts of liquid.

Try KLIM—we will gladly send you a sample tin—to convince you that KLIM is the purest, most convenient, cheapest, no-waste milk you can buy.

The saving on freight alone—because KLIM bulks small—will reduce your operating expenses.

This illustration represents a tin of KLIM. In this tin is contained the purest and freshest milk reduced to a powder. No matter if you are a thousand miles from the nearest cow, and have KLIM, your cook has milk in the best form for cooking, or use in tea and other beverages.

All the goodness of separated milk is contained in this sanitary tin, and you can use a little at a time as needed, replace the cover and KLIM will keep pure and sweet indefinitely until used.

mill, and also making the work less dependent upon the climatic conditions.

The Logging Operations

When a camp ground has been located and cleared, the tote-road is built. The operation always starts from the lower end, near the railroad, and works backward. Then the roads are blazed out, and the cruising starts. The cruiser follows the roads that are blazed out and estimates strips from each of these blazed roads, and in this way the whole area is estimated. The cruising is generally done by the contractor and the owner of the forest. They use no equipment and no rules, as the estimating is done by merely looking at the forest. The sun is used to control the direction, and the estimators walk from one mountain to the other. The time required for this walk varies, of course, with the different conditions, but the average on this tract is about two hours per acre. Since the cruising is done by the owner and the contractor themselves, the cost per acre is very small.

After the cruising is done, the price of camp and roads, and other expenses of the logging operation are estimated. If jobbing is done, the price of the contract is determined from this, the contract being taken by the thousand board feet, delivered to railroad.

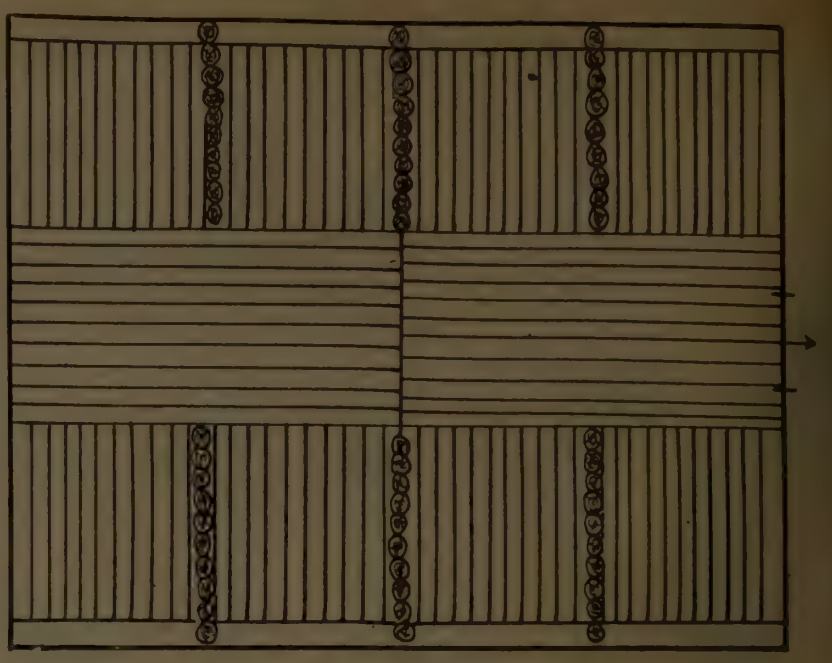
In all, 75 men were employed in this camp. They were mostly Frenchmen and Englishmen. The organization and wage-scale were as follows:—

	Monthly Wage
1 Contractor, in charge of work.	
1 "Straw Boss" (assistant foreman)	$65.00
1 Clerk (doing time-, store-, and book-keeping)	50.00
1 Main road-cutter ("buck-beaver")	40.00
10 Men for road-cutting	37.00
1 Filer (for 7 crews of log-makers)	50.00
2 Fellers	40.00
2 Skid-trail-cutters	35.00
1 Teamster	40.00
1 Roller	39.00
1 Blacksmith	65.00
1 Blacksmith's hand-man	40.00
1 Stable-boss	40.00
1 Cook	65.00
2 Chore boys	30.00
1 Toter	40.00
2 Tote-road repairers	35.00

The wages included board. They were higher this year than usual, being about 30 per cent. above normal before the war.

The Logging Camp

When a camp is located, many points have to be taken into consideration. The most important ones are the distance from the base of supplies, the accessibility of the camp, and the drainage away from the water supply. The camp which I visited was selected because there already was a camp built, which only required small repairs and enlarging. It was located on the tote-road, in the middle of the logging area, and had a creek with splendid water running through it. The camp was located on a slightly sloping place, and as the cookhouse was situated on the upper part of the slope, the drainage from the stables, etc., did not spoil the purity of the water. The distance to the railroad was about 1½ to 2 miles, and supplies were therefore easily brought to camp.



Plan of Stables

From this particular camp, about 3,000 acres, a yield of approximately five million board feet was expected to be logged.

An area of about three acres was cleared for the camp. The buildings consisted of:

Office, 16 x 20 feet—3 beds.
Cookery, 32 x 26 feet—3 beds and eating place for 75 men.
Sleeping camp, 40 x 26 feet—35 bunks for 70 men.
2 Stables, 32 x 26 and 26 x 24 feet—8 and 6 teams.
Blacksmith shop, 20 x 22 feet.
Granary, 25 x 20 feet.
Root house, 12 x 12 feet (inside).
Meat-house, 12 x 12 feet (inside).

For the building of the camp was required:

Office, 700 feet boards and 1,000 feet round timber.
Cookery, 2,000 feet boards and 1,000 feet round timber.
Sleeping camp, altogether 4,000 feet.
Stables, 900 feet and 800 feet.
Blacksmith's shop, 1,000 feet.
Granary, 1,200 feet.

For all buildings 200 pounds of nails were used; also 50 rolls of two-ply roofing paper. The office has four windows and one door; the cookery eight windows and two doors; the bunk-house six windows and one door; the other buildings have no windows and one door each. The size of the windows is 2 x 2 feet.

To build a camp with specifications as above, 25 men will be required for three weeks, and two teams. The tools necessary are: 6 canthooks, 20 axes, 6 shovels, 2 saws, 3 to 4 chains, 1 swivel, 1 evener, 4 hammers, 1 sledge, and 2 sets of harness. The cost of the whole buildings is estimated to be about $1,500.

The office, bunk-house, and blacksmith shop were heated by round stoves of the common type. In the cookery were two stoves, each 5 feet by 32 inches. The camp was also supplied with:

1 Baking box	7 Doz. teaspoons.
2 Frying pans (round, 12 in.)	7 Lamps for cookery
2 Frying pans (round, 6 in.)	1 Lantern for cookery
2 Frying pans (rect. 24 x 26 in.)	2 Barrels for water
1 Doz. Bread pans	2 Brooms
3 Mixing spoons	1 Duster for pans
3 Dippers	15 Yards net for table-cover
2 Water pails	2 Bean kettles (16 in.)
2 Washing dishes	3 Iron soup pots (10 and 6 gal.)
1 Washing tub	1 Tea kettle (6 gal.)
2 Doz. milk dishes	1 Tin water-boiler
12 Deep soup dishes	3 Large soup spoons
7 Doz. knives	2 Doz. pie plates
7 Doz. forks	2 Butcher knives
7 Doz. meat plates	1 Bread knife
7 Doz. tea dishes	6 Scrubbing brushes
1 Doz. syrup jars	3 Doz. towels
1 Doz. salt shakers	4 Lamps in sleeping camp
1 Doz. pepper shakers	2 Lamps in office
7 Doz. tablespoons	2 Lamps in blacksmith shop

As the camp had good connection with the village by the rail-

THE MOST OF THE BEST FOR THE LEAST

If it's a question of supplies it will pay you to consult us.

The question of feeding your men is always a considerable item, even under normal conditions ; but in these abnormal times it is exceedingly complex. Prices on almost every line used in the camps have advanced enormously, due, of course, to the war and the conditions which it has created.

While we, therefore, cannot quote you as favorably now as we could before the war started, we believe we can give you better prices commensurate with good quality, than any other supply house in Canada.

This is possible only because we do business on such a big scale, being the largest bakers' and confectioners' supply house in Canada, and because of our exceptional buying and manufacturing facilities.

We would like to show you how much it is to your advantage to get in touch with us and will gladly quote you on any of the following lines :

MINCE MEAT, JAMS and JELLIES, CHEESE, BUTTER, EGGS and EGG PRODUCTS, SYRUPS, FIGS, RAISINS, CURRANTS, CANNED FRUITS, POWDERED and CONDENSED MILK, BAKING POWDER, FLAVORING EXTRACTS, Etc.

Prompt and Satisfactory Service Assured

SEND YOUR ENQUIRIES TO

Bowes THE BOWES COMPANY LIMITED 72-74-76 FRONT ST. E., TORONTO FOOD SUPPLIES FOR THE CAMP Bowes

road, no commissary store was kept. The supply on hand was very small for the same reason. The men were well fed, and fresh meat was served at all meals. The cost per meal, per man, is about 12 to 13 cents.

The camp store is not very large, on account of the village being so near. The prices charged are either the same as in the stores of the village, or 5 per cent. more to cover tote-expenses. This 5 per cent., however, is mostly paid by the merchants, so the prices are generally the same as in Fassett.

The average value of stock on hand all the time is about $150 (for 75 men), and the stock consists of footwear, underwear, shirts, overalls, mackinaw coats and pants, socks, stockings, mits and gloves, towels, tobacco and chewing tobacco, pipes, patent medicines, fly-dope, jack-knives, shoe-laces, matches, and stationery.

The system of keeping accounts is the so-called single bookkeeping. The names and the amounts are put in the ledger, also the amount received. The balance is taken at the end of the month. A time-book is kept as ordinarily. The accounts are put in the ledger.

The Blacksmith Shop

The blacksmith makes all the sleighs used for hauling, and, of course, does all the necessary repairs. The supplies include hammers, augers, files, saws, braces and bits, chisels, bolts, spikes, nuts, rod iron, nails, etc.

The camp used 16 horses (8 teams) for the operation. The average weight of the horses was about 1,500 pounds, and they cost $200 each. They were fed three times daily, each time getting 1 gallon of oats and 10 pounds of hay per horse. The price for feeding should average about 25 cents per meal.

The epuipment of the stables is as follows:

1 set of harness		$70.00
1 set of blankets		5.00
1 water pail		0.30
1 lantern	per team	1.00
1 set of tongs		7.00
1 block and line		17.00
1 shovel		1.00
1 dung fork		1.00

Equipment for Transportation

All the skidding and hauling operations were done through the winter season. The equipment of the camp was:

1 wagon.
14 pairs of sleighs.
1 snow-plow.
1 sprinkler.
100 feet of chain per sleigh (4 corner-binds and "wrapper").
1 pair of tongs.
2 dogs. per team.
2 pulley-blocks.

Altogether the cost was estimated at $2,000.

The Fassett Lumber Company supplied all railroad equipment, which consists of:

3 Shay-geared Lima, Ohio, Locomotives, 55, 65 and 70 tons, average price	$12,000
1 Small switching (saddle-tank) engine, 25 tons	4,000
60 Logging cars	400
2 Bernhardt steam log-loaders	4,500

For inspection purposes a device was made of the use of an automobile on the rails, by flattening the tires, putting special sized flanged wheels over them, and then blowing the tires up firmly, the flanged wheels were held in place. This car proved to work splendidly.

The tote-roads are laid out from the farmers' clearing to the camp, located on the sides of the mountains and hills in order to avoid the mud.

The tote-road to camp was located in very hilly country, fairly steep grades occurring in a few places. To build one mile of tote-road it was estimated that 10 men were required for one week, using one team. This would cost about $205 to $210 per mile.

In the rainy season, when the roads were muddy, most of the repairs were done, and one or two men were employed for repair work during the entire season. The maintenance costs $600 per year.

The logging-roads are located in gulleys, and laid out to save grades as much as possible, steeper slopes than 5 per cent. being avoided where possible. These roads are built from brush and skids, and there are required five men during one week to cut one mile. No teams are necessary. This work costs $100 per mile, and about 35 miles of logging roads were necessary for this tract.

The railroad construction costs $6,000 per mile, this including grades, ties and steel, ballast and bridges, etc. The steepest grade tolerated is about 6.5 per cent., the average being 3 per cent. The railroad runs from Fassett in a northwesterly direction, following the Salmon River and one of its branches, for a distance of 28 miles (the switches not included). The topography of the country is very rough, thus causing considerable difficulties in the construction of the railroad.

Logging Practice

Seven crews were employed in felling and skidding. Each crew consisted of 6 men, namely: 2 fellers, 2 trail-cutters, 1 teamster and 1 roller.

Felling: Axes, saws and canthooks were used for felling purposes. The axes were double-bitted, with straight or bent handles made of hickory. They cost about $1.50 complete. Simonds cross-cut saws cost $5.00, and canthooks $1.50. Before felling, the tree was inspected for defects and crooks, and if it was found sound, the trail-cutter cleared around the tree and notched it, after which the fellers sawed it down, measured it into logs by the help of a wooden measuring stick 8 feet long, making the logs in sizes of even feet, usually 16 feet up to 20 feet, and then sawed it into logs. The trimming was done by the trail-cutters. No nosing or peeling was done.

Each crew could cut 80 logs per day, about 5,500 board feet. The cost of felling averaged last year $1.00 per thousand feet.

Skidding: When the logs are cut, the trail-cutter starts to make the trail, and skidding commences. A teamster with a team of two horses, assisted by a roller, forms the skidding crew.

The trails are cut very roughly, the worst obstructions being removed. The skidways are built alongside the hauling roads, landings located in a direction parallel to the roads and close up to them on the upper side, so that sleighs can easily be loaded.

In order to pull the logs up on the skidway, a head-block and two long skids 5 feet apart are used. Usually there are 40 logs to a skidway. Hardwoods, softwoods and hemlocks are kept in separate skidways.

Skidding trails were of different lengths, from 10 feet up to 500 feet. They were very difficult to locate, as the topography in many places was unusually rough, and most of them were of such character that it was entirely impossible to use sleighs. The logs remain on the skidways anywhere from a couple of hours to a few months.

In the skidding operation tongs and chains were used, and for pulling the logs up on the skidway, block and line. A crew can handle about 80 logs per day, about 5,500 board feet, and the cost will be about $2.00 per thousand feet.

Hauling and Transportation: Hauling starts as soon as the snow

CAMP SUPPLIES

We want you to know that we are in the Camp Supply business as far as Groceries are concerned, and we are in it good and strong. This is a branch of our business that we have specialized in for thirty years back, and consequently we do think that we know something of the wants of the Camp. There are very frequently lines of goods which are equally suitable for use, and at a wide difference in price. Now there's no use throwing good money away, particularly in these times of scarce commodities and consequent high prices. We would like to talk this matter over with any who are not now favoring us with business, and can do this either in person or by mail. We feel confident that we can make a conversation mutually advantageous, and there could be no more appropriate time to do it than NOW.

We always have on hand some attractive lines that are suited to your needs, and at present we here enumerate a few, and if you find on looking the list over that you are interested, why, just drop us a line and we'll get after you.

Santa Clara Prunes, small size but extra good quality, in 50's -	9½
1 Crown Seedless Muscatel Raisins, 50's - -	9½
Choice Seeded Raisins, 16 oz.	9¾
California Sultana Raisins, 50's	10½
Spanish Valencias, 28's -	7½
Siam Rice, good cooker, 100's	7⅛
Japan Rice, " " 100's	7⅜
Camp Blend Black Tea -	26
" " Mixed " -	24
" " Green " -	19
Japan Tea, good drinker -	17½
" Fannings, good drinker	14½

These Camp Blend Teas which we put out are models of their class. Every care is taken to ensure that the value for the price is there every time. If you will only take some of these on, we feel sure that you will repeat on them, for they are such good quality for such a low figure.

comes, which usually occurs in the beginning of January, and continues to the beginning of April. The roads are then sprinkled, in order to get a good hard surface. Three men are employed for road repairing, and one man to shovel snow.

A crew for loading consists of 2 senders, 1 top loader, and 1 tailer, who rolls the logs to the senders. The senders and the top loader are paid $40 per month, while the others receive $35.

The sleighs used were of the ordinary construction, the so-called "bob sleigh." The bunks were 7½ feet long, and equipped with 4 corner binds and one wrapper per sleigh. Twenty-five logs was considered a good load. The length of the hauls varied, of course, very much, the longest distance being about four miles, and the average two miles. Prices for hauling would run about:

1 mile, $1.00 per thousand feet.
2 miles, $1.25 per thousand feet.
3 miles, $1.50 per thousand feet (4 trips daily).
4 miles, $1.75 per thousand feet (3 trips daily).
5 miles, $2.00 per thousand feet (2 trips daily).

The logs are hauled to the railroad, where brush and other obstacles are cleared around the log piles, so that the loading can go on easily. The logs are put as close to the railway track as possible without interfering with the operation of the railroad, and must not be farther away than 75 feet. These piles are always located on the lower side of the track, and the logs are emptied into the piles without putting the logs in any order.

For loading the logs on cars, steam log-loaders are used. A steel wire is used for lifting the logs, which are held fast by the help of a tong with a ring. The cars are loaded higher up on both sides, and chains are tied around. A few are then placed on top of the chains, thus forcing these down in the open space in the middle of the car, and in that way the chains are made tight. The loaders can each handle 65,000 feet per day.

From the woods the logs are brought to the mill by the railroad. In winter the logs, when brought to the mill, are emptied into the "hot pond" in order to be thawed out before they are sawn. The hot pond, which is heated during the winter by means of exhaust steam from the plant, is 400 by 150 feet.

Logs are hauled every day, and in this way the company only hauls what is needed for the daily cut at the mill, thus saving storage place, and also being enabled to handle orders more quickly than usual.

Scaling: The teamsters keep tally of how many logs are hauled, and the sub-contractor's stamp is placed on the logs. The logs are scaled at the mill, by two government scalers, one being employed by the lumber company, and the other by the contractor. The Quebec Rule is used, the log being measured at the mill end. This is done when the log is taken into the mill to be sawn. For this work caliper and tally sheets are used. In case of defects, which, however, very seldom occur, the diameter is generally deducted about one inch. The cost of scaling was estimated to be 10 cents per thousand feet. The scalers were paid $75 per month.

	Per M. Feet
Making of logs cost	$1.00
Skidding	2.00
Trail cutting	0.50
Main road cutting	0.50
Hauling	1.50
Buildings	0.25
Total expenses ... delivered to the railroad	$5.75

After the tract has been cut for lumber, all standing trees are removed by the Standard Chemical Company, to be used in their factory in Fassett.

Gasoline Tractors for Winter Logging

Good results secured by River Ouelle Company—Train loads of log sleighs drawn direct to mill—Operating and construction details

The problems connected with the taking out of logs in the province of Quebec during the winter time, though similar in most respects to the problems in other parts of eastern Canada, are sometimes handled in a slightly different manner. An interesting example of this is to be found in connection with the operations carried on by the River Ouelle Pulp and Lumber Company at St. Pacome, P.Q. The accompanying illustrations give a good idea of a method which they have recently adopted for obtaining logs for their winter mills. The logs are yarded by the men in the bush, very much according to the usual manner in connection with other operations. Then they are hauled by gasoline tractor direct to the mill. This enables the company to keep its mill operating about ten months in the year. After operating this tractor for two years the River Ouelle Pulp and Lumber Company have come to the conclusion that the only satisfactory manner in which to utilize tractors of this type will be to have a spare machine, operating one machine night and day, and keeping the other as a spare in case of breakage or in case anything should get out of order. This is the plan they intend to adopt from now on if they are able to obtain a second tractor in time for their next winter's operations. Of course, it is essential under such circumstances that the two machines should be exactly similar, so that the parts may be interchangeable, otherwise one might not be much the gainer by having a second machine.

The use of a gasoline tractor makes it important, in fact necessary, to obtain specially skilled labor. The tractor requires good supervision and capable men to fill the positions of chauffeur and mechanics. In addition, it is necessary to erect a regular garage and heat it, also to have it well lighted so that the work may be done at any time, day or night.

It is not feasible in a published description to explain all the workings of such a tractor, such as the handling of the sleighs, etc. The general principles are fairly well understood by those who have had any acquaintance with other types of log haulers, but a knowledge of the etails can only be obtained by actual operations, or by inspecting an operation during progress.

The number of men employed in loading will depend to a great extent upon the length of the road, and the number of sleighs handled per day. The River Ouelle Pulp and Lumber Company consider at

present that it would not be advisable to operate these machines on a shorter road than about five miles.

Working Account for the Tractor

The River Ouelle Pulp and Lumber Company have kindly furnished us with a copy of their 1916 working account and other important data regarding the operation of this tractor. The cost of operating during the winter of 1916 was as follows:—

Working Account		Per M. Ft.
Chauffeur, gasoline, lubrication, superintendence, etc.	$2,260.92	$1.0833
Loading sleighs at rollways	1,850.58	.8869
Unloading sleighs at mill	1,206.85	.5782
Upkeep of road	1,259.00	.6033
Cost of making rollways	113.61	.0544
Cost per M. ft. mile .557	$6,690.96	$3.2061
Repairs		
On machine	$1,662.86	.7967
On sleighs	$ 455.38	.2182
	$2,118.24	$1.0149

Details of the quantity and cost of gasoline and oil used during the year were as follows:—

Total	
4,319 gals gasoline	$1,062.76
351¼ gals. Polarine	191.35
41 gals. Ren. Engin.	14.35
410 lbs. grease	35.50
85 lbs. white lead	8.95
	$1,312.91
Per M. Ft.	
2.07 gal. gasoline	$0.5092

The company started operations on December 22, 1916, and finished on March 31, 1917. The operating details of the season's work were as follows:—

Number of days operating	69
" days lost	15
" trips made	293
" miles run	3,372
" sleighs hauled	1,139
" logs hauled	71,317
" feet L. M.	2,086,984
" miles per day	48.87
" trips per day	4.00
" sleighs per day	16.50
" logs per day	1,033.60
" feet L. M. per day	30,245.62
" miles per round trip	11.51
" sleighs per round trip	4.00
" logs per trip	243.40
" feet L. M. per trip	7,122.68
" logs per sleigh	62.61
" feet per sleigh	1,833.00
" feet per log	29.26

Materials Needed for Twenty Logging Sleighs

Following are the specifications of material required for the construction of twenty logging sleighs:—

40 steel castings, couplings for runners, right.
40 steel castings, couplings for runners, left.
80 steel castings, couplings on rockers.
80 steel castings, rocker plates.
40 bunk pins, 16 in. x 1½ in. (round steel).
80 rocker-plate pins, 9½ in. x 1¼ in. with ⅜ in. cutter pins.
80 roller gudgeons, 10 in. x 1¼ in. - ⅝ in., hole bored in each.
80 reach-pole plates, 23 in. x 3 in. x ⅝ in., bolt holes drilled.
160 side plates, for runners, 24 in. x 6 in. x 7/16 in., holes drilled.
80 top plates for runners, 18 in. x 4 in. x ¼ in.
40 bunk plates, 18 in. x 10 in. x ¼ in.
40 rocker plates, 18 in. x 10 in. x ¼ in.
80 sleigh shoes, 8 ft. 10 in. x 4 in. x ½ in.
80 sleigh shoes, 8 ft. 10 in. x 2 in. x ½ in.
85 sleigh bolts, c.s. head, 5 in. x ⅝ in.
85 sleigh bolts, c.s. head, 8 in. x ⅝ in.
165 sleigh bolts, c.s. head, 10½ in. x ⅝ in.
85 sleigh bolts, c.s. head, 10 in. x ⅝ in.
85 sleigh bolts, c.s. head, 6 in. x ⅝ in.
1,200 machine bolts, 5½ in. x ⅝ in.
350 machine bolts, 8½ in. x ⅝ in.
500 machine bolts, 4½ in. x ⅝ in.
250 machine bolts, 4 in. x ⅝ in.
200 machine bolts, 11 in. x ⅝ in.
200 machine bolts, 8 in. x ½ in., c. s. head.
100 lbs. ⅝ in. washers.
50 lbs. ½ in. washers.
12 bars 1 in. round iron.
5/16 in. chain 7/6 in. chain.
80 straps for end of bunk ⅜ in. x 2½ in. run.
80 plates for end of stakes made of saw steel.
80 couplings atached with 5/16 in. chain to roller.
80 couplings—pins attached to rocker.
40 eye-bolts to hold chain to roller.
80 ferrules for end of roller.
80 staples to hold chain to stakes.
320 staples to fasten chain to bunks.
80 staples to hold coupling pin to bunk.
80 lock pins, for trip.
80 ferrules for trip poles.
3 forward coupling plates.
3 forward coupling pins 1¼ in. x 8 in.
40 staples for trip.
80 sleigh runners 8 ft. 9 in. x 4 in. x 9 in., birch.
40 rockers 4 ft. 8 in. x 8 in. x 9 in.
40 bunks, 11 ft. x 8 in. x 9 in.
80 reach poles, 5 ft. 9 in. x 3½ in. diameter, birch.
40 rollers, 4 ft. 2 in. x 4 in. diameter, birch.
80 stakes, 5 ft. x 6 in. diameter, birch.
40 trip poles, 8 ft. x 2 in. diameter.

Is Your Work Going With Vim Or Is It Just Dragging Along?

"Sit down, Thompson. How's the work going?"

"It isn't going—its ***dragging.***"

"What's the matter—men sore?"

"No! There's no complaint. Grub is good. Men seem willing enough—but they don't put their heart into the work."

"Say, Thompson, why don't you get real beds for the men, ***like the one I'm sitting on?***"

"Holy mackerel! I ain't running a Ritz-Carlton Hotel at my camp."

"I don't mean brass beds and Ostermoor mattresses; I mean vermin-proof steel bunks ***with real springs,*** upon which your men can relax comfortably after a hard day's work. They will be money in your pocket."

"You mean money ***out*** of my pocket."

"No, sir. The trouble with your men is lack of rest. They don't get a good night's rest on those hard, wooden bunks of yours that can't possibly be kept free from vermin; they can't do a day's work. Those old bunks are costing you a pile of money, because they are keeping the men from doing their best work."

"Tell you what, Thompson. Rip out the old wooden shelves that your men are trying to sleep on—put in ***'Alaska' Sanitary Steel Bunks***—and you'll find that your men will turn out about 25% more work. I proved it myself, and so did Miller." (***So have many others.***)

'Alaska' Sanitary Steel Bunks Cost More, But are the Cheapest in the End.
***Now* is the Time to Equip *Your* Camp with Them. May We Quote You?**

Changes in Camp Supply Prices

Market Review Prepared for Canadian Northern Loggers Explains Prevailing Situation in Most Lines

A market bulletin for their logging contractors is issued periodically by the Eastern Lands Branch of the Canadian Northern Railway, under the direction of Mr. C. T. Young. The latest bulletin available, under date of July 7, contains detailed references to market conditions regarding many lines of camp supplies, and is, in part, as follows:

Horses.—The horse market has been decidedly firmer than that of three months ago, and the purchase by the American Government of army horses across the line, together with the fact that horses for army purposes are again being purchased here, will stiffen the market further, with consequent higher prices. Logging horses are costing $25 to $40 more this year than last. Rejects from the British Government buyers' inspection have been selling at $135 to $170. Heavy draft horses, 5 to 8 years old, sound, 1,450 and up, are averaging $200.

Hay is selling in carload lots in Toronto at $12.50 to $13.50 for extra No. 2, and is about the same price throughout Northern Ontario. While this year's hay crop can hardly be expected to be as good as last year's, yet in Southern and Eastern Ontario, and part of the States, the hay crop seems likely to be good.

Flour.—The recent drop in the price of flour was in sympathy with wheat, due to the fact that there is scarcely any doubt that American Food Controller Hoover is taking steps for the government practically to take charge of the wheat and flour situation in its entirety. As Canadian Food Controller Hanna is working very closely with Hoover, the same thing will yet be reached here, and the market will unquestionably sag lower on flour.

Oats.—The only offerings in any quantity are Western, and oats are developing strength, due to war purchases, and in sympathy with corn on the Chicago market. It is good policy to buy no more than will carry you over until this season's crop is threshed. At our company camp we are going to feed corn mixed with oats this winter. Not only will it be cheaper, but there are more heat units in corn, which is an advantage under cold logging conditions.

Rolled Oats.—A strange thing has happened in the rolled oats market, for, while the price of packages have advanced to $4.75 per case, the price of bulk eighties has dropped to $3.50. This latter price may be expected to rise again strongly, as this cannot be anything else but a sag in the market.

Bran.—There is a light demand for mill feeds of the bran variety, the general quotation being $32. If the season continues wet and the good pastures now prevalent do not dry up. the demand will still be light.

Beef.—At the Union Stock Yards, Toronto, although there was a liberal supply, trading has been active at prices 25c to 50c higher than those of two weeks ago. Stall-fed cattle are almost all marketed. The highest price noticed lately for a straight carload of steers was $12.50 per hundred.

Hogs.—Hogs are strong. Mess pork, 200 pounds, is quoted in Toronto at $46 to $48; short cut backs at $48.50 to $50; pickled rolls at $48 to $49. The latter is much the better buy for this season of year.

Lard.—Lard always slackens off in July and August. List prices in most cases were 26½c, tierce basis, yet quotations were made at 25½c. Compound lard is quoted at 22¼c, and quotations have reached as low as 21¾c.

I recently brought to the attention of Food Controller Hanna the fact that we ourselves, and Northern Ontario in general, especially lumber camps, were coming down into the Southern market bidding and taking out meats by the carload at a time when we were supposed at least to be in a famine crisis, while at the same time our Northern woods were full of moose and other game and our large lakes, such as Nipissing and Nipigon, were teeming with fish. I stated that if ever there was a time that game preserves were intended for surely it was now, because if the game did take 25 years to recover from depreciation, it was nothing as compared to human life now being sacrificed, from which the world would not recover for 100 years. Mr. Hanna has thanked me for calling this so forcibly to his attention, saying that it will certainly receive full and due consideration.

Potatoes.—New potatoes in carload lots are not costing any more at Toronto at present than old potatoes, as they are now selling at $8.25 per barrel, which represents a decline of $3.25 to $3.50 per barrel. Food control will put the potato market in a much more favorable condition yet, and this, of course, will be materially assisted by the coming crop, which, to date, looks good.

Beans.—Imported beans have not at all filled the want for Canadian hand-picked beans. The small amount of these that were left after seeding seem to be holding out exceptionally well, and much better than expected, and are quoted in Montreal at $10.50 to $12 per bushel. The three-pound pickers are lower, at $9.50 to $10.50, while the five-pound are selling at $7.90 to $8.50 wholesale.

Sugar.—Sugar is likely to go up again for at least sixty days, due to Canadian canning factories and the demand from housewives throughout the country. This advance may be substantial.

Tea.—The tea situation is not getting any better, and is likely to get worse. Aside altogether from the question of supply in the Far East is the fact that boats make three and four trips to one between New York and the Continent, and there is difficulty in obtaining sufficient seaworthy tonnage boats for any trade from the Far East and Australia. Freight on tea has advanced from 5c to 6c a pound during the past ten days. The United States Government is likely to ask Japan for transport ships to carry troops during the next year, and this is going to put Japan and China tea in worse shape even than India and Ceylon tea. Try to use all the coffee possible. This is often possible for camp breakfast. The grade of coffee obtainable is going to be higher, because chickery is almost entirely out of the market. Bogota and Jamaica coffee are quoted wholesale at 27c to 30c.

Canned Goods.—There is a serious shortage of efficient help in the Niagara district, and the total output is likely to be more or less seriously affected. Quotations cannot yet be obtained on the class of canned goods we use in camp as far as the new crop is concerned. The following prices on canned goods are general quotations from wholesaler to retailer, and are not f.o.b. factory prices: Beets, 3's, $1.50 to $1.90; tomatoes, 2½'s, $2.35 to $2.50; peas, standard, $1.45 to $1.50; corn, 2's, $2.10 to $2.25; pumpkins, 2½'s, $1.95 to $2.10; apples, gallons, dozen, $4.

Molasses.—There has been a falling off in the demand for molasses and syrups of all kinds, due to their place being taken by other products during the growing season. Corn syrups, barrel, per pound, are selling at 6½ cents; maple syrup, $1.25 per gallon. We have been using the latter steadily for the last ninety days, and find that it pays, because it is taking the place of other foods which have gone higher.

Rice.—The easier tendency which the rice market has had recently has changed, and rice has advanced from $7.50 to $8 per hundred wholesale. Reports from the South are not encouraging. Little tapioca is being shipped from the Far East, and stocks are low. This is going higher, and is quoted around 13c, with sago at 12c.

Dried Fruits.—The new prune crop is reported as very heavy in California. Locally the market for dried fruit is quiet, in view of the appearance of fresh fruits on the Southern markets. Prunes are quoted, 30's to 40's, 25's faced, at 16c, and 90's to 100's per pound, 25's faced, at 10½c, the latter being sufficiently good for camp use. Evaporated apples are 14c to 14½c; apricots, choice 25's faced, 24c to 26c; figs, taps, per pound, 5½c to 6c.

Raisins.—Valencia (California) are quoted at 10½c to 11c, and Valencia (Spanish) at 10c to 12c wholesale.

Salt.—Salt has advanced 60c per barrel, the 103 barrel being quoted at $4.30. Bulk salt, ordinary fine, in 280 pound barrel, is quoted at $2.15, the coarse at $2.40, and the ordinary fine in 50-pound bags, at 45c. Each of these has, therefore, had an increase of 25c.

Gordon River Timber Company's Holdings

A large crew of timber cruisers, under the direction, and in the employ of James D. Lacey & Company, of Chicago, Seattle, and New York, the well-known timber land factors, are now engaged in making a detailed cruise of the timber limits recently acquired by the Gordon River Timber Company, of Maine. This tract consists of sixty-five perpetual surveyed timber licenses, aggregating upwards of 41,361.2 acres. The tract is located on Gordon River and its various tributaries in Renfrew District, Vancouver Island, British Columbia. More than 65 per cent. of the timber stands on the Gordon River drainage and the remainder on Harris and Caycoose rivers. It is said that the topography of the area is favorable to economic railroad building and logging. The engineers employed by James D. Lacey & Company report that the timber can be logged either by rail down the Gordon River to the San Juan Harbor, or to Cowichan Lake, or down the Caycoose River to the Pacific Great Eastern Railroad.

The Gordon River Timber Company was organized for the purpose of acquiring this block of timber from McClure-Atwood Company and McClure Timber & Logging Company, of Stillwater, Minnesota. The officers of the Gordon River Timber Company are: James D. Lacey, president; Victor Thrane, vice-president and treasurer; J. W. McCurdy, secretary. The directors are: James D. Lacey, Wood Beal, and Victor Thrane, members of the firm of James D. Lacey & Company; Edward E. Barthell, of Chicago; Thomas H. Hume, of Muskegon, Michigan; E. E. Moberly, of New York City, and F. L. Peck, of Scranton, Pennsylvania. The capital stock of the company is $400,000.

The company represents that the quality of the fir and cedar on this tract tributary to the Gordon River, compares most favorably with

some of the most famous fir and cedar belts of British Columbia. It is the intention of the company to carry this timber until market conditions warrant manufacturing.

James W. Sewall Office Busy

The James W. Sewall office, timber explorers and surveyors, Old Town, Maine, report the following work going on: Kenneth McR. Clark with two assistant cruisers, and other labor, is in the Upper St. John region of Maine, exploring 50,000 acres; R. L. Whitney, with three assistant cruisers and laborers, is exploring 100,000 acres on the lower St. John watershed; Wentworth Peckham, with two men, is cruising 10,000 acres in the divide between the head of the St. John River and Penobscot waters; W. F. Billings, with an assistant cruiser and several men, is cruising 45,000 acres on the lower Allegash watershed; C. E. Cobb with an assistant and labor is exploring 75,000 acres on the upper Allegash; A. J. Preble with two assistant cruisers and labor is exploring 85,000 acres in Aroostook River watershed; O. W. Madden with an assistant cruiser and help is exploring 100,000 acres in the Red and Fish River watersheds; James A. Conners is exploring 18,000 acres in Nova Scotia; Francis Dougherty about 20,000 acres in New Brunswick, and A. C. McPheters is making a rough reconnaissance of some 300,000 acres in western Ontario.

The Sewall office has about 50 men out and states that business is rushing, as far ahead as can be seen. Pulpwood is being looked after much more than saw timber at present.

R. A. Long and Associates Purchase Large Yellow Pine Operation

R. A. Long and associates have purchased approximately 550,000,000 feet of long leaf yellow pine, mill, railroad, etc., from the Mississippi Lumber Company and the Estate of Jacob Haynes. The mill is located at Quitman, Mississippi, and the timber lies tributary to the plant in Wayne, Clark, and Lauderdale Counties, Mississippi. While the consideration has not been given out for publication, it is understood that it involves in the neighborhood of $3,000,000. The negotiations and sale were conducted through the firm of James D. Lacey & Company, timber land factors, of Chicago. While the Long-Bell Lumber Company has purchased a number of large yellow pine operations in the past decade, this purchase will be of special interest to lumbermen as it is the first time the Long-Bell Company has become interested to any extent in manufacturing yellow pine east of the Mississippi River.

The Field Lumber Company's New Plant

The Field Lumber Company, Limited, Field, Ont., who are widely known as manufacturers of white pine lumber, spruce, lath and shingles as well as cedar poles and piles, built a new mill last winter in order to double the capacity of their old mill which had become too small to handle their cut. In connection with the new mill they have installed two boilers 60 in. x 16 ft., with Dutch ovens, and are using sawdust for fuel. This is giving them very satisfactory results and they have plenty of steam to operate the mill. The engine is 18 x 24 and furnishes ample power for the plant. The equipment includes a steam feed carriage, steam loader, steam nigger, one circular saw, a Rogers gang edger, and a lath mill.

The mill is now turning out 40,000 feet and from 20,000 to 25,000 lath per ten-hour day, but the company expect, when the mill has been in operation a little longer, to be able to increase this output by about 10 per cent. As all the refuse of the mill is needed at present in order to even off the yard, the company have not yet installed a burner, but intend to do so soon.

The company report that their cut this year will probably be about 3,000,000 feet. They would have liked to turn out about 50 per cent. more than this, but were not able to do so, as they could not obtain a sufficient number of men during their woods operations last winter. Next winter, they intend, if possible, to take out about 6,000,000 feet. Their mill can handle this amount easily, working only in the day time.

The company's yard is along side of the main line of the Canadian Northern Railway, and they have two spurs about 600 feet long. The yard includes plenty of space to handle 10,000,000 feet. At present they have spurs enough to handle 3,000,000.

Eastern Lumbermen Hold Convention

The third quarterly meeting of the Eastern Lumbermen's Association was held on July 12th at Hampden, Me., at Clark's Bungalow. Previous to the meeting members present enjoyed an old-fashioned State of Maine Shore Feed, during which an excellent musical programme was also provided. A short amount of after dinner speaking was also indulged it. The business meeting was interesting and important, and provided an opportunity for the members to discuss many matters of trade interest. In the evening a buffet lunch was served at the club house, after which the members departed for their homes.

Increased Spruce Production Cost

Quebec Manufacturer Reports an Advance of $2.36 per M ft. for Logs Delivered at the Mill

The figures showing the cost of producing spruce lumber in Eastern Canada, which we published in the Canada Lumberman recently, have been commented upon favorably by a number of readers, most of whom agree that the increases shown are closely in harmony with actual results. One of our readers in the province of Quebec has prepared an analysis of the cost of producing spruce lumber in connection with his operations and has forwarded this to us for publication. This operation is a typical one, of sufficient extent to be considered as about an average of the majority of the operations in the province and its figures therefore are of definite value. The costs analysis furnished by this company relates at present only to logging and driving, thus showing the cost of the logs delivered at the mill. The same company has promised to furnish an analysis of the sawing, piling and shipping costs early in the fall, so that it will then be possible for us to present figures of the complete operations from the woods to the product ready for shipment on the cars.

This company's analysis of logging and driving costs is as follows:—

Logging Cost Per M. Ft.

	1915 and 1916	1916 and 1917
Men, board	$1.24	$1.40
Men, wages	3.28	5.15
Horses, feed	1.24	1.47
Horses, wages	.39	.44
Tools, etc.	.41	.27
Total	$6.56	$8.73

Driving Cost Per M. Ft.

	1916	1917
Men's board	$0.24	$0.19
Men's wages	1.07	1.30
Tools, etc.	.08	.09
	$1.39	$1.58

Cost of Logs at Mill

	1916	1917
Logging	$6.56	$8.73
Drive	1.39	1.58
	$7.95	$10.31

Increase in cost—$2.36 per M. ft.

Other manufacturers are requested to submit figures of their costs so that this important subject may be discussed as fully as possible.

Mr. Hardy's Evidence at Insurance Enquiry

In reporting the evidence given by Mr. E. D. Hardy, the Ottawa press made it appear that Mr. Hardy was in favor of a five per cent. tax on unlicensed companies, whereas the government tax on such companies is now one per cent. Mr. Hardy was not in favor of increasing the tax on unlicensed companies, but was strongly in favor of increasing the tax payment to the Dominion Government on Insurance Companies licensed in Canada and the elimination of a certain class of smaller insurance businesses.

The following statement has been given the Ottawa representative of the Canada Lumberman, by the insurance firm of Hardy and Reynolds—The Canadian Lumberman's Insurance Exchange.

"Mr. E. D. Hardy, of the Canadian Lumberman's Insurance Exchange, recently testified at Ottawa before Mr. Justice Nasten, of the Ontario Insurance Commission, on behalf of the Reciprocal Insurance Companies. It was his opinion that there should not be a tax on unlicensed companies specializing in insurance on lumber and woodworking plants. This is in keeping with a resolution recently passed by the Canadian Lumbermen's Association at Toronto opposing any further tax for this class of insurance."

Brompton Pulp & Paper Dividend

The directors of the Brompton Pulp and Paper Company, Limited, have declared a quarterly dividend of 1¼ per cent. The figures for the first half of the year show a revenue of $664,156 from pulp and paper and on sawmill account, and after payment of expenses there is a surplus revenue of $617,263. Interest and dividends absorb $290,089, leaving $326,274.

Johnson's Veterinary Remedies

are the surest, the most economical and the best medicines with which to equip your stables. They have been on the market for twenty-five years and still retain their superiority over all others. The quality never varies, it is our first consideration.

Prices taking effect July 1st are as follows:

Johnson's Horse Liniment No. 1	Per Gal.	$7.00
Johnson's Horse Liniment No. 1	Quarts, Per Doz.	19.00
Johnson's Horse Liniment No. 1	Pints, Per Doz.	10.00
Johnson's Horse Colic Remedy	Per Gal.	10.00
Johnson's Horse Colic Remedy	Qu. (8 Doses ea.) Doz.	23.00
Johnson's Horse Colic Remedy	Pints (4 Doses ea.) Doz.	12.00
Johnson's Veterinary Healing Ointment (Gall Cure) 2 lb Tins	each 2.25; Doz.	24.00
¼ lb. Tins	Per Doz.	4.00
Johnson's Concentrated Condition Powders 1 lb. Pkgs.	Doz.	4.80
Johnson's Horse Worm Powders, Pkgs.	Per Doz.	2.50
Johnson's Purging Balls	Per Doz.	2.50
Johnson's Antisepting Dusting Powder (For Drying and Healing Sores, Proud Flesh, etc.)	Per Doz.	8.00

Our Family and Van Remedies are as follows:

Pine and Tar Cough Syrup
Purgative Pills
Little Liver Pills
Porous Plasters
Stomach Bitters
Laxative Cold Tablets
Big 4 Liniment—Mosquito Oil
X Ray Liniment
Cholerine Mixture (Diarrhoea)
Headache Powders
Mosquito Oil
All Healing White Ointment

All Drugs and Patent Medicines at Market Prices—Mail orders solicited—Prompt shipments made

No. 139 Michigan Lumber and Skidding Harness.

This is the heaviest Lumber and Skidding Harness we manufacture. It is strongly made from No. 1 selected Oak stock and so constructed to stand the heavy strain of bush work and lumber hauling. To convert to skidding harness, remove the breeching seat and side straps and add cruppers to snap. This harness is being used by all the leading lumbering concerns throughout Canada. It has stood the test and every set carries our guarantee.

ST. JOHN, N.B.

Knox TRACTION UNIT

2-Ton Unit, $565; 3-Ton Unit, $815; 5-Ton Unit, $1070, f.o.b. Toronto

The LARGEST Hauling Capacity for the SMALLEST Original Investment

Particularly suitable for Hauling Lumber

THE Knox Traction Unit combines any new or used pleasure car or truck with any horse-drawn wagon or inexpensive load-carrier, and forms a modern tractor of two, three or five tons capacity.

Cuts the high cost of motor trucking. Almost any touring car or runabout chassis answers perfectly for the power plant of the outfit.

Any horse-drawn truck or wagon (stake body, platform body, extension lumber wagon, moving van, or bottom dump body) answers perfectly for the load-carrier. The Traction Unit itself is built in accordance with the best motor truck practice.

The Knox Tractor Idea. The Knox Tractor idea is proved sound by every locomotive and every towboat—they do not **carry** their loads upon their backs—they **haul** their loads behind them.

With the Knox the change from horses and wagons is made at least cost because horses are high, and it is unnecessary to buy wagons—and as everybody knows, good second-hand pleasure cars are as numerous as rooters at a ball game. All you need buy new is the Knox Traction Unit itself.

Largest Hauling Capacity for the Smallest Original Investment. The Knox Traction Unit proposition must appeal to all coal and ice dealers, contractors, wholesale grocers, lumber dealers, storage and moving van people, farmers, general draymen — in fact, all who handle heavy loads.

A Demonstrated Success; Not a Makeshift. The Knox will move anything, go anywhere exactly like a two to five-ton truck costing several times as much. It will turn around in less space than any motor truck of equal capacity. Backs up as easily as a pleasure car. Is shorter than a horse-drawn wagon—turns in smaller space. Its brakes will hold any two to five-ton load. And your old pleasure-car engine does not work any harder or operate at any higher speed than usual.

Sold with the regulation motor truck guarantee—relieving you of all chance and putting it strictly up to the Traction Unit itself to "make good."

The Belt with the GRIP

DAWSON'S

"Lincona"

Balata Belting

In this belting you can secure the logical answer to the problem of belt slipping, stretching and breaking. **Lincona Balata** is made expressly to reduce these belt troubles to a minimum.

The making of Balata Belting is such that the Balata fluid permeates and becomes an integral part of the fibre. The exceptionally fine quality of gum used allows greater compression and consequently thinner belting, stronger wearing face, and less friction.

Lincona Balata Belting improves with age. It can be exposed to rain, snow and weather of all kinds without injury. If necessary it can be run in water. This alone should make **Lincona Balata** the mainstay of the lumber trade.

Write us about your specific belting needs or send for information and prices

The Lumber Demand Means the Maximum Cut for Your Mills

Are You Getting It?

Lumber prices have soared, the demand is great, and yet you hesitate to increase your output by the simple acquisition of a few good lights, which cost little, and yet multiply your profits.

Increase Your Lumber Output this Cut

Use

The Carbic Light

For Logging Operations, Bush Work, Camp Lighting and Saw Mill Use

The flare light is the ideal light for Logging, Bush Work and any outside work around the Mill. It is POSITIVE, SAFE, and

BRIGHT as DAYLIGHT

CARBIC
The new gas fuel.

The Carbic Flare Light burns the CARBIC CAKE, the new smokeless, safe, economical gas fuel. It gives a pure white light enabling the workman to do twice as much as possible under poor lighting.

Free Trial Offer is open to the Lumber Mills of Canada.

Any number of Carbic Lights placed on mill work FREE of all costs to prove that they are all they are claimed to be.

Test It Yourself
It Costs but a Post Card

Bunkhouse Lighting

A Carbic Generator System for the bunkhouse can be installed at small cost. Each Carbic Light will take the place of SIX oil lights. Does this not sound ECONOMY to the mill s overhead.

Remember

A Carbic Bunkhouse Generator System is placed FREE OF ALL COST in the camp and if it is not satisfactory, you can return it. No money is tied up.

Write to-day giving full size of buildings to be equipped. PRICES are LOWEST and SATISFACTION HIGHEST. **Guaranteed.**

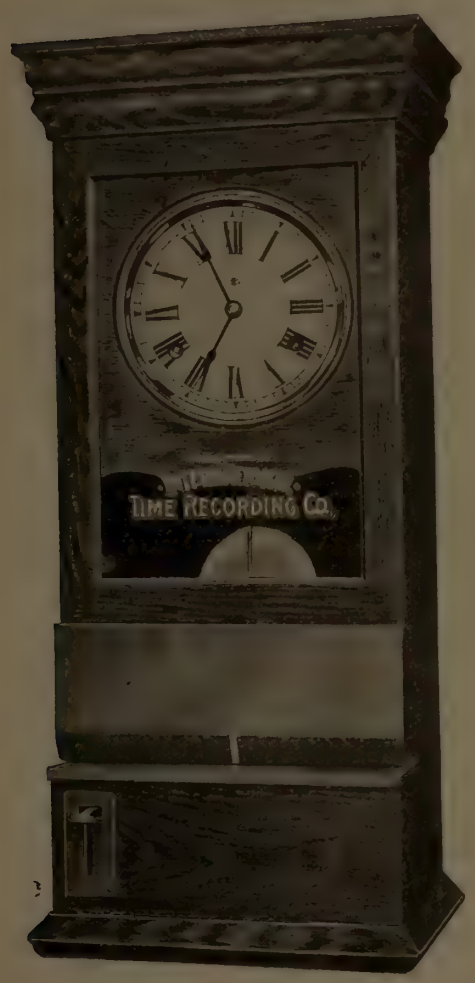
The Difference

This margin of card shows starting and stopping time of each job, in decimals

E	Elapsed Time	CLOCK RECORD	
D	2.2	S 15	9.2
		B 15	7.0
	1.9	S 15	11.1
		B 15	9.2
	.9	S 15	12.0
		B 15	11.1
	3.4	S 15	15.4
		B 15	12.0
	.6	S 15	16.0
		B 15	15.4



International Cost Recorder essential if you would have "control" of your factory burdens.

WHAT is the difference between the labor hours you buy and the "productive" hours in your plant—the answer is "Vital." How do you arrive at it?

By pencil records—surely not. They are unsafe, unreliable and out of date.

Your labor purchase should be printed.

Your labor cost of each job should be printed.

The difference is Vital—it is your factory burden. But be sure all records are printed. No forced balances.

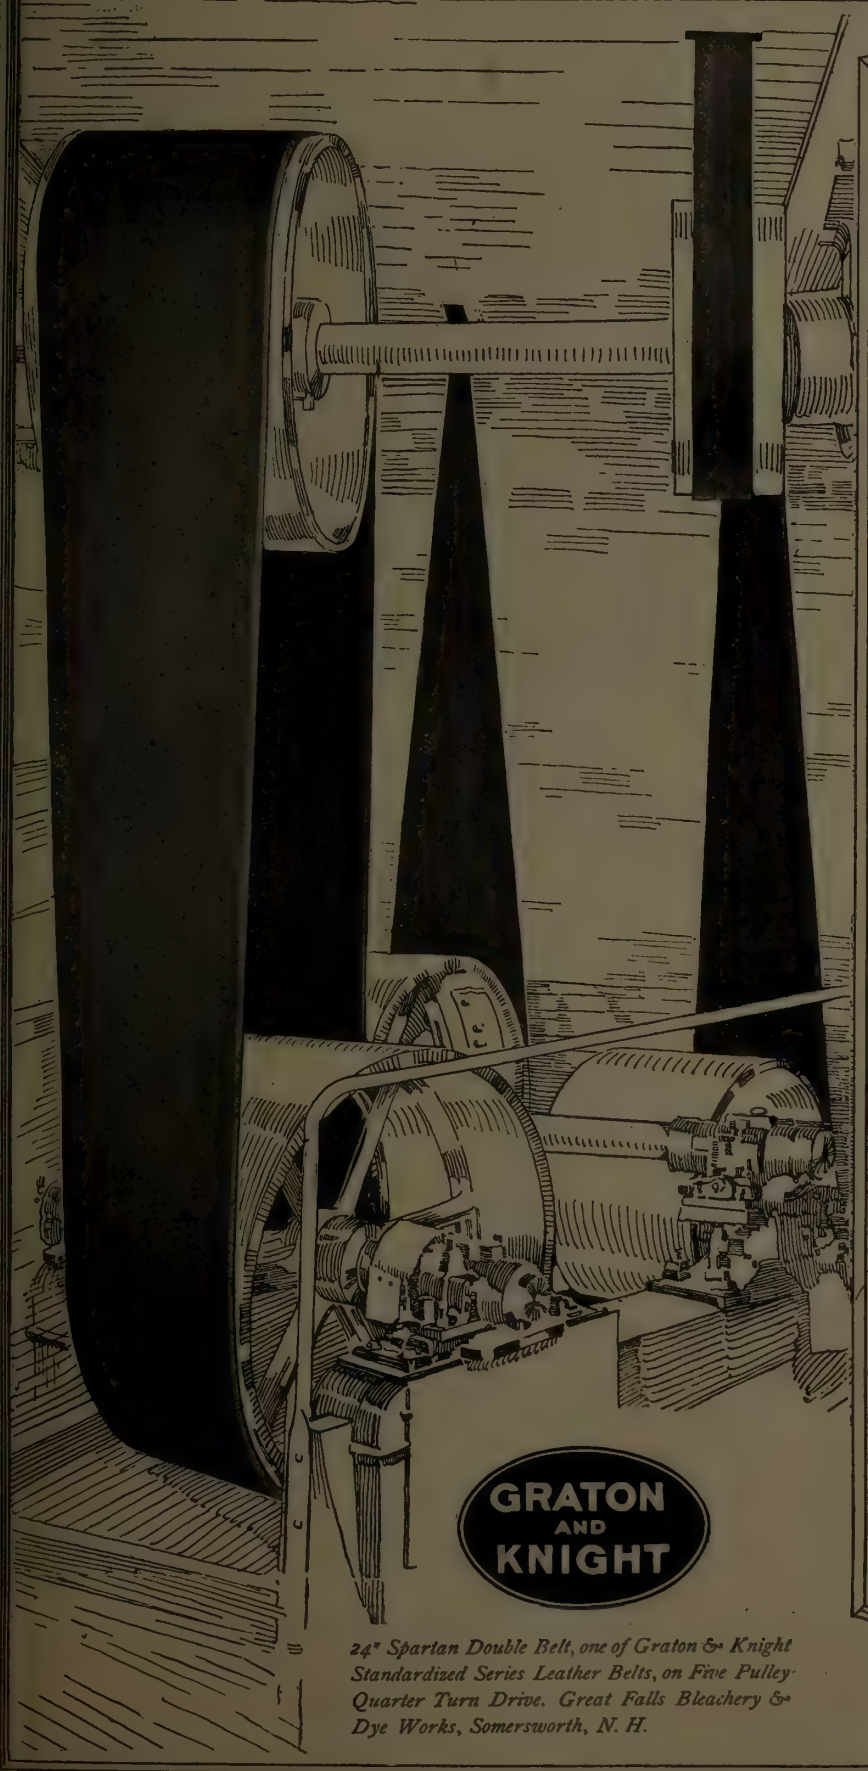
GRATON & KNIGHT

Standardized Series LEATHER BELTING

Tanned by us for belting use



24" Spartan Double Belt, one of Graton & Knight Standardized Series Leather Belts, on Five Pulley Quarter Turn Drive. Great Falls Bleachery & Dye Works, Somersworth, N. H.

It Begins in the Tannery

Leather is the standard belting material.

To us, the largest belting makers in the world, every possible belting material lies open for selection and use. But the belting experience of generations points to the unescapable fact that leather has the properties necessary to make good belting.

Leather that is properly tanned for belting is tough, flexible, durable and prehensile. It preserves the natural softness and mobility of the skin, ensuring an effective grip on the pulley surface.

We have standardized these requirements of perfectly tanned belt leather. The standard in each case is the highest **working** efficiency in the finished belt.

Since the market cannot supply tanned belt leather that continuously measures up to Graton & Knight Standards, we tan our own hides. Last year, we tanned 285,000 of them, in our own tannery. We tanned them for **belts.** We tanned them to definite and uniform standards of belting requirements.

This standardization of material is the foundation of Graton & Knight quality.

It makes the Standardization of Graton & Knight Belts an actual, practical thing.

Think what other standardized products have done for you—and consider the standardization of belting on that basis. Let us send you complete information on the subject.

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

Steel Filing Cabinets

UPRIGHT CONSTRUCTION

These Office Specialty Cabinets have reached the apex of Filing Cabinet manufacturing skill. Some of their outstanding features are Automatic Drawer Latches, Frictionless Drawer Slides, Detachable Ends, Sanitary Base, Double Wall construction throughout.

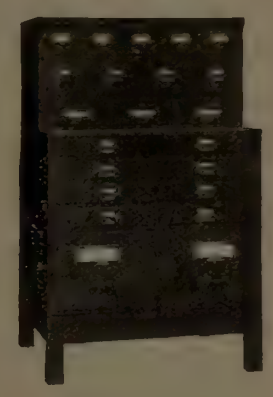
Wood Filing Cabinets

HORIZONTAL CONSTRUCTION

There are Office Specialty Filing Sections specially designed for every kind of business record—Letters, Bills, Invoices, Reports, Card Records, Cheques, Documents, Maps, and Drawings, File drawers give classified, compact arrangements for records.

Steel Record Safe

For protection of valuable records against the uncertain dangers of fire with extreme heat, the Office Specialty Record Safe gives exceptional service. Interior of Safe is of suitable dimensions to take Office Specialty Filing Sections of Wood or Steel, or adjustable Steel Shelves. For security, convenience and large capacity of records this safe is of exceptional value.



Steel Files

Office Specialty Steel Files are designed to give greater protection against fire and extreme heat. Drawers do not warp or stick under any climatic condition, but slide easily even when loaded to full capacity. If you prefer the kind of cabinet that will give longest service with security, choose Office Specialty STEEL.

Filing System Service

Thirty years' study of the filing problems of all kinds of businesses have enabled "Office Specialty" to offer a solution to all of YOUR problems. This System Service is offered free to customers. Let us serve you.

The Truck That Saves Its Cost Several Times Over in the Year

This truck is designed for lumber yards and planing mills, and will be found invaluable for loading and unloadng cars.

The front gearing is detachable, and may be used with eight or twelve hind gearings. It is a double-header, nuts on axles being kept tight with Steel Cotter Keys.

Oil cups on the wheels and the fact that there is no resetting of tires saves any amount of trouble.

The old wooden-wheeled truck is a back number in comparison with this. It will pay you to write for our general catalogue, which describes these trucks in detail, and pick out the style you want now.

Tudhope-Anderson Co., Limited

ORILLIA, ONT.

Garlock Packings

Are made in over two hundred styles and combinations to meet every known requirement. We will assume entire responsibility in selecting the proper styles and combinations of our packings to work successfully and economically under any stated condition; and if goods are not wholly satisfactory to purchaser we will refund promptly the cost of same. A card will bring our new catalog which fully describes our various styles of packings.

YOU NEED "LITTLE DAVID" FOR WOODEN SHIPBUILDING

— MORE WORK AND LESS WORRY —

THE "LITTLE DAVID" WOOD BORER

is the newest, the lightest and the most powerful.

Large Work Capacity
Easy to Operate
Low Air Consumption
Low Cost of Upkeep

Leading shipbuilding companies are standardizing "LITTLE DAVID" Tools because of their capacity for work, ready control and low air consumption. Other features which have turned the scale in favor of these tools are their simple construction and low upkeep costs.

Our No. 40 "LITTLE DAVID" Riveter is being widely used in wooden shipbuilding, for "horsing" in oakum, etc. This tool is a wonderful time-saver in this industry, where time now counts so much. Bulletins covering the "LITTLE DAVID" Tools, as well as prices, etc., will be gladly sent on request to your address. Write nearest branch office to-day.

"LITTLE DAVID" Tools for shipbuilding comprise Chipping and Riveting Hammers, Drills, Reamers, Grinders, Wood Borers, etc. The "LITTLE DAVID" Wood Borer shown above is made in three sizes, boring holes 1 in. to 4 in. The machine is reversible, and the largest size is about 10 lbs. lighter than other wood boring machines of the same capacity.

Another desirable tool is our CC-101 Drift Bolt Driver. With it, bolts can be driven in any position and at any angle. Two men with one of these machines, will drive a 1⅜" diameter bolt 5 ft. long, with 100 lbs. air pressure through oak with 1/16" drift at the rate of 5 ft. in 25 seconds. This is a great advance over driving these bolts with a sledge hammer. Our nearest branch will be pleased to give you full information.

Bond "Double-Sure" Transmission Machinery

Shaft Hangers—Couplings—Pulleys—Shafting—Pillow Blocks—Collars

THE PRICE is never right if the quality is wrong. QUALITY in power transmission equipment means correct design, based on long experience, and skill in manufacturing and finishing.

When you buy BOND transmission machinery you know the quality is right for we have had twenty-five years' experience.

And at the same time BOND transmission equipment can be bought at prices as low as are now charged for many inferior lines.

Chemicals

A Profitable Industry For Lumbermen

There is a handsome return on any investment in the chemical industry—particularly in the manufacture of those chemicals which we heretofore imported from Germany.

The industry is particularly attractive to lumbermen as many valuable chemicals are obtainable from wood waste by our complete wood distillation and chemical plant.

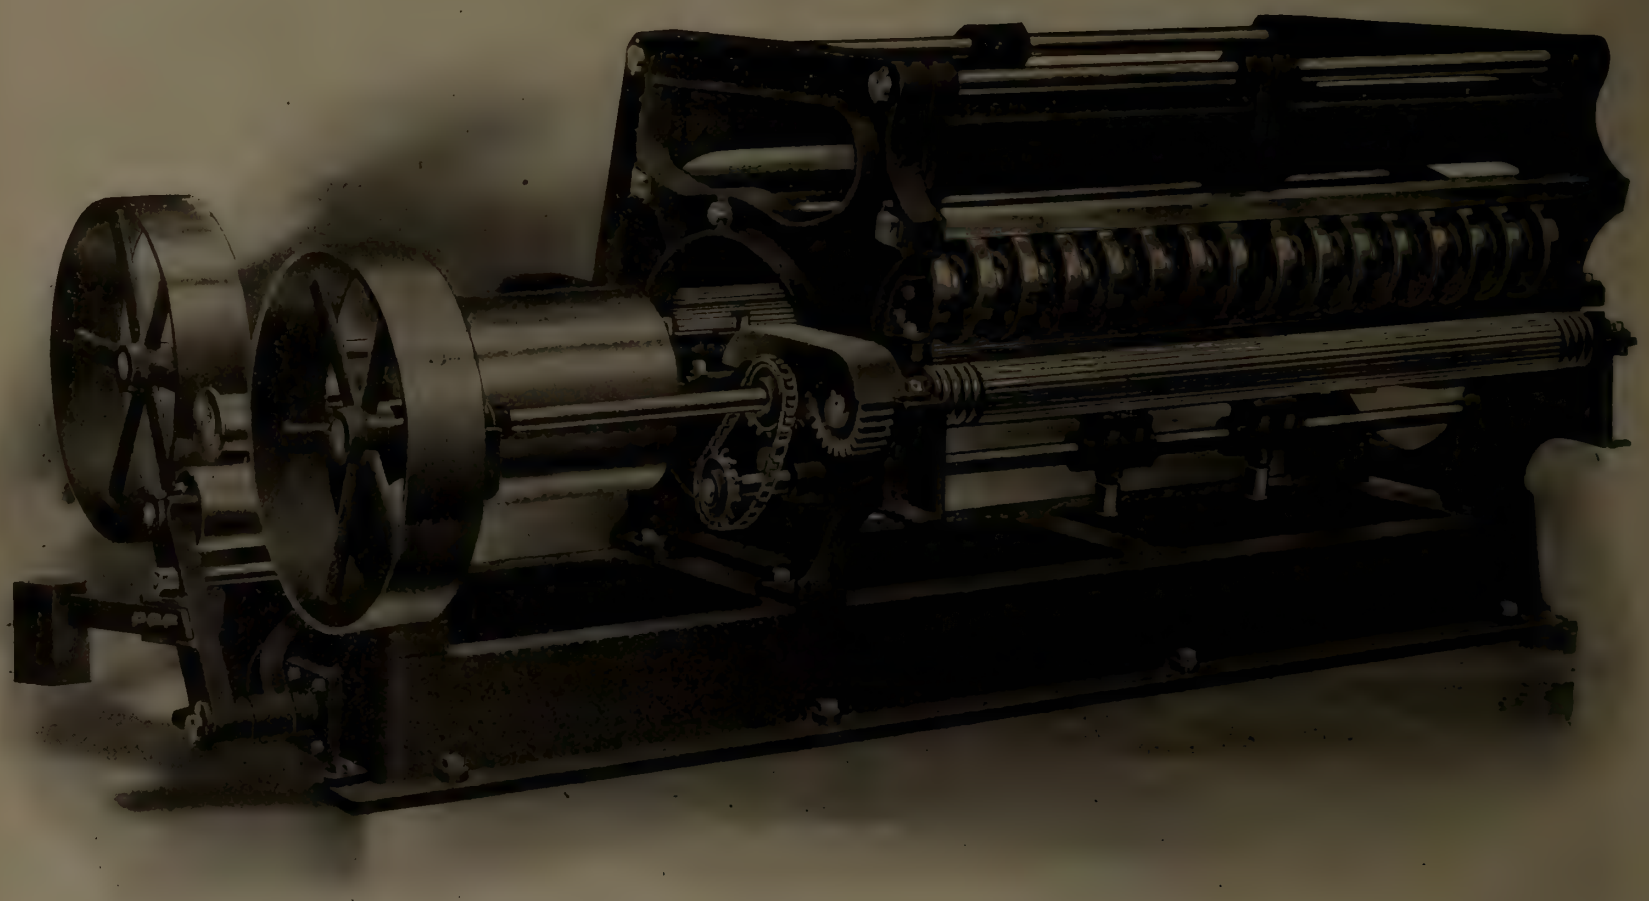
Heavy Duty Edger



These sturdy heavy duty edgers are built in sizes of 48 inch, 54 inch, 60 inch, 66 inch, 72 inch and 84 inch.

A feature in the construction of these machines is the casting of the base in one piece. This makes the machine self-contained and always in alignment.

We will be pleased to send you bulletin describing these edgers and giving their specifications.

The E. Long Manufacturing Co., Ltd.

Orillia - Ontario

BOB LONG
BRAND

Showing a section of the Glove cutting tables, where good liberal sizes are allowed for in making lumbermen's gloves and mittens.

Known from Coast to Coast

Glove operators' tables, where the gloves are put together with strong and careful sewing to stand the hard wear of the lumbermen.

KNOWING the requirements of the Lumbermen is a great advantage to the manufacturer in making suitable goods. Mr. Long, while a salesman, visited and sold the most prominent lumber camps from coast to coast and no doubt the trade mark "Bob Long" is to-day familiar to many of the operators. He studied and specialized on their requirements and can safely take credit for many of the improvements in the merchandise required by the lumbermen. In work gloves he improved the mitten with the chopper's thumb and exclusively designed a special glove for Riggers.

Your wholesaler can supply you with BOB LONG GLOVES, MITTENS, OVERALLS, SHIRTS, MOCCASINS and KNIT GOODS or it will be our pleasure to supply you direct and submit you samples on request. In any event insist on the "Bob Long" Brand and assure yourself of suitable goods built specially for your purpose.

Where Bob Long large overalls and clothing specialties for Lumbermen are made.

We Manufacture Everything We Sell

Where machinery is the big factor in making everything in Knit Goods better for the Lumberman.

DUNLOP
RUBBER HOSE

1894-1917 **Truly-Canadian**

Emphatic Endorsation by Highest Authorities

The masterly qualities of Dunlop Mill Fire Hose—the undeniable superiority under every test—are what secured for the Dunlop Line the approval of the Underwriters' Laboratories, Inc., Chicago. The approval takes the form of authorizing Dunlop to use the Underwriters' label, or, in other words, their O.K. mark, on **Dunlop Underwriters' Mill Fire Hose,** (Cotton Rubber Lined).

Underwriters do not have a habit of putting their approval on secondary products. They have a passion for going straight to the brand which has leadership written all over it. You can figure out for yourself the merit **Dunlop Underwriters' Mill Fire Hose** (Cotton Rubber Lined) must have to be so highly regarded by the Chicago Underwriters.

Nation-Wide Demand for "Dunlop"

Steam Hose is a line that cannot survive very long on make-believe virtues. Hence, the reason we feel proud that Dunlop Hose is in such nation-wide demand by critical observers of just what merits a Steam Hose must possess. Dunlop **"Gibraltar"** and Dunlop **"Peerless"** have a pretty good monopoly of favor with Steam Hose users.

Skilled Men Await Your Commands

Dunlop **"Hercules"** and **"Peerless"** are two brands of Water Hose famous for their exceptional durability and smooth waterways. we also manufacture hose for many other purposes. Our skilled men are ready to specialize on your order, no matter how particular you are. We welcome buyers who are hard to satisfy because we know full well such men will all the more appreciate the study we have given—and the apprenticeship we have served—to perfect the Dunlop product.

FOR SALE

Standing Timber

in Large or Small Blocks

and

Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery For Sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.
1 Double cylinder steam nigger, right hand.
1 Log Loader for right hand mill.
1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.
1 left-hand steam nigger.
1 Log-loader.
1 Endless chain jack ladder with two kickers complete for right and left hand mills.
2 Roger Gang Edgers for 8-in. cants and lumber.
1 Waterous double edger, 6 saws.
1 2-saw Trimmer.
1 20-ft. Slash Table.
1 16-ft. Revolving Slash Table.
1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.
1 Lath Mill with bolter.
2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.
5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
2 125 h.p. Water Wheels.
1 Upright Engine for sawdust conveyor.
1 10 h.p. Engine.
1 Wood Machine for 22-in. wood.
1 Edger for ripping dry lumber, installed.
1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

New Demurrage Rules Will Help Car Situation

The new demurrage rules which have been drawn up by the Board of Railway Commissioners for Canada, the chief features of which are published elsewhere in this issue, are of much importance to the lumber trade. Inasmuch as they are the result of a formal order by the Board, they will clear the air, and shippers and railway companies alike will know definitely where they stand. The order goes into effect on August 20th, and, according to its wording, is to continue in effect during the war. Briefly, the new rules have been purposely designed by the Board to speed up shipments by reducing the time during which freight cars are idle on account of various delays during loading and unloading. The principle of the rules is to let the shipper off easily when he is prompt in loading or unloading his cars, or even when he has been obliged, for one reason or another, to exceed the free time limit by a day or two; but as soon as he takes more than a reasonable time to load or unload, the demurrage charge against him commences to increase, and piles up to such an extent that it soon becomes far more profitable for him to use the utmost speed in releasing the cars than to be slow about it.

There are one or two important differences between the new rules and old ones. One day has been cut off the free time allowance in connection with shipments of lumber and coal. Formerly, three days' free time was permitted. Now only two days are allowed. Under the old rules which were in effect previous to January 1st, 1917, only two days' free time was allowed and then the charges were $1 for the first day, $1 for the second day, $3 for the third day and $5 for the fourth and each succeeding day. After May 30th the old rules were reverted to. After August 20th there will only be two days of free time, and on the third day a demurrage charge of $1 will be imposed. On the fourth day the charge will be $2, on the fifth day $3, on the sixth day $4, and on the seventh and each succeeding day $5.

It is plainly evident that the Board has desired to put into effect a set of rules which will reduce the delays in loading and unloading. The new rules unquestionably will have this effect, and, to that extent, shippers will be benefited, as their interests are closely affected by the ability of the railway companies to furnish cars. With fewer delays in loading and unloading, more cars will be available. The new order is to be commenced on this ground. Although lumber shippers naturally will be inclined to object to the reduction in the free time allowance, they stand to be considerably benefited by the greater number of cars they will be able to obtain under the new rules, and if a reasonable effort is made by all parties to co-operate in speeding up shipment, there will be much good come out of the new rules. A few lumbermen who have already expressed their opinions upon the change are inclined to take this view and to say that the new rules, with the exception of the increased charges and reduced free time are commendable, in fact are workable and good. They admit that the rules are likely to relieve the car shortage to an appreciable extent, without working much hardship upon those who seriously attempt to release their cars promptly.

Pulpwood's Increased Value Stimulating Fire Prevention

The great increase that has taken place lately in the value of pulpwood is responsible for quite a revolution in the general situation of the pulpwood industry and brings to light some interesting considerations. From two different sources we have recently received expressions of opinion upon this subject. Mr. R. O. Sweezey, who is well known to readers of the Canada Lumberman on account of his extensive experience in the lumber and pulpwood industries of northern Ontario and Quebec, writing to the Canada Lumberman recently, says:—"I have just returned from a trip in the north country, where I was interested to note that the high prices for pulpwood are acting as the best argument for conservation that has ever been put forth regarding Canadian forests. The settler no longer sets fire recklessly to his standing timber because he now gets a profit, not only upon his labor, but also upon the value of the timber as it stands. I trust that interference with prices of pulp and paper will not lower the price of wood sufficiently to cause the settler to revert to his former practice of burning his standing timber, instead of cutting and selling. This year the settler is receiving from $6.50 to $8 a cord for his rough wood at the railway. In former years he only received $3 a cord."

The situation as outlined by Mr. Sweezey is important, both in regard to its effect upon the pulpwood industry and because of its bearing upon the settlement problem in the north. In regard to the pulpwood industry, the situation is simply one of an economic nature relating chiefly to the problem of supply and demand. The settlement feature of the matter, however, has a much wider bearing, and while Mr. Sweezey is incliined to look upon it as a possible promoter of conservation, there is a danger connected with the situation which, if not handled cautiously and vigorously by provincial governments, may produce bad results. No doubt the settlers already in the country who cut and sell their pulpwood will be a far smaller fire risk than they have been in the past when they burned their timber, and it is possible that during the present summer the north country may escape the great conflagrations that have so frequently swept over it and have in practically all cases been caused by careless settlers.

The dangerous feature of the situation is that which relates to the land hunger of a certain class of individuals who have the reputation of taking out fraudulent homesteading permits so as to strip the country of its timber and then move elsewhere. This subject has been dealt with frequently in the Canada Lumberman, and so far as Ontario is concerned the last reference to it was a report of the remarks made by the Minister of Lands, Forests and Mines in reply to a deputation in November, 1916. The Hon. Mr. Ferguson then said that, so long as he was head of the Department, political influence would be of no avail in obtaining homsteading permits, or appointments to the Forest ranging staff of the department. Other provincial governments have laid down similar policies from time to time, and while we have no disposition to make statements either pro or con upon this subject at present, it is timely to bring it up because of the situation created by the high price of pulpwood.

That this situation is taken very seriously by those who are most

active in the preservation of Canadian forests is shown by an article in a recent issue of the Canadian Forestry Journal, which says:—"Until homesteading and timber licensing are completely removed from the vicious influence of political pull, various administrations will continue to play ducks and drakes with the public resources of land and timber.

"In violence to the legal regulations and every consideration of the public good, hundreds of "homesteading" applications are granted because of political pressure and only the lack of publicity for such transactions can present a general protest.

"None denies the right of a land-hungry citizen applying to his Government for a free grant. But in these days when spruce for pulpwood commands the high price of eight dollars a cord delivered at the railroad, it is significant how many persons are getting 'land hungry' and cannot be persuaded to take land that is not densely covered with pulp wood. Offer most of the applicants a homestead of cleared land, ready for the plow, and they would turn it down.

"It is understood that the Lands Department of the Government of New Brunswick is overloaded with 'Homestead' applications. Traditional practice in some parts of the Dominion has granted these requests as freely as they arrived. So-called settlers seeking some cheap and accessible timber, when the market is thriving, are allowed to take these generous slices out of a licensed area. Indifferent to the effects of fire, careless as to the fate of the main stand, they form one of the most dangerous menaces with which the protective staffs have to deal. Often the spruce lands are quite unfit for agriculture, nor has the settler in many instanc s any intention to try a permanent residence. He clean cuts the standing timber, leaves no provision for natural reproduction of trees, creates a fire hazard and finally moves off with some easy money.

"The straightforward policy is to refuse homesteading applications except for land definitely proven as agricultural and where it lies in sufficient volume to maintain a community and its social machinery. No citizen ought to be allowed to locate himself and family in a mere 'pocket' of good soil, isolated from schools, churches, and markets. Where applicants can be shown to be mere timber grafters, their cases should receive short shrift."

Anarchy in the Pacific Coast Industry

It is a little difficult for people living in eastern Canada to appreciate the proportions and the gravity of the industrial crisis that is developing on the Pacific Coast on account of the demands of the Industrial Workers of the World. About all that has been learned so far in eastern Canada is that there is a strike in progress among the employees in many of the saw and shingle mills of the coast and that the plants have been closed down. In ordinary times the declaration of a strike calls only for the consideration of the rights of the individuals immediately concerned. The inconvenience to the consumer has little bearing upon the result, and, the great body of the people take an interest in the affair only as a matter of news and discuss it so long as it is featured on the front pages of their daily newspapers. But there is something far more serious going on today on the Pacific Coast, which concerns not only employers and employees, but the whole nation and its efforts to furnish materials necessary for carrying on the war.

The Industrial Workers of the World have established for themselves a reputation for lawlessness and greed which ought to be put down ruthlessly, even in times of peace. Their great desire is to stir up trouble. They represent all that many of us have come to think is included in the name of anarchy. Their aim is to disturb and tear down the industrial fabric, and they impress their members to aid them by promises that their industrial situation will be improved in the process of destruction. Their method of procedure is that of anarchy in its essence. When they determine upon a certain set of demands that are to be made upon employers they issue an ultimatum, and when their orders are not complied with they strike. They make no use of arbitration or conciliation of any description. Simply, the employer has to accept the choice of compliance with their demands or a fight; and what a fight means against such unscrupulous opponents is becoming evident to the industries of the west coast today.

The agitators who are in control of this movement are inciting their members to acts of violence which can be dealt with only in one way. Their actions are treason in its most sinister form and need to be handled as such. They stop short of nothing which they imagine will help them in obtaining their end. Destruction of mills is their chief means of cowing employers. Today they are going still further. In the southwestern States they are making demands upon the agricultural community and threatening to withdraw labor from the fields at a time when the crops are ready to be harvested, and when the very life of the nation and the success of its efforts in the war depend upon the harvesting of all that has been produced. They are threatening to invade the great lumber producing industry of the southern States.

The arrogance of this body is leading them to extremes which must surely bring about their downfall. In Canada, we believe that the situation, if it reaches such a climax as it has already reached in the United States, will be dealt with as we have suggested above, and that those who are responsible for anything in the form of violence will be dealt with as traitors. We have seen enough of the results of the war in Canada to appreciate this point better probably than those across the line, and agitators in this country are not so likely to go to great extremes. If they do however, they must be taken in hand without delay and examples made of them which will put an end to all such treason.

The Industrial Workers of the World have made sufficient trouble in the western States to warrant the Canadian Government in stamping out their work in Canada at once, without waiting for an example from across the line. If the Government of the United States had already had the experience that the Canadian Government has had in connection with the war, there is no doubt that this organization would have been broken up long ago. The very fact that it has been treated leniently so far is adding to its arrogance. It has even gone so far as to send a telegraphic ultimatum to the President of the United States, threatening a general strike of miners and harvest workers if its demands are not complied with. The organization seems to have concluded that Democracy, instead of being the government of the people by the people, is the government of the people by the lawless few. Undoubtedly its course has been dictated to some extent by a false comparison between the situation which it has produced and that which was produced some time ago by ordinary industrial forces when the railway employees of the United States issued an ultimatum to Congress that if its demands were not complied with within a certain time they would call a strike that would paralyze the traffic of the country. The situation today, however, is very different from what it then was and the Government of the United States will be justified, in the minds of all who have the interests of the country at heart, in arresting the leaders of this industrial uprising and treating them as enemies of the country, trying them for treason and meeting out such punishment as the evidence warrants, even to the extent of the death penalty where it is shown that they mave been exciting members to violence or destruction.

As to the situation which will develop out of the strike from an industrial point of view, and its effect upon the markets, nothing definite can yet be said. Already a scarcity of British Columbia lumber and shingles is being felt in eastern Canada and west coast products are similarly scarce in the eastern States. The outcome, however, will depend entirely upon the vigor of the Government in dealing with the movement, for, apparently its leaders intend to go to the end of their tether and to cripple the producing activities of the western industry, or even to destroy its productiveness altogether, if they are permitted to do so.

White Pine's Peculiar Market Conditions

Without attempting to trace the market history of white pine lumber in Canada and the Northern States, it is possible to state in general terms that its advance in price for some years was coincident with its gradually increasing scarcity, and that this advance finally was checked by the entry into its markets of competing woods from the southern States and the Pacific coast, so that in late years its market price has not been regulated either by supply or demand. This situation is the subject of a short article which appeared recently in the Journal of Forestry, written by K. J. Braden, who draws attention particularly to the tax on the lumber consumer in the lake States which results from the cost of transportation. Some of Mr. Braden's points and figures are interesting. The growing scarcity of stumpage in the United States, he says, is emphasized in the steady increase in mill prices of lumber from 1900 to 1908. In 1900 the average mill price of thirty species of lumber was $11.13 per thousand feet. In 1908 this had increased to $15.37 per thousand feet, an advance of 38 per cent. in eight years. Some of the kinds of lumber and their increases in mill price were as follows:—White pine, 43.2; oak, 54.1; cedar, 65.3; western white pine, 54.9; walnut, 16; yellow poplar, 80.3; spruce, 44.2.

These advances in price, taken as a whole, indicate that the increasing use of wood substitutes cannot be expected to halt effectually the advance in wood prices, although it cannot be doubted that the increase would be greater in the absence of such substitutes. An analysis of the increases, however, furnishes evidence of competition between species. Yellow poplar and cedar, which have special uses for which it is difficult to substitute another species show the greatest advance in price. Walnut, which had already reached a very high price in 1900 shows a very small increase, and is evidently subject to the competition of cheaper woods. The comparatively small advance in white pine must be ascribed to its sale in competition with western and southern pines, rather than to any large amount available. The presence of all western and southern pines in the market throughout the lake States is taken to be a conclusive evidence of the scarcity of white pine stumpage. Twenty-five years ago, white pine controlled the market in this district and the price was dependent upon the cost of production and distribution. The price of stumpage advanced as the supply decreased, until the southern pines were able to replace it to a large extent. As yellow pine becomes less available the western species are gradually taking its place. Although these competing woods are no better suited than white pine for the purposes to which they are put, except for special use as construction timbers, their large available supply sets a value for white pine and limits its advance in price, so that the growing scarcity of white pine does not increase its price in proportion, but results in an increased demand for the competing woods.

Keeping these points in mind the writer then discusses the tax upon the consumer resulting from compulsory use of substitutes on which a heavy freight rate is necessary. Using the Minneapolis market as an example he states that the following are average rates per thousand feet from the different producing regions: Southern pine, $8; Douglas fir $11.25; western pine, $8.75; Idaho white pine, $8; northern pine, $1.40. Every thousand feet of western and southern pine received at Minneapolis, therefore, costs the consumer much more in freight charges than the same amount of lumber would if shipped from the northern pine producing region, and this excess may be fairly regarded as a premium paid to the railroads for the privilege of using certain kinds of lumber which are in most cases no better suited for the purpose than the white pine. For the different species the premium per thousand feet works out as follows:—Southern pine, $6.60; Douglas fir, $9.85; western pine, $7.35; Idaho white pine, $6.60.

While the object of the article is to point out that Minnesota might profitably place a property tax upon its people for forestry purposes, in order to develop a home-grown supply of pine, the article is chiefly interesting to Canadian readers because of the way in which it illustrates the cause underlying the fact that white pine has apparently been regulated by conditions quite apart from those prevailing in connection with other lumber stocks.

Editorial Short Lengths

The Canadian news print enquiry is held up, pending the report of Geoffrey Clarkson, of Toronto, who was the accountant selected to go through the books at the various news print plants to verify the statements of cost and profits submitted to Commissioner R. A. Pringle, K.C. He has about twenty expert "statisticians" on the job, and the work is proceeding as rapidly as possible. But it will be hampered considerably by the appointment of the new commission to investigate profits on foodstuffs. Mr. Clarkson has been made a member of this commission, and he will have to divide his time between this and the news print probe. George F. Henderson, K.C., one of the counsel for the manufacturers in the paper enquiry, is the chairman of the foodstuffs commission, so that his attention will also be detracted from the paper investigation for some time. It is not likely that a report from Mr. Clarkson will be received before the latter part of August, and it is expected that the commissioner will then ask for a further extension of the order-in-council fixing the price of news print to give him time to compile his report.

The Forestry Branch of the Department of Lands, Forests and Mines of the Province of Ontario has issued a placard to be posted throughout the forest areas of Ontario, the object of which is to reduce the number of forest fires. The placard is worded as follows:

"Look before you leave. See that your fire's out. Save your forest; you may want to camp again." The department has forwarded 25,000 of these cards to the chief rangers of Northern Ontario, who will see that they are posted in conspicuous places along canoe routes and roads in the mining and tourist country of the north. The card is 18 inches by 12 inches. The letters are black and printed on a yellow background and can be read without difficulty at a distance of 50 yards. The cards are being distributed in order to win the co-operation of campers and others in order that disastrous fires may be avoided.

This year owners of lumber districts are required to pay a tax of one cent an acre to the government for expenses of guarding against fire.

The Department has also prepared a number of notices printed in large black type upon white linen which will be attached to trees, camp buildings, etc., throughout the north country. One of these notices is worded as follows:—"Your business and pleasure here will be injured by forest fires. Put your camp fires out. Do not drop lighted matches or burning tobacco. Big fires come from small ones. Penalty up to $50. Report fires to ———— Fire Ranger ———— address." Another of the linen notices is worded as follows:—"Do not burn your slash without a permit from a fire ranger———— Fire Ranger ————Address." The latter notice will be posted up in logging districts, in order to warn bush operators against the great danger of indiscriminate slash burning.

A despatch from Great Britain states that the government of Sweden has lifted the embargo on the shipment of chemical pulp from that country to England. This embargo had been imposed in retaliation for the embargo on the shipments of coal and other commodities from England to Sweden. It is not thought that the removal of the embargo will have any considerable effect upon trade, as there is a serious shortage of vessels and such as are available are being loaded with more important and valuable cargoes. England, moreover, permits the importation of chemical pulp only to the extent of one-quarter of the quantity imported in 1914.

New Rules Ordered for Car Demurrage

First Two Days Free; One Dollar for Third Day; Two, Three and Four Dollars for Succeeding Days; Five Dollars for Seventh and Following Days

Judgment has been given by the Board of Railway Commissioners for Canada in the matter of the application of the railway companies for approval of the revised code of car demurrage rules. The judgment is signed by the chief commissioner, Sir H. L. Drayton, and agreed to by the other commissioners. It goes into effect on August 20. Great interest was taken in this matter by shippers and railway companies, and the board held hearings at Victoria, Vancouver, Nelson, B.C.; Calgary, Regina, Edmonton, Saskatoon, Winnipeg, Fort William, Toronto, Montreal, and Ottawa. The judgment is given in the form of a consideration of the proposed rules, one by one, and a statement as to whether they are to be adopted or altered. The new rules, in the form in which they will now be effective, include the following:

Notification.—(a) Notice shall be sent or given consignee by carriers' agent in writing, or as otherwise agreed to in writing by carrier and consignee, with all despatch after arrival of car and billing; such notice to contain point of shipment, car initials and number, and the contents, also the initials and number of the original car if transhipped in transit. If notice is mailed, consignee shall be held to have been notified at 7 o'clock a.m. following the date of mailing.

The carrier shall notify the consignee or his carter on application where his car has been placed for unloading. Any time within the free time allowance lost to the consignee in so doing for which the carrier is responsible shall be added to the free time allowance.

(b) Delivery of cars upon private sidings or industrial interchange tracks shall constitute notification thereof to consignee. If such delivery cannot be made owing to such tracks being fully occupied, or from any other cause beyond the control of the carrier, written notice of readiness so as to deliver shall be given, and shall constitute notification to the consignee for the purposes of these rules, in which case the free time shall be computed from 7 a.m. of the first following day.

(c) In all cases where notice is required, the removal of any part of the contents of the car by consignee shall be considered notice thereof.

Free Time Allowance.—(a) Twenty-four hours (one day) after notice of arrival (exclusive of Sundays and legal holidays) will be allowed for any or all of the following purposes, if necessary:

1. For clearing customs.
2. In the case of consignees not served by private sidings or industrial interchange tracks, to give orders for special placement.
3. For reconsignment or reshipment in same car.
4. When cars are held in transit for inspection or grading; stopped in transit to complete loading, to partly unload, or to partly unload or partly reload, when such privilege of stopping in transit is allowed in the tariffs of the carriers.
5. If the 24 hours allowed for the above-mentioned purposes are exceeded, demurrage shall be charged.

(b) Forty-eight hours (two days) free time (exclusive of Sundays and legal holidays) will be allowed for loading or unloading all commodities.

Exceptions.—Five days' free time shall be allowed at Montreal and at tidewater ports for unloading lumber and hay for export.

Manufacturers, lumbermen, miners, contractors, and others who have their own motive power and handle cars for themselves or others, shall be granted additional allowance of the time necessary for them to do the switching to and from the designated interchange tracks, not to exceed 24 hours.

Computing Time.—(a) On cars held for loading, time will be computed from the first 7 a.m. after placement until loading is completed, and proper billing instructions furnished.

(b) On cars held for disposal, time will be computed from the first 7 a.m. after the day on which notice of arrival is sent, or given to the consignee.

(c) On cars held for unloading, time will be computed from the first 7 a.m. following placement on public delivery tracks, provided notice of arrival has been sent, or given to the consignee.

(d) On cars to be unloaded on private delivery tracks, time will be computed from the first 7 a.m. after actual or constructive placement on such tracks.

(e) On cars to be loaded or unloaded on tracks of manufacturers, lumbermen, miners, contractors, or others, who have their own motive power and handle cars for themselves or others, time will be computed from the first 7 a.m. following actual or constructive placement on the interchange tracks until returned thereto. Cars returned loaded will not be recorded released until billing instructions and other necessary data furnished.

(f) When empty cars are placed for loading on orders, and are not used, demurrage will be charged from the first 7 a.m. after placement until released without any free time allowance.

(g) When an empty foreign car is placed for loading via a specific route so as to protect ownership of car, according to Car Service Rules, and same is not so loaded, demurrage will be charged until car is unloaded, without any free time allowance.

(h) Time lost to the shipper or consignee through switching of cars, or any other cause for which the railway company is responsible, shall be added to the free time allowance.

(i) In computing free time or demurrage time, Sundays and legal holidays will be excluded. The exemption for holidays does not include half-holidays.

Weather Interference.—If wet or inclement weather, according to local conditions, renders loading or unloading impracticable during business hours, or exposes the goods to damage, the free time allowance shall be extended so as to give the full free time of suitable weather. But if the cars are not loaded or unloaded within the first 48 hours of suitable weather no additional free time shall be allowed.

Bunching.—(a) Cars for loading.—When, by reason of delay or irregularity of the carrier in filling orders, cars are bunched and placed for loading in accumulated numbers in excess of daily orders, the shipper shall be allowed such free time for loading as he would have been entitled to had the cars been placed for loading as ordered.

(b) Cars for unloading or reconsigning.—When, as the result of the act of neglect of any carrier, cars destined for one consignee at one point are bunched at originating point, in transit, or at destination, and delivered by the carrier line in accumulated numbers in excess of daily shipments, the consignee shall be allowed such free time as he would have been entitled to had the cars been delivered in accordance with the daily rate of shipment. Claim to be presented to carrier's agent within 15 days.

Placement.—(a) "Actual placement" is made when a car is placed in an accessible position for loading or unloading.

(b) Deilvery of cars to private sidings or industrial interchange tracks shall be considered to have been made when such cars have been placed thereon, or would have been placed but for some condition for which the consignee in writing is responsible. When cars cannot be so placed, the carrier's agent shall notify the consignee that he has been unable to deliver cars because of the condition of the private siding, or interchange tracks, or because of other conditions attributable to the consignee. This will be considered "constructive placement." This will apply to such cars which consignees located on switching line are unable to receive, and which, for that reason, the switching line is unable to receive from the carrier line. The carrier line will advise the switching line of point of shipment, car initials and number, contents, and consignee, and, if transferred in trasit, the initials and number of the original car. The switching line will notify consignee and put such cars under constructive placement.

(c) When delivery cannot be made on specially-designated public delivery tracks, on account of such tracks being fully occupied, or from any other cause beyond the control of the carrier, the carrier shall send or give the consignee notice in writing, or as otherwise agreed to by carrier and consignee, of its intention to make delivery at the nearest point available, to the consignee, naming the point. Such delivery shall be made, unless the consignee shall before delivery indicate a preferred available point, in which case the preferred delivery shall be made.

Customs or Inspection Delays.—Demurrage charges shall not be collected from the consignee for any delays for which government or railway officials may be responsible.

Charge.—After the expiration of the free time allowed demurrage shall be charged during the war on the following scale:

First and second days to be free.

For the third day a charge of $1 to be made.

For the fourth day a charge of $2 to be made.

For the fifth day a charge of $3 to be made.

For the sixth day a charge of $4 to be made.

For the seventh day and all days thereafter a charge of $5 per day to be made.

Non-payment.—If payment of demurrage charges properly due on cars held on public delivery tracks be refused, delivery of only the car or cars on which such charges are due shall be withheld, by means of sealing or locking, or by placing where such cars shall not be accessible.

If the owner or users of private tracks, or the owners of industrial tracks, refuse to pay any charges which may already be due, delivery of cars to such sidings or tracks shall be suspended, and delivery shall be made on any availabl public team track until such charges have been paid.

Chief Commissioner's Comment on Changes

In the course of the judgment the chief commissioner comments upon each rule and the changes which he has made in them. Some of

these comments are important and interesting to lumbermen. Among the comments made were the following:

"Consignees are entitled to information as to the exact spotting of their cars. I am of opinion that if there is any delay in giving this information, for which the carrier is responsible, the time lost should be added to free time allowance." This is provided for in Rule 2, Section A, of the new rules, which is one of the sections amended by the judgment.

"The adoption of the free time allowance rule proposed by the railways would work a very radical change, in that free time allowed for all public team-track delivery would be shortened by 24 hours. The rule submitted is, in effect, the American rule; . . . conditions in Canada do not permit the adoption of this proposed rule. While the C.P.R. can place cars on team-track without first receiving any specific order, owing to the fact that their terminals are arranged in such a manner as to permit this, the Grand Trunk cannot. . . . The 24 hours' time now allowed, in my view, must be continued. It is impracticable to have one rule for the C.P.R. and another rule for the G.T.R.; and the general conditions forbid the adoption of the rule, as submitted, in Canada in this regard. . . . In my view, cars would not be the more speedily released. The only effect would be to enable the railways to exact further tolls from the public. On the other hand, the adoption of the rule would be prone to add to existing congestion."

"If placement orders are held over until after the first 24 hours, although the unloading itself may not be delayed, terminal congestion is, nevertheless, increased, as a fresh lot of cars have been brought into the terminal in the second 24 hours, necessitating more switching and more shunting."

"Cars cannot be unloaded either on Sundays or on legal holidays. To include them in demurrage time is merely adding an extra penalty for an ordinary default. There can be no justification for it. Ordinary default will be fully covered by the scale of demurrage to be adopted."

"There are cases, and always will be cases, where the greatest diligence is sometimes attended with delay. The man who is trying to do his best ought not to be unduly penalized. I agree that the greatest number of delays to cars, of necessity, occur on the day first after the free time; but I am firmly convinced that the delays which are really unnecessary, many instances of which have been brought before the board, are delays which extend until well beyond this first day and for a week and more afterwards. . . . The holding of a car on the third day ought not to be considered in the light of a penalty. Some charge, of course, has to be made, but to my mind there is no doubt that a heavier charge ought to be made for a delay on the sixth day than for a delay on the third. The object, as I see it, is not to penalize the man who is desiring to do business as quickly as he can, but to penalize the man who is persistently holding cars over the prescribed free period or turning them into temporary warehouses."

"The demurrage tariff included in the judgment ought to release cars quickly. Under it the car held for seven days would be subject to a charge of $15, as against $10 under the American tariff, although for three days, which is the period covering most cars, the charge would be but $1, as against $2 in the States, and for four days $3, as against $4."

"It may be thought that the tariff is specially severe and ought never to be applied. I am confident that, with diligence, all cars can be unloaded—if not within three, certainly within four days; and, if by reason of some special circumstance, the consignees may find themselves in an unfortunate position, it is infinitely better that the individual should suffer rather than the whole. Traffic must be speeded up, and coal must be got into the country."

The judgment concludes with a discussion of the problems of reciprocal and average demurrage, and states that the congestion of last winter worked similar and perhaps greater loss to the railway companies than that to shippers and consignees. "In Ontario, as a result of the congestion in February," the judgment says, "the freight business of the Canadian Pacific was actually 15.58 per cent. less than the business of February, 1916, while the Grand Trunk's decrease amounted to no less than 39.37 per cent. The decreases in the Quebec district were greater, the Canadian Pacific's being 25.82 per cent. and the Grand Trunk's 48.5 per cent.

These losses occurred at a time when a tremendous amount of freight was offered both systems, yet the actual performance of the companies resulted in loss of freight earnings. The possible loss to the railway companies under reciprocal demurrage, the judgment says, "would be entirely infinitesimal as compared to the actual losses incurred. The incentive to service which a demurrage penalty would afford would be indeed small as compared to the incentive the companies would already be under."

The proper time to deal with the questions of reciprocal and average demurrage was not at present. They ought to be left open for consideration by the board with open mind, after the war, and when conditions are more normal. In conclusion, the judgment states that the board will endeavor to ascertain whether the adoption of reciprocal demurrage or average demurrage has worked real benefit in places where they have been tried.

Details of English Embargo Relaxation

A cablegram received recently in regard to the relaxation of restrictions on the import of timber into Great Britain from North America outlines the situation as follows:—

(1) Neutral sailers: Timber may be imported from Canada and the United States under provisions of an import license. (2) Deck loads: General license granted by Department of Import Restrictions for import of timber as deck cargo from Canada and the United States. In this case unnecessary for importers to apply for licenses. (3) Prices: The order which limits prices of imported soft wood to those current during last week of January, 1917, is not to apply to timber imported from Canada and the United States after July 19, 1917. Timber so imported may be sold by importers at cost price delivered to store, plus 10 per cent. provided price so calculated does not exceed by one-third the price current during last week of January, 1917, for soft wood of similar quality in same locality.

Northcliffe Paper Going to U. S. Consumers

The American Newspaper Publishers' Association, through its paper committee, has concluded negotiations with the Lord Northcliffe mill interests, and has contracted for the mills' entire output in Newfoundland, to be sold to United States publishers, without contract, at prices claimed to be lower than the market quotations. A. G. McIntyre, of the paper committee, states that delivery of the paper to publishers can be made within a short time.

"We can practically guarantee delivery from Newfoundland to seaboard in five days," he says. "The reason for this expedition is that we have the necessary ships to transport the paper. It would have been a much more difficult undertaking if this were not the case."

The criticism has been made that only paper in a 69½ size, or the size of the London Daily Mail, can be furnished. "This," Mr. McIntyre says, "is not the case. The Northcliffe plant can furnish any of the standard American sizes. At the present time we have approximately 15,000 tons of news print stored up at Newfoundland, and, of course, some of this is in sizes that cannot be utilized by American publishers with their present mechanical equipment. The production of the mills, we estimate, will be about 210 tons per day."

B. C. Forest Fires Take Toll of Life

According to the latest reports received from British Columbia, most of the forest fires have been got under control, but not before some of them resulted in loss of life and extensive loss of property.

Eight men are known to have perished in a fire that swept the Spruce River Valley, fifteen miles north of Fernie. Sixty-odd men and about 20 teams were trapped in one of the Elk Lumber Company's camps situated in a blind valley and the loss of life occurred at this point. A large quantity of logs, the logging railway, the camp building and equipment, the supplies and a number of horses were destroyed.

Forest fires were reported in the upper valley of the Kootenay River, about 30 miles west of Cranbrook.

Other fires were reported in the Creston Valley, in the Flathead Valley, near Corbin and near Trail, B.C., in addition to a number of smaller fires at other points.

No Fifteen Per Cent Rate Advance in U. S.

The Interstate Commerce Commission of the United States have postponed until October 1st, 1918, the proposed 15 per cent, increase in freight rates. The commission announced: "We are led to the conclusion that no condition of emergency exists as to the Western and Southwestern carriers, which would justify an increase in the rates to become effective."

The commission declared its willingness to meet any situation which may develop in which the railroads' fears are realized.

Shipbuilding Superintendent

Some responsible parties desire to get in touch with a capable superintendent to take charge of the building of small steamships for a company which is going into this work in France. There would be a splendid opening for a man with boat-building experience, speaking both languages. Further information by addressing "Ship-Builder," care of "Canada Lumberman," Toronto.

Wooden Shingles Invariably the Best

Comparison with Composition Products Shows them to be Superior—a Useful Analysis for Retailers to Bear in Mind

The campaign waged by manufacturers of various kinds of patent roofings, in order to gain as much of the market belonging to the wooden shingle as possible, has made remarkable progress, chiefly on account of the persistency of those who are behind it. Handled upon the comparative merits of the different roofing materials this campaign would not be able to show the results it has shown, but the lack of knowledge on the part of the consumer has been capitalized heavily by the promoters of this campaign and their efforts have been all the more fruitful because shingle manufacturers and salesmen have not been presenting their side of the case in anything like the way they should.

A definite instance of this fact is afforded by one of the methods of comparison of which the patent roofing men are particularly fond. They will compare the cost of their roofings by the square with the cost of wood shingles by the thousand, which is entirely misleading, as 1,000 shingles will cover considerably more than the square, which means 100 square feet. For instance, taking the average width of shingles as 4 in., the various lengths of exposure will cover as follows:

4 in. exposure will cover 111 1/9 square feet.
4½ in. exposure will cover 125 square feet.
5 in. exposure will cover 139 7/12 square feet.

It is not probable that this point has been explained to many consumers who were in doubt as to which kind of roof they would use. It is very important that retailers should keep this point in mind and always see that the comparison is made on a proper basis. The best way in which to bring the matter home forcibly to the prospective customer is to let him know how many shingles will be required to cover 100 square feet, so that he may compare these figures with the figures for composition roofing. A little calculation from the figures given above shows that the number of shingles required to cover 100 square feet for the various lengths of exposure is as follows:

4 in. exposure—900 shingles required.
4½ in. exposure—800 shingles required.
5 in. exposure—720 shingles required.

The nails required for laying these shingles will be:

4 lbs. 3 d coarse galvanized wire nails.
5 lbs. 3 d iron cut nails.
5 lbs. 3 d cut zinc nails.

The roof sheathing required will be as follows, according to specification:—

1 x 4 spaced 2 in. apart 66 2/3 ft. to cover 100 square feet.
1 x 6 spaced 2 in. apart 75 ft. to cover 100 square feet.
1 x 8 spaced 2 in. apart 80 ft. to cover 100 square feet.

With the above information an example may be worked out showing the comparative costs of shingles and composition roofing to cover 100 square feet. Based upon a 4½ in. exposure for the shingle roof, the comparison is as follows:—

	Clears 5/2 at $6.00 per M.	Standard 5/2 at $4.00 per M.	Sound butts at $3.00 per M.
800 shingles	4.80	3.20	2.40
75 ft. 1x6 No. 2 roof sheathing 2 in. apart at $30	2.25	2.25	2.25
4 lbs. 3 d wire shingle nails at 5c.	.20	.20	.20
Total	$7.25	$5.65	$4.85

Composition Shingles

	Average quality	Better quality
1 square composition shingles	$6.00	$8.00
100 ft. 1 x 6 or 8 No. 2 sheathing laid solid at $30	3.00	3.00
4 lbs. nails at 5c.	.20	.20
Total per square for materials	$9.20	$11.20

Composition Roofing

1 square, including nails and cement, at $3.00	$3.00
116 sq. ft. 1 x 6 T & G or S & L No. 1 grade at $35.00	4.06
Total per square for materials	$7.06

The figures shown above were prepared by Mr. H. R. Isherwood, manager of the Retail Department of the National Lumber Manufacturers' Association and are based upon extra Star A, Star white cedar, or average quality of composition shingles, costing the dealer $4.50 delivered and 25 per cent. profit on selling price for dealer's profit. Other dealers who want to apply the comparison to their own cases can easily do so by using their selling price instead of the one mentioned.

No allowance has been made for waste in wood or composition shingles, as experience shows that the waste is practically the same in all cases.

Summing up the arguments for wood shingles, Mr. Isherwood states them as follows:—

Their history shows their durability. They are past the experimental stage, while composition shingles have been in use only a short time and still are experimental.

Statistics prove that the lasting qualities of wood shingles are greater than those of any other known roofing material when applied to a roof of proper pitch with proper nails.

The application of wooden shingles is not affected by cold, while composition roofing or shingles cannot be applied satisfactorily in cold weather. Wooden shingles are easy and clean to apply. They are adapted to shingle stains of any color. The stains can be applied at any time. The shingles hold their colors. The color effects can be renewed at any time and the colors applied to wood are most attractive.

Wood shingles do not attract heat or cold. The building with a wood shingle roof is cooler in summer and warmer in winter than other roofs.

A roof with a wooden shingle looks better than any other and it lasts longest.

Gets Out Among His Customers

A retailer who wants to get all the business possible nowadays has to go after it in every possible manner. It will not come to him naturally like it used to years ago. Initiative and energy on the part of yard managers count for a great deal under modern trade conditions; in fact, they make all the difference between success and failure. Just what to do in the way of working up retail yard trade is a problem which is difficult for some men to solve, but which other men are able to handle as a matter of natural ability. The way in which a successful manager tackles his own particular problems in a yard located in Iowa is told in a letter written by him to the Missippi Valley Lumberman. This manager tells of his work as follows:—

We are making special effort to sell silos, granaries, and in fact everything that can be built of wood and cement.

We have made it a practice to go out among our customers to talk new buildings and repairs and have found that this leads us to many talks that have helped us with our customers in many ways.

It has also been a great help to quote prices whenever we could on completed buildings and finished jobs. One thing that every lumber-

It's Not Hopeless

Grant that conditions in any given centre or in any stated community are demoralized; that lumber is being sold at cost, in many instances below cost; that there are among the dealers in that centre or that community, at least one of each of the types mentioned; that the situation as it exists appears hopeless; that your competitors have been perfectly willing to let one or two of you who are broader minded than the rest, carry the entire burden of attempting to work order out of chaos, year after year, while sitting idly by or even contributing by their actions to the process of tearing down what you have built up in the way of co-operative spirit; acting the part of both a sponge and a clam at the one time, i.e., soaking up everything that comes their way but giving nothing out in turn, until you have become disgusted and are about ready to quit. Your situation is not hopeless. On the contrary it can be remedied as easily as have been other ones throughout the country. But before it can be remedied you must know among yourselves what it costs to handle a thousand feet of lumber; a thousand lath, a thousand shingles; a hundred dollars' worth of mill-work. Not a guess but an accurate knowledge of these costs. Figured, not as each of you are now figuring them in the conduct of your individual business (I take it for granted that you are all figuring them) but figured along the most approved lines.—I. B. Hanks.

man should do is to get away from quoting lumber by the thousand feet.

We have found it a very good plan to keep an up-to-date set, or sets of plan books, and to invite the public to use them to get away from the difficulties in building where the parties are not familiar with the work. We have heard quite a lot of the high price talk but can always meet it by showing the farmer how much more material he can buy now with a bushel of grain or potatoes or even with "Mr. Porker," than he could before the prices had advanced.

Collection is where a good many of us have the weak heart, but collections must be pushed and the harder they are gone after, I believe, the better. Always try to get a definite date of settlement. Then the party expects to hear from you at this time and generally is ready to meet the statement. It also helps in making your customers become cash customers, and how we all like to see the cash customer come in. I have seen dealers who must have had a grudge against cash sales or wanted to cut their own throat. Some will advertise that they make a discount for cash and then will forget to give it to the customer when he comes in and pays cash for a small bill unless they are reminded of it. They will then come across with the discount and the excuse that they forgot it, as it was such a small amount. I believe that the discount on cash sales is one of the great helps to stimulate cash sales and that a party who will hang up a discount for cash sign and not be willing to stick to it shows his customers how small a soul he has.

Such a practice will kill cash sales as quickly as anything for you. Your cash customer will say, "well, if that is the way I get my discount I'll just have him charge it next time."

I believe in cash discounts and in living up to them, for really I believe that it is the best way to get a cash customer and about the only way to keep him with you.

Advertising we'll all agree is of the greatest importance to any business. Always keep the public familiar with the business you are representing and they will associate your name with their wants. Keep them posted on what you can do for them. Be ready to help any one with a difficult problem in regard to your line of business, and for goodness sake don't put him off. Treat him as you would like to have someone treat you if you were in his place. We have had good success with out up-to-date plan books and specifications in helping our customers and in giving them the idea that they really wanted. Advertising by circular letter is one of the best ways that I know of. To make your letters as personal as you can, try and make the customer who is to get your letter believe that you are right there with him and are having a personal heart to heart talk—it pays.

Another point—a letter that may not appeal to some business men, as it will take some time and in a good many instances some digging to find out what they want, is when you hear of a party who is looking for information on no matter what subject. If it is possible for you to get hold of anything interesting on it, put it in a personal letter to him and just wait the results, no matter if it is fishing, hunting or if it is some trip that he may be talking of taking and wondering what the expenses will be, what he will find after he gets there; and if it is good and your man has a good time, you know the rest.

Farmers will Have Money

Looking at things as they are now and what they promise to be, it seems to be a foregone conclusion that the farmers are going to receive more money for their products this year than ever before in the history of this country, says C. H. Ketridge, in the Mississippi Valley Lumberman. The very high prices of last year for grain did not prevail until the bulk of the small grain had passed out of the farmers' hands and only a compartive few who were able to hold in storage received the top-notch prices. But this year it will be different, for the government will insure the farmers getting at least $1.50 a bushel for wheat and corresponding prices for other grain. This, with the extraordinary big prices for stock, will put a tremendous amount of money at the disposal of the farmers and you can safely rely on it, too, that like everybody else, they are going to spend it for one thing or another. And it will be the lumbermen's own fault if they don't get a good share in the spending.

When people come in possession of more money than they have been used to having, it burns in the pockets of the great majority of them till they spend it for something they have wanted and had to go without for lack of means to buy it. It may be in the nature of luxuries or the necessities as the case may be. Usually, however, a good deal is spent for what is not necessary. There is many a farmer's wife who years ago made up her mind she was going to have a hardwood floor just like the one she saw in her sister's house when visiting in the city. She has got tired of scrubbing the old worn pine floor, and now that John is going to have a lot of money for his crops she is going to have a nice shiny oak floor and a Turkish rug to cover it. If it is not this, it perhaps is a built-in china closet or a swell looking mantel. Anyway, she is going to have something done in fixing up the interior of the house now they can afford it. Now, with that sort of feeling out among the farmers' wives, you lumber dealers are not onto your job unless you recognize it and make a campaign for cultivating this feeling that, as sure as you live, exists in the mind of every farmer's wife who has not got these or the other things wanted for the improvement of the home and which you have got for sale or can get for her.

Put together some of your old time oak flooring in a sample of about 12 x 14 inches in size. Have it finished and polished till it shines. Take it out some day and call at some of the farm houses. Show it to the women folks and tell them just what it will cost for covering the old floor in the best room. Even though you may not make a sale you will set them to thinking about it, and that means the creating of a desire to have it. The chances are also there will be a discussion over it with "John," and the probability is the woman will have her way in the matter, as all women do when they set their heads on getting a certain thing they want.

You know how it is yourself, when you get a raise in salary or have had a good year's trade, your wife will suggest something she would like to have for the house that she had wanted though they couldn't afford before, but with a larger income, she wants them, and you know what that means. Give a good deal of your attention and selling talk to the farm women folks this year.

Decreased Pulpwood and Woodpulp Shipments by T. & N.O.

Pulpwood shipments were made over the Temiskaming and Northern Ontario Railway, during June, 1917, to Merritton, Thorold, Toronto, Georgetown, Ottawa, Ont.; Niagara Falls, Watertown Carthage, Norfolk, N.Y.; Johnsonburg, Pa.; Port Huron, Grand Rapids, Mich., and Appleton, Wis., as follows:—

June 1st to 7th	1,385 cords
June 8th to 14th	1,972 cords
June 15th to 21st	1,958 cords
June 22nd to 30th	3,382 cords
	8,697 cords

This is a decrease of 3,973 cords from preceding month or 31.4%.

Woodpulp and paper shipments were as follows:—

	Woodpulp	Paper
June 1st to 7th	147 tons	1,085 tons
June 8th to 14th	406 tons	1,198 tons
June 15th to 21st	204 tons	1,547 tons
June 22nd to 30th	428 tons	2,132 tons
	1,185 tons	5,962 tons

This represents a decrease on woodpulp shipments of 752 tons or 39%, and an increase in paper shipments of 371 tons or 6.6%.

Shortage of Railway Wagon Timber

Some of the most important railway wagon building concerns in the United Kingdom are located in the midland counties, and all are finding it impossible to execute the numerous orders on hand. In conversation with one firm, it was ascertained that there is a serious shortage of the heavy timbers used in wagon construction, and there appears to be no prospect of easing the situation. Many cargoes of timber have been sunk, and the difficulty with which shipping companies are contending, naturally react upon manufacturing industries dependent upon incoming cargoes for supplies. As far as is practicable, British timber is being utilized, but so much of it is "wet" that industries in which "dry" timber is indispensable are very much hampered.

John P. Mosher Visiting Maritime Mills

Mr. John P. Mosher, of South Maitland, Nova Scotia, buyer in the Canadian market for L. N. Godfrey Company, of Boston and New York, U.S.A., will make a trip among the mills in Nova Scotia and New Brunswick during the next few days in the interests of his American clients. Mr. Mosher is a native of South Maitland and is very well known in Canada, where he has been travelling for years in the interests of his lumber trade. Mr. Mosher is now located for a few days in Halifax, supervising the loading of vessels in the interests of L. N. Godfrey Company, who are large buyers of Canadian spruce, hemlock, lath and shingles.

Mr. R. D. Hyde, secretary of the Shingle Agency of British Columbia, has resigned, in order to accept a position as sales manager of the Huntting-Merritt Lumber Company, Limited, Vancouver, B.C. His resignation takes effect on August 1st.

Methods of Piling Lumber for Drying

How to Construct Piles so as to Prevent Injury to Stocks from Moisture, Dirt, Warping, Stain, etc.—Endwise and Sidewise Stacks

"The Seasoning of Wood" is the title of a bulletin (No. 552) which has been issued by the United States Forest Service. The bulletin was prepared by H. S. Betts, and contains much that is interesting to lumbermen. In the section dealing with air seasoning, it says:—

Sawed lumber generally is dried by being piled in stacks with air spaces between the boards. In forming the stacks the boards usually are laid flat, with strips called stickers between courses or layers. A space also is left between each board in a layer and the adjacent board to provide for the circulation of air throughout the stack. Flat or horizontal piling may be of two kinds: (a) With the ends of the boards toward the alley-sidewise piling. The accompanying diagrams illustrate the two methods. The stocks are arranged to slope from front to rear, and to lean forward so that water dripping from the top falls to the ground without trickling down over the courses below. With either method of piling the stacks should be so located in the yard that the prevailing winds blow through them rather than against the ends.

Most lumber manufacturers and dealers use the endwise method of piling. A number, however, have adopted the sidewise method, which has certain advantages in the matter of air circulation. In endwise piling the stickers obstruct the passage of air from back to front of a course, while in sidewise piling the passages from front to rear are clear. Water which forces its way into the pile is more efficiently drained in sidewise piling, and the likelihood of sticker rot and discoloration due to the accumulation of moisture, dust, and dirt against the stickers is lessened.

The bottom boards in a stack rest on sticks, which in turn rest on foundations, preferably of stone, cement, or metal. Pieces containing rot should never be used for foundation timbers or skids, or allowed to remain in the pile. The vicinity of the pile should be kept clear of weeds.

The use of cement and metal foundations is especially feasible in retail lumber yards and in those maintained by wood-using factories. In retail yards, where economy in space often is the essential thing, the piles are high and a particular space usually is allotted to each class of species of lumber. In factory yards lumber often is held for a number of years before being used. In such cases the frequent renewal of wooden foundations under lumber piles entails considerable expenditure of time and money, to say nothing of the danger of infecting lumber by bringing it in contact with partly rotted foundation timbers. For these reasons foundations of a more permanent character are constantly growing in favor in retail and factory yards.

Sawmill yards, on the other hand, often contain several million feet of material and cover several acres. Lumber coming from the saw generally is piled wherever most convenient, provided it is placed at the distance from the mill required by insurance companies. Economy in storage space generally is not essential, and piles of the same species and kind of lumber are likely to be found in a number of different sections of the yard. In addition, the stock is constantly being turned over, thus giving an opportunity to renew the foundation timbers at comparatively small expense. A number of large lumber companies, however, have adopted cement as a foundation material.

Lumber-storage yards need to be reasonably well drained, or at least the contour of the ground should be such that water will not stand under the stacks after a storm. Otherwise decay is apt to get a start and spread throughout the pile. Where the ground offers but poor natural drainage facilities, some artificial system of drainage usually is employed. One of the illustrations shows the system used in the yards of two large lumber companies in the southern hardwood region. This arrangement not only prevents the collection of rain water under the lumber piles, but also gives the required slope to the stack, which on level ground has to be secured by building up the foundations.

A top dressing of cinders has been found satisfactory in some storage yards.

Rules for Piling Lumber

The following set of rules for piling lumber covers the more important points to be observed in the construction of foundations, shape of stack, arrangement of stickers, etc.:

1. Foundations (Endwise or Sidewise Piling)

(a) The foundations should be strong, solid, and durable.

(b) The top of each foundation should be level, and from front to back the top surface of the parallel skids should be in alignment, so that the lumber to be piled will bear equally upon each one.

Method of providing drainage under lumber piles.

(c) The front foundation should be raised above the second, and the second above the third, to allow a slant in the stack of 1 inch to every foot.

(d) The foundations should be spaced not over 4 feet apart, except for heavy planks and timbers.

(e) The front foundation should be of sufficient height to provide space for free circulation of air under all parts of the pile.

2. Lumber (Endwise Piling)

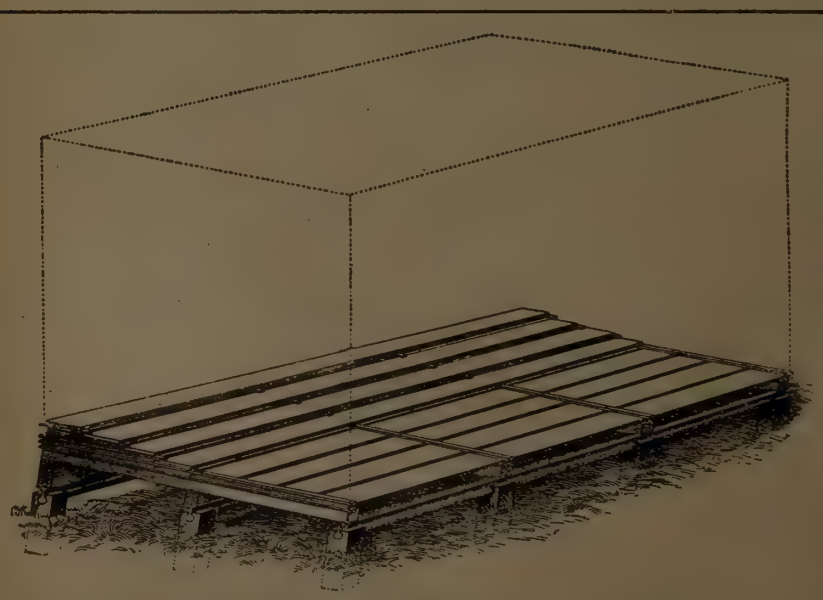
(a) Skids, preferably 2 by 4 inches, should be laid on top of the foundations.

(b) Boards of equal length should be piled together.

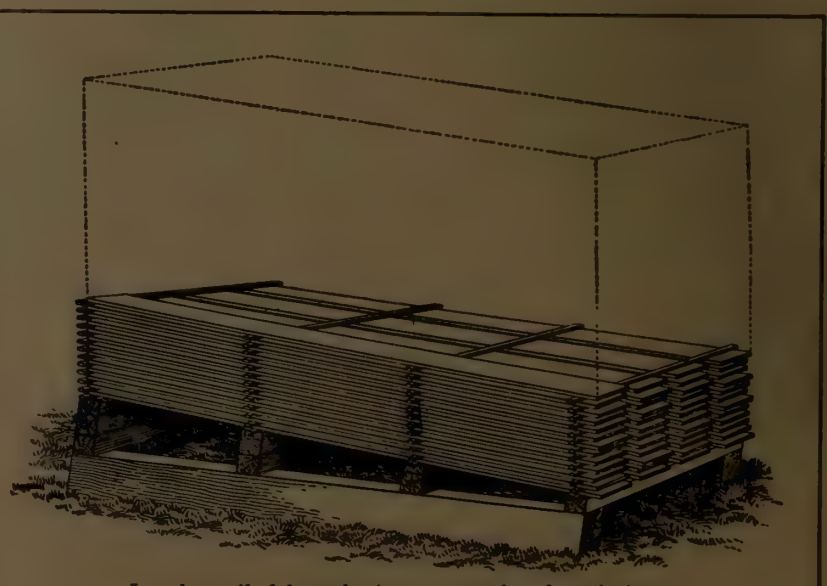
(c) The ends of the boards should rest upon the front and rear skids.

(d) A space of approximately three-fourths inch should be left between boards in the same layer.

(e) Lumber piled in the open should have the front ends of boards



Lumber piled sidewise on cement and metal foundations.



Lumber piled lengthwise on wooden foundation.

in each layer slightly protruding beyond the end of the layer beneath, to give a forward pitch to the stack.

3. Lumber (Sidewise Piling)

(a) Skids, preferably 4 by 6 inches, should be placed across the foundations at about 4-foot intervals. The number of skids depends upon the thickness of the lumber.

(b) Boards of equal length should be piled together.

(c) The boards should be placed on the skids, with about three-fourths inch between boards in the same layer.

(d) Lumber piled in the open should have the front board in each layer project slightly beyond the board in the layer beneath, to provide a forward pitch to the stack.

4. Stickers (Endwise or Sidewise Piling)

(a) Stickers should be of uniform thickness, preferably seven-eighths inch for 1-inch lumber and 1½ inches for 2-inch lumber. Their length should be a few inches in excess of the width of the pile.

(b) Stickers should be placed upon the layer of boards immediately over the skids and kept in alignment parallel to the front of the piles.

(c) The front and rear stickers should be flush with, or protrude beyond, the ends of the boards.

5. Roof Protection (Endwise or Sidewise Piling)

Cover boards, as a roof protection, should be laid on the top of the pile, extending a few inches beyond the front and rear ends of the stick.

6. Spacing Stacks (Endwise or Sidewise Piling)

Space between the piles should not be less than 2 feet, 4 or 5 feet is preferred if yardage conditions permit.

7. Dimension of Stack (Endwise or Sidewise Piling)

The customary width of stacks is from 8 to 16 feet. The height is governed by the size and character of the lumber and by the methods of moving it.

8. Treated Ends (Endwise or Sidewise Piling)

The ends of lumber 2½ inches thick or over, unless of the lower grades, should receive a brush treatment of paint or some liquid filler.

The rules just given are based on information obtained through field investigations and from lumber manufacturers and wholesale and retail dealers, and accord with the best lumber-piling practice in general commercial use. Certain species of wood, however, require particular care in air-drying, and in this case slight variations from the rules are necessary in order to secure the best results.

The Principles of the Trailer and the Advantages to Be Gained by Its Use

By C. H. Martin

The automobile and motor truck as developed to-day have a drawing power on hard roads that far exceeds their carrying capacity. Unless this drawing power is used while it is being made, it is wasted because it cannot be saved up and used at some future time. It must be used while it is being made. The trailer, which is in effect an ordinary wagon or cart built to stand the speed at which it is taken by the motor vehicle, is the medium through which this power may be utilized.

For the purpose it was intended, the ordinary wagon design cannot be improved upon, and as the purpose of the trailer is the same as that of the ordinary wagon—merely a carrying vehicle—it is only necessary to design the parts to withstand the strain of high speed to have a perfect trailer.

A year ago fully half of the motor truck manufacturers were very much opposed to having their respective trucks used for pulling trailers behind them. In fact, some engineers pretty well up in the profession opposed the use of trailers. But to-day I do not know of one single manufacturer or engineer who has not come out openly favoring their use.

As far as damage being done to the automobile or the motor truck when used to pull a load behind it, when one stops and thinks just a minute he must see that less damage can result by drawing several times the carrying capacity than carrying just a little more than the maximum capacity. The reason is this: That the driving mechanism of the automobile or motor truck must be built to overcome a certain resistance. This resistance is where the tire comes in contact with the road. The factors combining to make this resistance are weight and coefficient of friction.

In any properly designed motor vehicle carrying its maximum load, when a clutch is dropped suddenly into a flywheel the inertia of the flywheel will slip the driving wheels on a dry road. If it will not do this, and some part of the driving mechanicm gives away instead, that particular motor vehicle is weak structurally. When, however, more than the maximum load is carried, the breaking point is likely to come somewhere else and a gear may strip, a key sheer off, a shaft twist, or a universal joint give way. If no greater load is put on the driving wheels than the designer intended, no serious damage can result to the driving mechanism regardless of how much load is hauled back of these wheels. The wheels will simply slip until the flywheel inertia is exhausted and the motor stalls. Thus, it can be seen that instead of the motor vehicle being damaged by the use of a tractor, the driving mechanism is frequently saved, because there is not the tendency to put an overload on the driving wheels.

There are three methods of using this trailer principle that are more or less popular, and there is quite a controversy as to which is the best. They are the four-wheel type, which is drawn by a pole hitched to some part of the motor vehicle; the two-wheel type, which has a body balanced over the axle, and which is also hitched to some part of the motor vehicle; the semi-trailer, which is, as the name implies, only half a trailer and the other half is carried. All have their place.

In a perfectly level country, where little weight is required on the driving wheels for traction and where there is no congested traffic and no occasion for backing, a four-wheel trailer is as good as any other; or, under these conditions the two-wheel cart, where the load is balanced over the axle, may be used. But for city streets the semi-trailer is, in my opinion, more to be desired, the reason for this being that the over-all length is only a foot or so more than that of the convenient truck of the same loading space; it can be handled entirely by one man, can be turned in narrow quarters and backed in the same manner that a wagon is backed by a horse. Further, there is sufficient weight on the driving wheels for traction. The semi-trailer is fast becoming popular in the cities on account of the ease with which it can be manipulated. It is very much simpler and therefore lower in first cost, than the four-wheel trailer, and it utilizes the full tractive force of the motor vehicle. Probably the adoption of the semi-trailer to the exclusion of the four-wheel trailer in cities is being hastened by the fact that a number of cities are legislating against the use of four-wheel trailers because of the difficulty of manipulating them in congested traffic.

The advantage to be gained by the use of a trailer is in the main one of economy. With the conventional type of motor truck, as the capacity increases, the price mounts very rapidly; in fact, a two-ton truck costs almost twice as much as a one-ton truck. On the other hand, if a concern has a two-ton load to carry, a three-quarter ton capacity truck used with a two-ton trailer makes a two-ton motor vehicle at about half the cost of a two-ton conventional truck. This three-quarter ton truck and semi-trailer will do as much work as the two-ton truck and the upkeep cost is in the same proportion as the first cost. A pleasure car runabout may be used as a tractor and can safely draw a ton. It can thus do duty as a commercial vehicle as well as a pleasure vehicle. This is surely an advantage worth considering.

An advantage to be gained by concerns having long material to draw, is that the semi-trailer may be made almost any length desired; and owing to the fact that the tractor can turn completely under it, it can be handled and turned in streets no wider than the body is long. Lumber merchants, plumbers, painters and many others are greatly benefited.

A great advantage is that idle time of the motor vehicle can be entirely eliminated. One motor vehicle can serve a number of trailers —one trailer loading, another unloading and a third on the way. Another advantage gained by using the tractor principle is that one motor vehicle as a tractor may be used to draw many different kinds of wagons—end dump, bottom dump,long lumber wagons, drays, furniture vans or any other type of wagon the general trucking concern must use in its business. The conventional truck, on the other hand, has usually one body only.—The Lumber Co-operator.

Mr. Booth Heavily Assessed

Mr. John R. Booth, of Ottawa, will be called upon to "foot the bill" pretty heavily in connection with the new income tax proposals which have been introduced into the House of Commons by the Minister of Finance, Sir Thomas White. Unlike the other paper-making magnates of Canada, he is in a peculiar situation. He is running the business of lumber and paper manufacturing individually. He is the sole owner of the large mills at Ottawa, and has large interests in railroads, banks, and other corporations. On all incomes up to $6,000 per annum it is proposed to place a tax of 4 per cent. Above that amount there is to be a graduated super-tax imposed, which goes up to 25 per cent. on incomes over $100,000. Thus Mr. Booth, whose income is well over the last amount, will be assessed for a good many thousands.

The sawmill at Salt Spring Island, destroyed by fire last year, has not yet been rebuilt. It was owned by the Bullman Lumber Company, Limited, Victoria.

Can We Help You?

Grading of White Cedar Shingles

Editor Canada Lumberman:—Will you please send me a copy of the rules and specifications used in grading white cedar shingles according to the standard most generally followed:—J. S. Cassidy—Riviere Trois Pistoles, P.Q.

The rules drawn up by the White Cedar Shingle Association, in cluding members in the Maritime Provinces and Quebec, for the grading of 16 in. cedar shingles are as follows:—

Extras:—A perfect shingle, not less than three inches in width, free from rot, stains, knots, shakes, sap or other defects.

Clears:—To be not less than three inches in width, and no knots six inches from butt. Above that will admit of knots, but no hole larger than a twenty-five cent piece ten inches from butt. Free from sap and wane.

Second Clears:—To be not less than three inches in width, free from sap and wane. Will admit of sound knots, but nothing coarse or black to be closer than five inches from the butt. No holes or loose knots larger than a twenty-five cent piece, or rotten streaks closer than nine inches from the butt.

Clear Wall:—To be not less than two and one-half inches in width, six inches clear, and free from wane for twelve inches. Sap no defect.

Ex. No. 1:—These may include all narrow shingles from above grades but nothing less than two inches in width. Moderately sound knotted for four and a half inches from butt, but small black knots no objection.

No. 1:—All refuse shingles to show sound butts.

Bunching:—Shingles must be bunched tight on branded end, and no openings larger than one-half inch on back end. Joints to be well broken, and to be kept close to standards and ends of gauge.

Seaplane Cedar Wanted

Editor Canada Lumberman:—Do you know of any manufacturers who make white cedar suitable for seaplanes?—United States Wholesaler.

After sending out a number of enquiries in regard to this matter to large manufacturers in Quebec the Canada Lumberman is advised that it is exceptionally difficult to obtain this class of wood. The largest manufacturer who replied, stated that his firm took out a contract a few seasons ago for cedar canoe stock, 2 in. and under in width and ¼ in., ½ in., ⅝ in., ¾ in. thick and 30 ins. and up in length. As a result of their experience at that time they say:—"We will never take another contract of this kind again. We got about 70,000 feet surface measure during the whole season. As we were cutting square cedar all that season we had the best chance we ever will have. We now refuse to sell anything but 2 in. or 3 in. thick stock, the purchaser taking all that comes from the log." The same firm suggests that Port Orford cedar would be the best quality of cedar for this work. The Canada Lumberman would like to hear from any of its readers who can give further information on this subject.

White Pine Grading Rules

Editor Canada Lumberman:—I notice in current lumber prices published in your journal that white pine is graded into uppers, selects, fine common, No. 1 cuts, No. 2 cuts, and that barn boards are graded into No. 1, 2, and 3. Will you kindly explain fully the grading of pine and the quality of each grade?—Reader.

There is no official set of grading rules in use in Canada, relating to white pine. In 1912 an effort was made to have a set of rules adopted by the Canadian Lumbermen's Association, but although the rules submitted were generally commended, no action was taken. The rules submitted at that time, however, are as close to the actual practice in white pine grading as it seems possible to come, and a good many members of the trade are using them in their business. Under these rules the grades mentioned in the above question are described as follows:—

Uppers shall be 10 ins. and over wide and free from all defects, and stand a little bright sap-wood, in the absence of bright sap a small pencil knot is permissable.

Selects shall be 8 ins. and up wide. When 8 ins. wide it may carry the same defects as a 10 in. Upper, and these defects increase according to width of piece.

Fine Common shall be 8 ins. and up wide. A piece 8 ins. may have bright sap across back or slight sap stain, may also carry a few pin knots, providing they do not go through the piece.

No. 1 Shop shall be 6 ins. and up wide, and 10-16 ft. long, and shall cut not less than 66-2/3 per cent. into No. 1 door stock, giving sufficient stiles to care for the rails and muntins in a standard 4-panel door. Fifty per cent. of the remainder shall produce No. 1 sash cuttings.

No. 1 Barn shall be 4 ins. and up wide, will admit of sound round red knots of about 1¼ in. in diameter, and must have good edges, no shake, bright sap.

No. 2 Barn shall be 4 ins. and up wide, will admit of sound red knots, 1¼ in. in diameter, an occasional tight branch knot, must have one good edge, will admit of some shake and stain.

No. 3 Barn shall be 4 ins. and up wide, will admit of sound red knots 1¼ in. in diameter, and smaller black knots, also branch knots, either red or black, if they are tight, considerable fine shake. Ten per cent. of the pieces may show stain on worst face.

New Methods in Retailing

Today there are so many different ways of advertising that it becomes a long and tedious job to describe them. However, the most important is a clean, attractive, handy place of business, an error-proof system of accounting, the milk of human kindness and a living, breathing, palpitating desire in your heart to give service. These are the best paying advertisements any man can have, says a contributor to the Mississippi Valley Lumberman.

Your office should be warm, neat and pleasant. A little paint goes a long way toward making the yard presentable. The sheds and fence should be kept well painted, the alleys raked clean, the stock free from dust and well piled.

It isn't always possible to have a fine office and shed, but it is always possible to have the poorest of equipment neat, clean and cheery.

Nearly every small town has at least one family poor as Job's turkey, whose children's clothes are threadbare, patched and worn, but whose faces and clothing are clean and neat. You wonder how the mother can keep her children so tidy. You compare them with the best dressed children in your town and they do not suffer by comparison.

Your yard can be kept as sweet, neat and attractive, no matter how poor a layout you may have, if you have the imagination to plan the proper improvements and the gumption to square things away. A neat yard and a tidy appearance will make your goods appear fifty per cent. better to the trade.

Train yourself to be accurate in your accounting and do not allow either yourself or others to do slipshod, hurried work on the books. Give your customer an invoice with every purchase and either a binder or heavy envelope to keep it in. Do not allow your book work to accumulate. The saying "Do it now" is particularly applicable to bookkeepers and accountants. In order to give the best of service to your customers your accounting system should be as nearly perfect as possible. Then if you are constantly on the lookout to avoid mistakes, ready to adjust differences and rectify errors, have a broad enough vision to put yourself in the other fellow's place, are big enough to overlook his pettiness and go the limit to please him and give him real service, you are bound to sell goods. If you go out with a good publicity campaign and draw the people in to show them what a good fellow you are and how your wares excel, you are bound to sell more than the best fellow in the world, if he doesn't let the people know he is in business.

Don't Start Until You Are Ready

However never start a publicity campaign until you have everything in shape, not only to display your goods but to handle your business. The man who advertises before he is thoroughly ready to do business does not reap a dollar's worth of benefit from his advertising but rather loses heavily, for the customer who is attracted to your office or place of business by your advertising, and is disappointed, will never take your advertising seriously again. You may never get him back. He has you noted as a prevaricator and your advertiseing arguments do not affect him in any way, except the wrong way.

The small "two column, eight inch" card stating that your place is headquarters for lumber, lath, shingles, lime, cement and plaster, "Let us figure your bill," run twelve months in the year in the same spot in the local paper is just about as effective an aid to your sales department as a boy scout armed with an air rifle would be in an invasion of Germany.

Why not change the ad weekly, both in size and wording? Put a little thought into it, run a few attractive cuts and make it different.

If you haven't the time and ability to write the newspaper ads, hire an advertising agency to write them for you. It is an easy matter

to find an advertising bureau which will furnish retail yards with a new ad each week.

The newspaper reaches homes you may never be able to reach in any other way. You should be sure your portion of it is as catchy and interesting as possible. Take a few pictures of representative farm and city buildings for which you have furnished the materials. Have cuts made from them and run them in connection with your newspaper advertising. You can keep them to make up a catalog in the fall. These cuts are inexpensive and thus serve a double purpose.

Show What You Have Done

Did you ever consider putting out a book of your own, showing dwellings, barns and business buildings for which you have furnished the material? A booklet made up of familiar scenes will be a far better advertising scheme than a calendar. Such a book can be gotten up at very little expense if you use the cuts furnished you free of charge by the side line people and the cuts of local scenes as suggested above.

Whether you can get up a catalog of your own or not, you don't want to overlook the value of the free advertising offered by the people who sell you gates, wire wall board, paper, etc. Most of these concerns have a good and complete advertising campaign which they put on free of charge. This advertising is worth good money to you and requires little of your time. Simply see that it gets into circulation properly and it doesn't cost you a cent.

Circular letters expertly written and carefully gotten up are the best of advertising. Seal your letter and put a two cent stamp on it. Make them look and read as much like a personal letter as possible. Avoid "I" and "we" in your letters and put strong emphasis on "you." Get away from yourself and try to put yourself in the other fellow's shoes. Try to imagine what would interest and influence you if you were receiving the letter.

Make Every Sale an Advertiseement

Don't forget to tag every big load of lumber that leaves your yard. It may pass a dozen people who are planning to build, and bring your name conspicuously before them. Tags are inexpensive and effective. Put up a sign on every job where your furnish materials. Let the world at large see that you are selling some of the material that is being used around town.

Unusual or "stunt" advertising gives full play to the imagination and is the seasoning of the whole dish. It calls attention to the steady, solid, consistent slugging of your other advertising and forces the attention of the public to you and your business. Whether it consists of an elaborate display at the fair or merely of a load of lumber properly tagged, following a circus parade, it calls decided attention to your business, while your regular advertising is more of a constant reminder. If you neglect the unusual or stunt advertising you cannot get the full benefit of your newspaper advertising, catalogs, circulars, street car cards, picture slides, etc. The stunts throw all of your other work into the lime light. When your newspaper ad catches the reader's eye, he thinks of the stunt you pulled off at the fair or on circus day, wonders what you are doing now, reads your copy and remarks that your outfit is a live wire. You need not wait for a fair or circus to come along. Opportunities for stunt advertising appear every day if you are on the lookout for them and not afraid of publicity, as some men seem to be. The day of the old conservative, super-dignified close-mouthed business man is past and to succeed you must court publicity.

The Band-Saw in Shipbuilding

The heaviest irregular band-sawing in the world, it is claimed, consists of sawing out heavy timbers for the ribs of wooden ships. Certainly it is no child's play to juggle, say, a 12 x 16 in., 8 or 10 ft. long, over the saw table, and saw it into a gracefully-twisted curve right to the line. This is what the ship band-sawer has to do. To facilitate his work as much as possible he has at his disposal something like a half-dozen husky helpers and a heavy tilting band-saw especially designed for ship work.

The massive table of the ship band-mill always remains level, but a frame carrying the band wheels can be tilted anywhere from 90 to 45 degrees while the machine is going at full speed, and even when the saw is in the cut; in the latter case, however, the tilting must be done carefully and comparatively slow. This is how the twisted cuts are made, i.e., by gradually tilting the saw as the timber is fed through. On some ship-saws the tilting is done by power, but in other cases the saw is tilted by means of a hand-wheel. One helper is assigned to this work, and his station is on the extended table back of the saw.

Every timber, besides being scribed for outline, is marked according to the shipbuilder's numbering code, which designates the angle at which it must be sawed. The man at the tilting-wheel observes these numbers and sets his saw to coincide with similar numbers on the machine. When the numbers on a single timber vary it means the angle changes just that much in the length of the piece, resulting in the twisted effect above mentioned.

While the timber is being sawed the free ends are supported by roller-top trestles, on a level with the machine table. The feeding is helped along very materially by the crank man, who slowly turns an iron friction roller set in the table just in front of the saw blade.

The band-saws for ship work vary from 1 to 1½ in. in width. A thin blade, however, is out of the question, because it is not stiff enough; it is for ever leading in or out. It produces a snaky cut and gives trouble generally; cracks soon develop, and a broken saw is invariably the result. An 18-gauge saw, with strong teeth, set for plenty of clearance, gives the best results in ship work.

There is some question as to whether rubber-tired wheels are best for this type of saw. The new machines are, I believe, all fitted up that way, but many operators prefer to run their saws directly on steel-faced wheels, the same as in log sawing and re-sawing. They can then fit a metal scraper to the wheels to keep them clean and free from dust. A rubber-tired wheel always picks up a lot of dust and pitch, which sticks so tight that it can hardly be removed.

When the saws are run directly on steel or iron-tired wheels the sharp points of the teeth must, of course, project somewhat over the rim. For this reason it is important to select a machine fitted with adjustable wheels, or at least one wheel that can be shifted on its shaft, so the wheels can be lined up to make the saw track perfectly.

Just now there is a very decided boom in the shipbuilding industry all along our coast line. New yards are springing up at every port, and every yard is fairly teeming with activity. In spite of the great gangs of expert workmen going at top speed and under the direction of master shipbuilders, it takes many months to complete even a fair-sized wooden vessel.

Only the best of workmanship and material go, as a seagoing ship can be built none too strong to resist the elements. The timbers must be sound, clear, and of the strongest structural wood obtainable.—"Traveler," in the Woodworker.

Chaudiere River Flood Causes Heavy Losses

Immense loss was caused to lumber companies by the flood which swept through the Chaudiere Valley as the result of a heavy storm on July 30. The loss is estimated at over two million dollars, but this is more or less of a guess. Booms at the mills of the Brown Corporation, John Breakey, H. Atkinson, and B. C. Howard broke, owing to the unprecedented rise in the height of the river. This caused a large amonut of lumber and pulpwood to be carried down the river into the St. Lawrence. The lumber, according to one correspondent, covered the St. Lawrence from shore to shore for over a mile between Quebec and Levis. A lot of this was thrown upon the shore. The River Chaudiere was also packed with the floating wood, and much of it was piled in some of the villages as it was caught on its way downstream. A report from Sherbrooke puts the loss of John Breakey at $1,500,000 and of the Brown Corporation at $750,000.

British Navy Needs Canadian Ash for Oars

An important British company which manufactures long oars used for the life boats of ocean liners and the Royal Navy, wishes to secure ash timber limits in Canada containing sufficient quantities of ash to justify the establishment of a plant for the manufacture of boat oars in Canada. Information may be obtained by addressing the Commercial Intelligence Branch, Department of Trade and Commerce, Ottawa. (Refer File 15782).

Corporal Huntley G. Gordon, son of Mr. Philip D. Gordon, of Mason, Gordon & Company, Montreal, has been slightly wounded. He enlisted about two years ago in one of the Highland battalions raised in Vancouver, and has been at the front for over a year. Prior to enlisting he was in the lumber business in British Columbia. He is 24 years of age.

A freight train consisting of nine cars loaded with pulp recently ran away from the yards at Jonquiere, P.Q., and traveled down the line to Chicoutimi at a rate of 45 miles an hour, winding up by crashing into a locomotive and van of the Quebec and Lake St. John Railway, from which the crew only escaped by jumping, a few seconds before the collision occurred. The damage to the cars and pulpwood was extensive.

When one of the big trees in California fell John Muir counted 4,000 rings from the heart out. That meant the tree was forty centuries old. Thus it was a strong young tree when Abraham went into Egypt; it was bearing seed when Sodom and Gomorrah were destroyed; it was old as America when Joseph was sold into Egypt, nearly a thousand years old when David slew Goliath, and older when Christ was born than the Christian religion is to-day!

Canada's Timber in England and France

Special Trade Commission Criticizes Canadian Producers for Lack of Initiative in the British Market—Apathy a Drag on French Trade

The Special Trade Commission sent by the Canadian Government to Great Britain, France and Italy have published an extensive report of their work, from which the accompanying report on forest products is reproduced. While much that the report contains is valuable to the trade and industry, it should be borne in mind that the transportation and marketing difficulties have been greatly increased since the report was prepared, and that, for the time being, exports of timber and lumber to Great Britain are possible only under special license.

THE average annual value of wood and timber imported by the United Kingdom is $1,250,000,000. The largest import from Canada is associated with sawn or split fir, pine, and spruce, which was valued at $13,000,000 in 1914-15 (fiscal year). The total British imports were valued at $63,500,000, so that Canada does not supply more than one-fifth. Her chief competitors are Russia, Sweden, the United States and Norway. In normal times imports from Russia exceed $35,000,000; from Sweden $15,000,000; from Norway $5,000,000 and from the United States $8,000,000.

From the time of the earliest settlers, Canada has exported timber. Many large and prosperous firms have carried on business with Great Britain for decades past. To-day the timber business with the United Kingdom is carried on by relatively few firms. Some of the largest shippers in Canada are closely connected with British firms. They understand the business thoroughly and carry it on most profitably. From an outsider's point of view it would appear that the bulk of the sawn lumber suitable for the English market is under the control of very few dealers. It would seem that the business has been largely left with them without serious efforts on the part of a large number of Canadian lumber manufacturers to compete.

The consequence has been that with a limited supply the price often went up on Canadian lumber, while other countries competing with Canada for the valuable British market, kept their prices reasonable and supplied sufficient quantities.

While the Commission, with its comparatively limited knowledge of a trade which has been steadily developing for many years, can hardly hope to point to any improved methods of carrying on the business, it would nevertheless conclude, on the evidence at its disposal, that if more of our Canadian dealers looked after the British trade, a much larger and more varied production at home and for exportation is bound to follow in coming years.

The situation in Great Britain is notably different from that found in France, in two important respects. First, Canadian forest products are well known; second, the difficulty of securing ocean transport is, in normal times comparatively slight. It is therefore easier to sell Canadian timber in Great Britain than in France.

A point of outstanding importance in connection with Canadian timber trade with Great Britain is that an evident lack of initiative on the part of our producers has denied to us the important place in the British market which is due to one of our great national industries. Few merchants are sufficiently interested to send their agents overseas to ascertain the needs and prices current in Great Britain. Many Canadian firms even do not reply, or reply carelessly, to enquiries from abroad. In fact the British merchants have found it necessary to open up agencies in Canada. They naturally attend to the needs of their own business, and it is unreasonable to expect that they should go beyond this for the sole purpose of expanding Canada's lumber trade.

Another very serious obstacle is the cost of preseent ocean transportation, although it must be admitted that prior to the war when occasionally rates were reasonable, we rarely tried, and more rarely still were prepared to take advantage of such opportunities in Great Britain.

Bristol, Liverpool, Manchester and the Western coast of the British Isles can absorb our entire present production without taking into account the needs of London, Hull and the eastern coast.

The investigations of the Commission do not lead to the conclusion that pit props, railway sleepers, poles and pickets are in themselves paying items of our lumber trade. It seems, however, that they would largely help the expansion of our present sales in Great Britain. They are necessary commodities, and if customers in Great Britain must seek them elsewhere, they will also fill the rest of their orders elsewhere. Tariffs may have largely prevented us from selling doors, windows, mouldings and floorings in the French market, but the reason does not hold good for the English trade. How can Canada hope to build up an extensive export trade in these commodities, when in 1914, for instance, for the needs of our own market, our imports of wooden doors alone, from the United States totalled $476,000? In 1915, the smallest year of the building trade for a long period imports reached $235,000. The doors which we import in such large quantities are exactly those which are required in England.

While this condition has lasted about four years, it is only temporary, and may very well correct itself in the near future, as prices of United States wood products have already advanced and will probably continue to do so. Of course, our own manufacturers cannot expect to recapture even the domestic market, unless they are fully equipped, not only in the manufacturing end. but also in selling organization. They should seize the opportunity which the war has created for an extension of trade.

This practically unlimited demand which will exist in France after the war, cannot possibly be satisfied by the United States. Canada should have a large share of it. If so, why not, at the same time, make a determined effort to conquer the British market? It must, however, be borne in mind that cheap production alone is not sufficient, and that large and effective selling organization, generously stimulated by advertising, is also necessary.

In the past, Norway and Sweden have competed with the United States and not without success. This is indicative of possibilities. At all events prices offered are fairly attractive.

Small Woodenware

Broom handles.—In 1912 an average of 3,400 gross were imported per month. About 1,200 gross came from Scandinavia, 700 fross from Finland, 1,100 gross from United States and 400 gross from Canada. Canadian and American handles are preferred to others, inasmuch as the wood used is more suitable. The importers will pay slightly higher prices for Canadian handles. The average price in 1914 was 12s. per gross—£1,980 per month, or $118,800 per year.

Sizes, 50 in. x 1½ in. x 1 in.

Quality, 1st, 2nd, and 3rd.

Packing, ½ gross or 1 gross bundles, preferred in canvas wrapping.

Dowels.—In 1913 about 68,000,000 pieces entered Great Britain, 13,000,000 from Austria, 14,000,000 from Scandinavia, 32,000,000 from the United States, 9,000,000 from Canada. The Austrians had been gradually increasing their exportation, up to the outbreak of the war, but on account of their not having any other timber available but beech, which is not suitable for all classes of dowels, their sales were limited. Scandinavian timber is most unsuitable and their goods have always been sold as second quality. They were cheaper than the United States or Canadian product, but the woods were not sold in large quantities. United States manufacturers specialize in the dowel business, but Canadian manufacturers could probably compete to advantage if they were organized for export business. When Canadian dowels are imported they give every satisfaction. The average value of dowels imported to Great Britain in 1913 was £1 per thousand, or $34,000 per year.

Packing——	3/16 in.	1,000 per bundle
	1/8 in. to 5/16 in.	500 per bundle
	3/8 in., 7/16 in. and ½ in.	200 per bundle
	9/16 in., ⅝ in., 11/16 in. and ¾ in. ...	100 per bundle
	7/8 in. and 1 in.	50 per bundle

Clothes pegs.—These goods are only made in the United States and Canada, for the reason that timber grown in other countries is not suitable. It is considered that the United States has 80 per cent. of the trade. The average yearly imports have been 902,777 gross at 2s. per 5 gross case; in all about $90,275.

Skewers.—While this article is not very profitable to the manufacturer, large quantities are made in the United States, and to a certain extent in Canada, the reason being that it is necessary to use maple or hickory, and these woods are not grown in other countries.

Cabinet turnery.—Although up to now Canada has not exported very much of this class of wood product, there is no doubt whatever that we could do a large and profitable business in this direction. Under this heading may be included Windsor legs, fore feet, spindles, couch and table legs. These goods are usually imported from Austria, Scandinavia, and Finland.

Pastry boards.—Canada has a fair share of the better class trade, on account of having the most suitable timber, basswood. The cheaper

boards, as produced in Germany and Sweden can easily be made profitably.

Tool handles.—File and chisel handles made from beech, birch and ash, mostly come from Germany, Scandinavia and the United States. Hickory pick, sledge and hammer handles and ash hay fork and rake handles are imported chiefly from the United States. Canada is capable of producing the latter class at least. Such Canadian handles as do enter the British market give every satisfaction.

Other articles required in Great Britain are plugs for paper mills, rolling pins, spring clothes clips, towel rollers, parts for toys such as balls, wheels, reels and picture blocks, tea trays, ladders, coat hangers, knife trays and box boards. Samples of all the foregoing can readily be secured by the Canadian Trade Commissioners.

The government and the manufacturers of Canada have given much thought to this subject of small wooden goods, and it will require still much more. It is full of possibilities for our own people, who will adapt themselves readily to this work and find the material at hand.

The difficulties in the trade itself can no doubt be remedied. The country people of Canada have always, by hand, in their own home, made the very best of axe handles, toboggans, sabots, etc., all of which require ingenuity and skill—more indeed than any of the articles comprised under this heading.

Centralizing and specializing, as suggested, may be useful, but will probably not prove altogether sufficient to implant the industry of these smallwares in Canada. It could rapidly be disseminated in thousands of homes by the exhibition of models, and the assurance that the production could be sold at a reasonable price. It would be unwise to depend exclusively on the production that will result from the labor of factory hands, from obtaining large quantities of raw material, and from elaborate modern equipment. These advantages alone will not conquer and hold the business in a way profitable to the community. An appeal for the employment of the idle moments of our long winters by the people at home, who do not depend on the immediate wage payment of time occupied and material employed, might result in a large production.

To promote this idea, technical schools might be brought into cooperation, and primary schools also be organized to cultivate large production. This development would also demonstrate the value of our forest products when used in this line of industry. The marketing of this product should not involve any more difficulties than the wheat crop, the fruit crop, the fisheries, etc. When we are assured of an outlet we should not stop to doubt that the purchaser will appear.

If Canadians bear in mind that every year five times more of our forest resources go up into smoke than are cut and made use of; and that 60 per cent. of what timber we cut goes into waste, then surely it is time to face the question in as many ways as can be suggested and work hard on it.

The French Market

France consumes, every year, an enormous quantity of all classes of lumber products that Canada can furnish. In 1912 French imports in sawn timber and lumber, from countries subject to the same customs tariff as Canada were valued at 200,000,000 francs; in 1913 the amount was even greater. After the war, this demand will increase prodigiously on account of the necessity of building temporary shelters and of re-building destroyed property. It must be remembered that France has retaken from the enemy 753 towns (communes) containing 16,669 houses that must be completely reconstructed and 29,584 that need repairs; it must also be borne in mind that there are now 247 towns on the firing line and 2,554 towns at present occupied by the enemy, This referred to conditions in July, 1916.

In considering the question whether Canada can successfully compete for this trade, it is important to note that she has one incontestable advantage over the United States in enjoying the minimum tariff on manufactured wood, while they pay general tariff. The present supplies are received mostly from United States, Russia, Scandinavia, Switzerland and some through England, but none of these countries have any preference over Canada in custom duties.

At the present time, in spite of the exorbitant increase in freight rates, there is a large and varied demand, as is proven by the unsolicited offers received during the short stay of the Commission in France.

In ordinary times the freight from Riga costs 30 francs per 1,000 feet, whereas from Nova Scotia the average is 50 francs. The port of Bordeaux handles large quantities of timber for mine props. This class of timber comes from the forests of Landes, France, and is a resinous maritime pine, lifeless and unfit for any other use. It brings 23 francs per ton and England buys all that can be supplied.

Woodenware.—There is a very general demand for small woodenware, such as dress hangers, towel rollers, washboards, shuttles, etc. However, low prices governing the market and high tariff duties prevent Canada from taking advantage of this trade for the present.

Ties or Sleepers.—An unlimited and continuous demand exists. Our Douglas fir is extremely abundant and in our opinion well suited for the use; samples have been sent to some of the railway companies in France. A test was made by these companies and the result thereof was embodied in two reports from their chief engineers on the 23rd of May and June 8th, 1916. (These reports are now in the hands of the Commissioner General in Paris). Although these reports are favorable as to the durable qualities of the wood, they are unfavorable as to its capacity for the retention of spikes. This objection, and the experiments upon which it is based, do not seem to justify the disqualification of our lumber for such purposes, especially when its primary quality, that of durability, is conceded to be excellent. To extract a spike from a sleeper immediately after it has been driven cannot conclusively show the grasping and retentive power of the timber. But even admitting that it does, then why not overcome the difficulty by using special spikes entailing no greater cost? The great point gained by sending the sample is that both the railways have agreed to try the sleepers in actual use where it is expected they will show their real value.

It is evident that France cannot supply her own requirements. The policy adopted throughout France for the conservation of her forests, to cultivate them and to cut only as much as can be produced each year, necessitates the purchase elsewhere of the wood she needs for building purposes, etc. A change in this policy would bring about a revolution in France, where whole districts (communes) pay their taxes from the annual revenue from their forests, and in some cases even distribute a considerable surplus among the inhabitants.

Before the beginning of hostilities the lumber merchants of Canada were satisfied with the profits to be derived from the local market and exportation to England. The trade was carried on without effort and with happy results. Necessity had not forced them to seek new markets which they did not need in order to completely dispose of the limited quantity produced. Thus we have, in the first place, the absence of necessity and lack of interest on the part of the Canadian merchants. Furthermore, the conditions under which lumber is sold on the French market are totally different from those existing in Canada. The metric system of measurement is no more understood here in the Dominion than is the Petrograd standard of measure. It must even be admitted that the value of the franc is little known. The same is the case with the weight of wood in kilos. We are not in the habit of furnishing samples. It is a trouble to obtain information as to freight and insurance. Such are the obstacles that the care-free prosperity of our lumber merchants has made no effort to overcome.

In contrast to this apathy we find the constant and ingenious activity of our competitors. The timber merchants of the United States, trained and equipped by a close study of commercial methods, do not hesitate to cross the sea with their samples, in order to make known the value of their products, and, as a result, they make large sales.

The English agents who have always made a specialty of exportation and transportation of all kinds of goods, are willing to make special terms for freight, to sell, using the system of measurements the most convenient for the customer and to compute their price in francs or in shillings, as the case may be.

The Germans, who carry on their commerce in a scientific manner, provide themselves with handbooks, in which may instantly be found the price of lumber per thousand feet, be it computed per standard or per cubic metre—in dollars, in pounds sterling, in francs, or marks, etc. In these handbooks may also be found the weight of the various species of wood in order to facilitate estimating the cost of freight. Finally, we there find the average rates of exchange. Armed with this guide, the salesman, who needs only to learn the names of the species and the qualities most in demand, passes often for an expert and impresses the French consumer.

Very little Canadian wood is sold on the French market because it is almost unknown, and, what is worse, in the few places where it is known it has the reputation of being of very inferior quality. This seems hard to believe, but it is only the strict truth. It can be explained by the fact that the Canadian lumber exported has been sent almost exclusively to Great Britain and when, from time to time, it was sent from that country to France, it lost its name and passed as the product of other countries. This was the case with our fine woods that brought high prices. It must be admitted, however, that certain shipments of Canadian wood of a most inferior quality were unloaded on the French market at low prices because they could not be disposed of elsewhere. Such proceedings have caused incalculable harm to the reputation of our products. Unfortunately, our exports of high quality lumber have not been able to counteract this undesirable reputation, since they have always been credited to other countries. At Contras, near Bordeaux, the following sign is displayed on a large lumber factory: "Bois de l'Amerique du Nord" (North American Wood). It is evident that in France, Canada does not exist as a separate country, only "American" products are known.

THE pulpwood trade of the province of Quebec has become so large during recent years and covers such an extensive territory as to be overshadowing the lumber industry in some localities. Numerous manufacturers of lumber who have operated sawmills for many years past have been devoting their efforts and equipment for a year or more to the production of pulpwood, claiming that in this business there is to-day a greater profit.

Some of our readers are fairly familiar with the pulpwood production industry, but there are others, particularly those located west of Quebec province who have not had an opportunity of learning how the operations are carried on. The Canada Lumberman is fortunate in being able to present a description of the method of operation as now conducted. This has been prepared for us by a pulpwood operator of many years' experience. In reading what follows it is important to bear in mind that on May 1st, 1910, a law came into force in the province of Quebec making it compulsory that all timber cut on Crown lands shall be manufactured in Canada, that is to say, converted into pulp or paper, deals or boards, or other articles of trade or merchandise of which such timber is the raw material. This law also contains a clause to the effect that timber simply cut into lengths, piled, barked or otherwise worked preliminary to the manufacture of pulp and paper, deals or boards, etc., should not be considered as "manufactured" within the meaning of the regulation.

Before this law was put into effect, most of the larger operators in Quebec province converted their small logs into rossed pulpwood, and as a matter of fact some of the larger American companies operating pulp and paper mills in the United States had large rossing mills in Quebec province when the law came into effect. This business then came to an end and such pulpwood as is now exported is cut on Seignioral or deeded lands, known in the province as "freehold lands." Some of the large American companies met the situation after 1910 by purchasing large areas of these "freehold lands," from which they have been exporting peeled pulpwood in large quantities annually.

To-day the quantity of rossed pulpwood exported from the province of Quebec is very small compared with the quantity exported previous to 1910, and nearly all of it is known as "peeled wood." This wood is peeled from May to August when there is lots of sap in the tree. Later on, it is cut into 4-ft. lengths. In the winter it is hauled to railway sidings or to rivers. Most of this work is carried on by farmers or settlers on their own lands. The cost of felling, peeling, sawing into 4-ft. lengths, making roads, piling, and finally hauling out on winter roads now varies from $5 to $6 per cord of 128 or 144 cubic feet, depending upon the district where the wood has been cut. In some sections the English measure is used and in some sections French measure. Nearly all of this work is done by contract in cases where companies own their freehold lands, and even some of the settlers and farmers have their work done in this way. The price paid during the winter of 1916-17 in one of the more important pulpwood producing districts of the province was from $9 to $13 per cord of 128 cubic feet, loaded on the cars. There was considerable increase in the price from the time the first wood was sold in December, 1916, up to April or May, 1917, thus accounting for the considerable range above quoted. Prices paid for pulpwood vary to some extent according to the freight rate from the loading point to the mills in the United States. The present high prices are chiefly the result of shortage of labor. Those who are closely in touch with the situation are expecting the price of pulpwood to continue strong for some time to come.

One of the interesting effects of the law passed in 1910 regarding manufacture of raw material in Quebec province has been the artificial stimulation in the market value of freehold lands. As pulpwood could be exported only when taken from lands of this kind, there immediately developed a great demand for them and their value began to advance, and is still advancing and they are very difficult to purchase.

The contract system under which most of the pulpwood logging operations are carried on in Quebec province is quite a different matter from the ordinary logging operations in lumber camps of Ontario and other parts of Canada. For this reason the following descriptive details will be instructive and interesting to many readers.

In the province of Quebec, most pulpwood operations are run on the contract plan. Companies have found that they can thus manufacture their pulpwood more cheaply than by having their own crews in the woods. In surveyed townships the unit of operations is the lot, which is usually one hundred or two hundred acres. The smallness of the unit is of advantage in supervising contractors. A contractor is not necessarily restricted to one lot, of course. In unsurveyed districts, the boundaries of the unit of operation are usually blazed. Surveyed and mapped areas are most easily handled.

Early in the spring the prospective contractors, or jobbers, as they are called, come to explore the available jobs. Usually the contractor undertakes the entire job of landing the pulpwood on the river bank. Sometimes he may undertake only the peeling and sawing, while another, later, undertakes the hauling.

The company finances the operation. For peeling, the advance is usually one dollar and twenty-five cents per cord, and for sawing, about the same amount. The contractor receives these advances as the work proceeds, and his work is inspected, about once in two weeks. For hauling, no payments are usually made until enough wood has been hauled and scaled to offset advances made for peeling and sawing. In operations not located near settled communities having stores where the contractors may buy their supplies, the company has to furnish them. For this purpose the company maintains depots or storehouses. Also under these circumstances the company usually pays the workmen their wages. Both the contractor's store bill and his men's wages are deducted from the advances. All this entails keeping sharp watch of the contractor's accounts. Of course, at the beginning of the operation, while he is building the camps and doing other preliminary work, the contractor is in debt to the company. It is sometimes a difficult task to decide just where a contractor must get out of debt or be left to his own resources. The average jobber has but little means, and consequently has to shut up shop if the company refuses to make advances. It is, of course, much safer for the company not to furnish supplies to jobbers, when other arrangements can be made.

The Contract System

The contractor who undertakes a contract from a company usually turns around and sublets as much of his job as possible. He sometimes succeeds in subletting all of his area, but more often he has to operate the least advantageous parts himself. Into these parts he sends crews hired by the month.

The sub-contractor undertakes the peeling, sawing and hauling at a price that leaves a profit for the general contractor. On the poorest locations this profit is almost nothing, on the better locations from twenty-five to seventy-five cents per cord. On the portion that he operates himself, the general contractor may make nothing. Sub-contractors sometimes undertake only the peeling and sawing, especially on small parts of the operation. Several of these small jobs are united to form a hauling job. Peeling begins in May and continues up to the last day of July or into August, depending on weather conditions and situation of timber. Dry weather or dry situations are not favorable to late peeling.

Peeling crews ordinarily consist of two men and three-men crews are used more or less, and rarely one-man crews. Where the timber is small one man can fell and peel well enough. In a two-man crew, one chops and the other peels. The chopper trims off branches, and, if the peeler aids the chopper in felling the chopper is the one to lift the "strip" along the upper surface of the tree. This strip is necessary for inserting the peeling spud under the bark. Crews adjust the work to suit themselves. In three-men crews the peeler has only the peeling to do. However, it is rare for a peeler to keep up with two good choppers.

Most contracts call for felling with a saw. Because it takes the peeler away from his work to help in felling the men's inclinations are against using the saw, for it makes an extra tool to carry around.

One-man saws are used in some operations. These are similar to large hand saws; they have a second handle fitted just ahead of the usual one. This handle is fixed to the back of the saw and is detach-

able. The writer has seen this tool used only in small timber where one man was working alone. A home-made peeling spud consists of a flat piece of iron ¼ in. x 1¾ in. x 15 in.; one end is slightly sharpened and turned up.

Properly peeled pulpwood is free from bark, and all branches or knots must be trimmed close to the surface of the tree. It is difficult to prevail upon workmen to observe these specifications. It requires considerable care to trim closely the branches on the underside of a tree. The bark on the underside of a tree where it rests upon another is often left. In some districts the contractors are required to have all trees topped and turned as they are peeled to ensure proper peeling and trimming of the under side of the tree. Some claim that sawing off the top renders the tree more unstable and therefore more difficult to saw up. Trees are peeled to three inches in the tops.

Some contractors blaze their roads before beginning to peel. The timber can then be felled with regard to subsequent steps of the operation, and thus, of course, the timber is likely to lie more advantageously for sawing and road making, than when roads are blazed later, for, a tree standing in the road may be felled close to the ground, thus saving the road makers the work of sawing off the stump.

The Piece Work System

On some operations contractors have tried the piece work system for peeling, that is, the crew is paid by the cord. To do this the contractor must keep a count of trees peeled by each crew and also he must determine the average number of trees per cord for each crew. Given the usable length and mid-diameter of a tree the contents in cord feet may be obtained from tables published for that purpose. A steel tape is used for measuring the length, and calipers for measuring the diameter. Counting from 1,500 to 2,000 trees is a day's work for one man. On the days when he measures, the counter needs an assistant. In the hands of most contractors this system does not work out well because they do not engage proper men for the work. It requires careful, honest work on the part of the counter. While the result is never altogether accurate, the system can be worked advantagously, for, unless there is some check on the amount of labor done by each crew, peeling is costly.

Some contractors merely count the trees and average the number of trees per cord by estimate. Men of experience can do this fairly well.

As soon as the peeling season closes, the sawing begins. Usually two men saw and a third piles, at the same time removing bark and trimming knots overlooked by the peelers. When timber is scattering the piles are small, one-half cord or so. In heavy stands the piles are larger. The piles are usually four feet high for convenience in measuring; they should run along the road and not at right angles to it, as the wood is then more easily loaded. If roads are blazed before sawing time the piles are better located. All piles should be substantially made so that sticks will not fall and be buried in the snow and lost. Unless skids are placed under the piles the lower sticks will freeze into the ground and probably remain there.

The least possible time should be wasted in handling cull timber. A tree cut up into four-foot bolts, each of which is cull, is evidence of wasted labor. If the piles contain cull sticks the waste of labor is still greater. A tree suspected of being unsound should be tried in several places by the sawyers but not sawn through unless sound. Careless sawyers saw wood too long or too short. Large knots sometimes interfere with sawing. In that case the bolt should be sawn a little longer rather than always shorter.

Contractors generally measure every few days to see what their crews are sawing per day. Some crews are paid by the cord for peeling and sawing, the wood being measured in the woods.

Road Making

Road making is a comparatively short job. The lay of the land decides for the experienced man the location of his main road. There is a multitude of branch roads. In locating these the contractor has to limit himself to as few roads as possible, for beside the cost of making, there is the cost and trouble of breaking them out in deep snow. On the other hand, he must manage to pass his road by each pile or else have his men carry the wood to the road before snow fall. It is disastrous to leave piles of wood far from the road to be brought out in three or four feet of snow. Good pilers foresee the location of the road and place the wood on it, even if they have to carry the wood some distance.

In light stands of pulpwood it is not practicable to make many roads, consequently wood is yarded, that is, horses are put in to drag the timber in tree lengths to places along a proposed road, where the sawing is done. As compared with sawing at the stump, sawing in yards results in fewer roads, larger piles, and speedier sawing. On the other hand, yarding entails the extra cost for horse labor, driver, and sometimes for a swamper to make a path.

When the stand is from two to four cords to the acre, yarding is best. In rough country it is sometimes best to yard even in fair stands. All roads must be well blazed or there will be trouble in finding branch roads in deep snow. A small crew is used for road making. Hauling ought to begin as early as possible. The jobber who hasn't taken much pains with his roads has to wait until there is a great deal of snow to make hauling possible over his rough roads.

Soon after there is snow enough there is usually too much. Deep snow wears out horses in breaking roads, and it invokes much shoveling out of piles. As the snow deepens the roads rise high above the bottom of the piles. Lifting heavy bolts from the bottom of a hole onto sleds is slow, hard work.

Swamp roads are likely to be flooded at every thaw, consequently it is not a good plan to count on late hauling in such situations.

The usual rig for hauling is a set of sleds upon which a rack is placed, the rack has stakes at the four corners and the bolts are piled across the poles of the rack, that is, crosswise of the road. Peeled pulpwood is slippery and will slip off the load at the first opportunity. Binding chains are used sometimes. Two cords are usually a good load for a two horse team. The use of one horse hauling rigs still continues in some regions, but is giving way to two horse teams.

Piling the Wood

Pulpwood is usually piled on the river bank, but sometimes on the ice. The height of the piles is either four or six feet, rarely eight. Skids are placed under the piles unless wood is piled on the ice. Space permitting, it is preferable to pile but one tier on either side of a river. When more than one tier is piled on one side of a river, space must be left between tiers for inspection of wood. The more tiers there are the farther away from the river the wood is, of course. When jobbers are obliged to throw the wood in themselves at driving time they are usually careful not to have wood too far from the stream. In fact they are apt to place the wood just as near as they are allowed. Some companies require the contractors to do the throwing in and others have the throwing in done by drive crews, or by separate contract.

Piling wood on the ice has the advantage of eliminating the throwing in, but on many streams it is not good policy because it makes driving costly. In spring jams of ice dam the stream and then the pulpwood floats over low banks and makes "rear" to be picked up. When the rolling is included in the contractor's work twenty-five cents is held back for rolling. Contractors do not like to do the rolling, as it requires them to hire men for a few days only, at a time when such men wish to be river driving.

Of the cost of operating this year there is not much that can be definitely stated, for it is not at all uniform even in the same localities. On the whole contracts have been let at great advances over last year. For instance, a contract that would have been given for four dollars last year calls for about seven this year. For piling and sawing four and four-fifty is being paid, and even more.

In conclusion, the writer wishes to state that after ten years' experience in having wood made by contract, he has found it a business requiring force, constant watchfulness and honest dealing to make the contract system work out satisfactorily.

Details of the organization for letting contracts, inspecting, scaling, driving and loading, the writer has left for a later paper.

Upsetting Old Ideas of Logging

Are scientific methods and mechanical improvements to be forever debarred from logging operations? asked D. C. Magnus, at the recent Appalachian Logging Congress.

"Are we, as loggers, keeping pace with the other great industries of the world? Is it not a fact that the lumberman is being outstripped by his own industrial competitors? He must do more of the work with power-driven machines.

"For instance, the sickle, the knitting needle, the old hand-looms, the needle and thread, the coal pick, and the cross-cut saw were all rocked in the same cradle. The sickle has developed into a reaper, the knitting needle into a great factory filled with humming spindles, the needle and thread into a sewing machine, the coal pick into a coal cutter, and the old cross-cut saw has remained a hopeless case all these years.

"Is it possible for the old cross-cut saw to form an armor that cannot be pierced by the scientific brains of this age?

"The cross-cut saw is not the only tool to which we should bow our heads in shame. Several weeks ago we were moving earth for a railroad grade and found a kit of stone tools that were used by some prehistoric race. Among the number there was a stone axe. This axe was similar to the one we use to-day, with the exception of being stone and having the handle attached on the outside. Is it possible that we must cling to that old stone model forever Should we not make some great effort to get an electrically-driven tool to replace at least a part of its uses

"We are living in an age when it requires a number of individuals

to compose an efficient unit. The backwoods cabins are becoming landmarks and the cave of the hermit a curiosity.

"Co-operation and concentrated effort must be introduced if we would have our ideals become realities.

"The loggers realize that they can't compete with the other industries. They should begin now to fortify themselves against the future labor problems which are sure to come.

"The time has passed for a lumberman to be content to have a man at the helm of the logging end of the business who is not worthy of a greater title than 'bush man.'

"A shrewd business man said to me after going over a logging operation: 'I am surprised to learn of the responsibilities of a logging superintendent. To be efficient he must be a timber cruiser, machinist, civil engineer, diplomat, and psychologist.'"

"The lumberman's slogan should be 'Scientific logging,' and he should put forth every effort to get men to conduct it on scientific lines."

Making Life Pleasant for Camp Communities

Sometimes, when the permanency of a logging camp renders it possible, great results are obtained by providing generously for the welfare of the loggers, in ways that at other camps are not possible. A case in Idaho is typical, where a community by the name of "Rose Lake" has been called into being by the lumber industry.

As the group of people thus drawn together grew, it struck the resident manager that an industrial Y. M. C. A. would help business, because happy, contented folks work to greater profit than the other sort. So he made application to the Industrial Secretary, who sent him a man to start the work and remain in charge. That was last October, and the Secretary's report now contains some interesting facts that show what a small sum of money can do.

From one hundred and five last November, the membership had reached one hundred and eighty-three in June, this increase gives an addition of twenty-seven men members; 100 per cent. increase in boys' membership with a growth of the ladies' auxiliary from ten to forty-eight.

The money which did this was only $3,468.42, of which the employer furnished a thousand dollars, the employees the balance, which includes $700 raised by the men to equip the building for its numerous activities.

In April a moving picture machine was purchased from funds in the treasury which, together with the rental of films from May to June, came to $283.90.

Bowling and basket ball are popular with both men and women, who learn to play well under the training of the Secretary, who is also physical director. The bowling alley report shows a total of 13 989 games played during the ten months' life of the association.

For the happiness of the women folks the manager installed a complete bath room for their exclusive use—theirs and the children. Few homes in a place like Rose Lake can boast of a bath with hot and cold water, so the mother-members bring the children to the Y. M. C. A. to enjoy that necessity.

The Secretary's wife is organist or pianist, as the case may be, at the religious services held every Sunday in the auditorium. A minister comes to assist every other Sunday and every Sunday the Secretary teaches a bible class.

An Enormous Log Jam in Sweden

Canadian lumbermen know a great deal about log jams, and Canadian loggers can tell an endless line of stories about them, but it looks as though they will all have to give first place to the great log jam that is now worrying all the lumbermen on the Glommen River, in Sweden. A quantity, estimated at about 450,000 dozens of logs, have piled up at Bingfoss lock, almost inextricably, to an enormous height, and it is only possible to extricate the logs one by one with immense work and difficulty. Instead of employing as usual about 20 to 30 men, the association has now 130 men engaged, who work day and night to try to loosen this mighty mass of timber. Although everything has been done to stop more timber from coming down to Bingfoss, the river still carries a great deal of timber, and the quantity at Bingfoss is thus steadily increasing. As the situation now is, it is hardly possible to clear the quantity of timber at the Bingen lock in a shorter time than two years, and there is no prospect of being able to release this year much more than one-half of the quantity of timber which has been marked this season for being floated in the Glommen River. This very serious situation will prevent not only the mills, but also the many parishes who have bought timber in lieu of coal, from receiving the timber which has been cut and marked for their account for being floated in the Glommen River. This is an event without parallel since floating of logs in the Glommen River commenced, and it will affect the planing mills at Fredriksstad and all the other mills which are situated on the Glommen River.

Extensive Quebec Manufacturers

St. Maurice Paper Company's Lumber and Pulp and Paper Plants—Two Thousand Men Employed in the Woods

Among the lumber and paper companies of the Province of Quebec, one of the most extensive and well equipped is the St. Maurice Paper Company, Limited, successors to the Charlemagne and Lac Ouareau Lumber Company, the Gres Falls Company, and St. Gabriel Lumber Company, Limited, with head office in Montreal.

The timberland holdings of the company exceed 1,300,000 acres, and are situated on the St. Maurice, Assomption, Ouareau and Mastigouche Rivers, with saw and pulpwood mills situated at Three Rivers, at the mouth of the St. Maurice River; Charlemagne, at the mouth of the Assomption; and St. Gabriel de Brandon, on Lake Maskinonge.

Under normal conditions their annual cut on these rivers amounts to about 65,000,000 ft. B.M., including pulpwood for their new pulp and paper mills, which are situated at Cape Madeleine, about three miles from Three Rivers. Practically all is cut by jobbers, and is chiefly spruce and white pine. It is estimated that a force of 2,000 men is employed in their woods operations.

On the St. Maurice River the logs are driven by the St. Maurice River Boom and Driving Company, Limited, which drives all the logs made on this river and its tributaries, from La Tuque to Three Rivers, the total quantity driven annually being about 200,000,000 ft. B.M.

The company's lumber mills are equipped with the most modern machinery, that at Three Rivers being built in 1915, replacing one destroyed by fire. Its equipment consists of double cut and band saw, twin circulars, circular band, horizontal re-saw, edgers and trimmers. The lumber is hauled by an electric locomotive over a tramway 700 feet long to the piling ground, whence shipments are made by car and ocean steamships.

The pulpwood mills are all equipped with cutting up saws, Ryther and Pringle slashers, barking drums and other modern machinery for cutting and preparing pulpwood. St. Gabriel and Three Rivers have direct railroad connection with the paper mill, and the wood from Charlemagne is transported by means of a tug and a fleet of barges of 360 to 400 cords capacity.

The combined capacity of the lumber mills is 350,000 ft. B.M. daily and the pulpwood mills cut up 750 cords daily.

The pulp and paper mills at Cape Madeleine are just completed, and consist of the wood room, equipped with two Carthage chippers with conveyor feed arrangement, horizontal shaking screens, and long belt conveyors leading to the chip bins in the sulphate and sulphite mills.

The sulphate mill, with the recovery and alkali rooms, includes in its equipment Swenson evaporators, melting furnaces, revolving incinerators, disc evaporators, etc., six diffusers and two digesters (Continental). The capacity of this mill is 60 tons daily.

The sulphite mill is equipped with two Manitowoc digesters with Jolbert lining and the usual accessories. The acid plant is in a separate building, containing lime and sulphur storage, rotary sulphur burners, coolers and complete barker reclaiming system. The capacity of this mill is also 60 tons daily.

The ground wood mill is entirely electrically driven, the three lines of five grinders each, 15 in all, being each driven by a 1200 h.p. motor. The stock is pumped to the screen room, which is fitted with vertical quiller screens. Excess of ground wood not used in the paper mill is taken off eight Sherbrooke wet machines and hydraulically pressed. The daily output is 100 tons.

The paper mill is equipped with two Pusey & Jones 166 in. paper machines with 60 in. dryers, running at 635 feet, driven from the basement with a drive of the English cotton rope type, each machine being driven with a Terry steam turbine. The capacity is 100 tons daily.

The boiler house contains six 500 h.p. B & W water tube boilers with superheaters, chain grate stokers, Greene fuel economizers, etc., and overhead storage bunkers of 700 tons capacity.

Much of the equipment in the different plants of the St. Maurice Paper Company consists of the well-known machinery furnished by the Waterous Engine Works Co., Ltd. Brantford, Ont.

Mr. J. O. Castle, manager of the factory of Castle & Son, makers of shell boxes and furniture, Montreal, died on July 24, after a short illness.

A change has taken place in the personel of the Graddon Lumber Company, Ltd., Montreal. Mr. C. B. Graddon, president of the company, has purchased the interests of Mr. W. T. Owens and Mr. James Buchanan, the latter of whom has been ordered a rest for three months, owing to illness.

Quebec Cullers' Report

The following comparative statement of timber measured and culled to date is furnished by the supervisor of cullers, Quebec, P.Q., under date of August 6:

	1915, cu. ft.	1916, cu. ft.	1917, cu. ft.
Waney white pine	341,680	118,960	84,240
Oak	90,880	221,400	70,400
Elm	46,840	69,440	98,640
Ash	840	1,680	320
Butternut	.....	40	.....
Birch and maple	48,880	46,880	15,880
Pitch pine	.....	.....	41,230
Fir	.....	.....	36,490

Link-Belt Mono-Rail Hoists Again Available

The Link-Belt Company, who have factories in Chicago, Philadelphia and Indianapolis, and sales offices in the principal cities of the United States, report that they are again able to furnish Link-Belt Mono-rail Hoists for quick shipment. For about a year past they have been unable to produce this line, on account of the over-crowded condition of their shops and the unprecedented business conditions.

The Link-Belt Mono-rail Electric Hoists are manufactured by this firm at their Philadelphia plant, where a large additional building is rapidly nearing completion, and the excellent manufacturing facilities of the plant are being greatly increased. One of the accompanying illustrations represents a partial line up of C-1 machines in the assembling department. Both types C-1 and C-2 machines can now be furnished. Their safe lifting capacities range from 1,000 lbs. to 6,000 lbs. They can be adapted for either direct or alternating current and fitted with plain, hand geared, cord-operated motor or a case-operated motor trolley.

The company report that there is an unprecedented demand for electric hoists and a great probability that the available stock will be exhausted quickly. Practically every industry in the country is now working at top-notch capacity and electric hoists are helping to expedite production everywhere. The entrance of the United States into the great war will increase the use of all such labor saving appliances, which will do the work of many men who are called to the front.

Another illustration represents a direct current plain-trolley hoist handling boiler cores in a foundry, before they have been baked. The company claim that the Link-Belt hoist is the first Mono-rail machine to employ a dynamic braking system for controlling the lowering speed. Dynamic lowering provides the delicate variable speed control that is so essential in foundry work of this kind.

Among the other good features of this hoist are the small amount of head room required; the weatherproof and dustproof construction; the accessibility of the working parts; the simplicity and ruggedness of the hoist gearing; automatic oil bath lubrication; renewable bronze bushings throughout and its safety-first construction.

The third illustration represents a hoist handling pulleys in a pulley manufacturing plant. Other machines are working in ice plants, boiler houses, machine shops, steel plants, coal tipples, etc. In one paper mill eight C-1 machines are used for handling rolls of paper. In another a cage operated hoist is employed for handling ashes from the boiler room to the cars. Other mills are using them for handling cars of wood pulp, casks of clay and miscellaneous materials.

The Link-Belt Company have a new electric hoist catalogue on the press and will be glad to send copies to interested parties upon request.

The Canadian representatives of this company are the Canadian Link-Belt Company, Limited, 265 Wellington Street West, Toronto.

Canada's Foreign Trade in Wood Goods

Canada's imports of planks, boards, etc., sawn, split or cut and dressed on one side only during the twelve months ending March, 1917, were valued at $1,326,851. During the corresponding twelve months of 1916 the value was $1,007,330, and for 1915, $2,322,368.

Pitchpine imports during the same periods were valued as follows:—1917, $644,812; 1916, $722,358; 1915, $1,608,788.

The total imports of unmanufactured wood during these three periods were valued as follows:—1917, $7,209,242; 1916, $5,459,118; 1915, $9,803,975.

The total value of imports of wood and manufactures of wood during the three years was as follows:—1917, $11,489,761; 1916, $8,672,422; 1915, $14,495,093.

Canada's exports of spruce and other deals during the twelve months ending March, 1917, were valued at $10,354,628. During the corresponding period ending March, 1916, the value was $9,679,385, and for 1915, $6,393,420.

Exports of planks and boards during these three periods were valued as follows:—1917, $25,982,442; 1916, $23,885,932; 1915, $18,939.295.

The total exports under the heading of lumber during the twelve months were valued as follows:—1917, $47,586,148; 1916, $43,363,332; 1915, $33,239,679.

The total value of exports of unmanufactured wood during these three periods was:—1917, $56,352,330; 1916, $51,627,977; 1915, $43,076,250.

The total exports of wood and manufactures of wood for the three periods were valued as follows:—1917, $77,797,498; 1916, $63,456,058; 1915, $53,284,085.

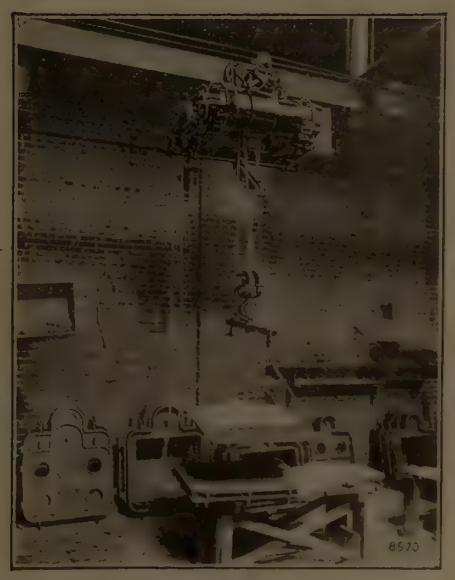
Canada's exports of forest products during the twelve months ending June were valued as follows:—1917, $56,518,595; 1916, $53,259,354; 1915, $43,288,935.

Teeth of band saws that are too long chatter in the cut and sometimes cause fractures by throwing undue strain on the blade at the root of the teeth. Never let the saw come in contact with the back guard wheel, as case hardening is bound to ensue, from which cracks will surely result. In case saw is forced against the guard wheels and case-hardened, remove the glaze at once by holding a piece of soft emery wheel against the back edge while saw is slowly running, or by draw filing.

Lumber shipments by twenty-five mills as reported to the Northern Pine Manufacturers' Association, amounted to 91,989,217 feet for June, as against shipments of 99,703,922 feet by thirty mills in June of last year. The shipments for the first six months of the present year were 426,867,626 feet, as against 497,077,614 feet for the first half of 1916.

Link-Belt Mono-rail Hoist handling pulleys in a factory.

In the assembling room—a partial line up of C-1 machines.



Handling boiler cores in a factory.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 20th of each month to insure insertion in the subsequent issue.

Wanted–Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

Squares Wanted

Seasoned Birch and Maple, No. 1 Common, also 1sts and 2nds. Size 5 x 5 and 6 x 6.

Huntley Mfg. Company, Limited.
15-16 Tillsonburg, Ont.

For Sale–Lumber

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.
400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce. Piled widths and lengths separate.

GEO. C. GOODFELLOW,
c Montreal, Que.

Oak Bending Plank

We can cut and ship promptly three or four cars per month of good tough oak bending or implement plank any thickness you need. Write us.

C. W. TUNIS LUMBER CO.,
16-16 Cincinnati, Ohio.

For Sale

100,000 ft. 1 in. dry Cull Birch.
150,000 ft. 3 x 6, 6/16 ft. dry Sixth Quality Spruce.
200,000 ft. 1, 2 and 3 in. C. Cull White Pine.

FRED T. SMITH,
310 Board of Trade Bldg.,
14-17 Montreal, Que.

For Sale–Machinery

For Sale

Band saw-mill machinery in our Saw-mill at Lakefield, Ont. Two complete units. Shafting, pulleys, three boilers, etc. For particulars apply The Dickson Co., Ltd., Peterborough, Ont. 15-18

For Sale

Corliss Engine, Waterous Engine, Steam Pump, Hot water Heater, Steam Trap.

DELANEY & PETTIT, LTD.,
16-16 Toronto, Ont.

For Sale

43 Steel Trucks, 2 Transfer Trucks, with flat steel tops, 36-in. gauge, roller bearings; 360 yards 30-lb. rails. All good as new. Apply Room 622, Transportation Building, Montreal. 16-16

For Sale

One latest improved Wickes No. 10 52-in. Gang, complete with saws and filing equipment, 1 Kilgore Cant Crane, Steam Board Flippers.

GOODMAN LUMBER COMPANY,
15-t.f. Goodman, Wis., U.S.A.

Machinery and Dry-Kiln Outfit For Sale

Planer and Matcher.
Power-feed Rip-saw.
25 H.P. Motor. d.c.
Heavy Door and Sash Clamp Glue Heater.
Grand Rapids Dry-Kiln Outfit (never been used)

HALEY & SON,
15-t.f. St. Stephen, N.B.

For Sale
Logging Railroad Equipment

Five hundred tons relaying rails and fastenings, mostly 56 lb.

One Shay gear locomotive, 70 tons (coal, wood or oil burning).

One Shay geared locomotive, 40 tons.

Two steam log loaders (derricks).

One Raymond Gasoline Log Loader.

Forty flat cars, 60,000 lbs. capacity, with air brake equipment.

One Empire Logging Donkey Engine (from Vancouver). Unloads a half car of logs at one time. Very powerful.

And other material, all in first class condition. Located in Ontario. Delivery September to November, this year.

GEO. H. HOLT,
926 Manhattan Bldg.,
16-17 Chicago, Ill.

Wanted–Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED POSITION as woods foreman or licensed log scaler. Best of references. Box 1105, Welland, Ont. 16-17

EXPERIENCED ACCOUNTANT wants position as clerk in a logging camp. Apply Box 614, Canada Lumberman, Toronto, Ont. 16-16

PRACTICAL LUMBERMAN, experienced salesman and capable office man is open for immediate engagement with reliable wholesale firm or manufacturer. Good references. Box 608, Canada Lumberman, Toronto, Ont. 15-16

A PRACTICAL LUMBERMAN, forty years old, with twenty years' experience, is open for engagement June 1, 1917. Last ten years with very large Canadian firm as superintendent and sales manager. Best of references. Box 496, Canada Lumberman, Toronto, Ont. 2-18

WANTED POSITION as Band Saw Filer or mill superintendent, having 25 years' experience on band saws and mill wright. Will go anywhere for yearly position. Can furnish gilt edge reference. Age 46. Can speak English and French fluently. Box 609, Canada Lumberman, Toronto, Ont. 15-18

WOULD LIKE TO HEAR from some saw mill owner who needs the service of a competent and reliable mill man who has had twelve years' experience in manufacturing in up-to-date mills; also would be willing to invest some capital with good people. Box 613, Canada Lumberman, Toronto, Ont. 16-20

Wanted–Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED MAN to take charge of Planing Mill. One who is capable of setting up machines, filing and grinding pattern knives. Address Drawer F., Sarnia, Ont. 13-t.f.

Business Chances

Sawmill For Sale

Complete Sawmill for sale, cheap and easy terms. Capacity 20,000 feet per day. Field Lumber Company, Limited, Field, Ont. 11-t.f.

Saw Mill For Sale

Complete Sawmill with timber rights and freehold lands for sale. excellent shipping facilities. Mill situated County of Shefford, with a visible supply of soft wood and hardwood timber in the neighborhood for an extended life. Address P. O. Box 222, Waterloo, Quebec. 16-t.f.

For Sale

Timber Limits and Sawmill, estimated fifteen million feet of hardwood and ten million feet soft woods. Sawmill capacity 25 M. feet, shingle mill 125 M. Docks, tugs, booms, logging outfit, houses, etc. Price $35,000

The Manitoulin Lumber Co., Ltd.,
11-22 Walkerville, Ont

Saw Mill For Sale

For quick sale, Saw-Mill complete, capacity 20,000 feet per day. Or will sell parts separately. Also two Pulpwood Loaders complete with Upright Boilers and Engines, capacity 500 cords each daily. All machinery in excellent condition. For further particulars apply The James Horrigan Company, Limited, Port Arthur, Ont. 15-18

Jobbers Wanted

We wish to let several contracts to take out logs on Berth No. 6, being broken front lying between the Magnetawan and French Rivers. This berth is all convenient to Canadian Northern Railway.

John Harrison & Sons Company, Limited,
Saw and Planing Mills,
9-t.f. Owen Sound, Ont.

For Sale

Sawmill, Planing Mill and Assets of the North Star Lumber Co., located at Elko and Hanbury, B.C., on the Crow's Nest Pass Railway. Capacity of mill, 50,000 ft. per ten hours. Practically new, having sawn less than twenty million feet. As the affairs of the above company are being wound up there is a real bargain in sight. Apply I. HANBURY, Vancouver, B. C., or R. W. RIDDELL, Coleman, Alberta. 15-15

Mill Plant and Limits For Sale

43 Miles Limits on 31 Mile Lake, Gatineau Valley, containing Basswood, Spruce, Fir, Pine, Cedar, Birch, Maple and Pulpwood.

New Waterous 8 ft. Improved Double Cut Band Mill complete. Steam Alligator, Boats, Sleighs, Wagons, Harness, etc. For further particulars apply to

Miscellaneous

BIG SNAP!
Fifty to Sixty Million Feet of Timber

White Pine, Yellow Pine, Fir, Larch, Spruce and Cedar. Large quantity Cedar Poles. Purchased seven years ago for $32,500. Now worth over $50,000. For quick sale will accept $25,000 cash. Write to Grand Forks Lumber Co., Grand Forks, B. C. 15-16

PROVINCE OF QUEBEC

Department of Lands and Forests

Quebec, 2nd June, 1917

Public notice is hereby given that, in conformity with the law, on the 21st of August next, at 11 o'clock a.m., at the office of the Minister of Lands & Forests Dept., Quebec, there will be offered permits to cut timber on lands belonging to the Crown in the Upper-Ottawa, Lower-Ottawa, St. Maurice, Lake St. John, East and West, Saguenay, Rimouski West and Bonaventure West agencies, comprising several large blocks in the Abitibi, Upper-Ottawa and head waters of the St. Maurice and Gatineau and on River Chamouchouan.

Permits will be adjudged to the highest bidder.

The price of adjudication is payable in 3 equal instalments.

The permit to cut will be subject to the ordinary conditions of the Law and Regulation and the grantees of any of the aforesaid territory must, within a delay of three years, manufacture, in the province of Quebec, with the timber cut in said territory, either pulp or paper in the proportion of ten tons per day, or sawn lumber in the proportion of ten thousand feet board measure per day, per hundred square miles.

Further information may be had by applying to the Department of Lands & Forests.

Elzear-Miville Dechene,
Deputy-Minister,
13-16 Dept. of Lands & Forests.

FOR SALE

Kootenay District, B. C.

STANDING TIMBER

Cedar	24,500,000 ft.
Spruce	17,500,000 ft.
White pine	17,000,000 ft.
B. C. fir	1,100,000 ft.

Lies on Jordan River. For quick sale will accept $20,000 for this block. Annual rental only $400. Government dues 50c per M. when timber is removed. Above quantities guaranteed.

We have other larger blocks of choice Western timber to offer.

Saw Teeth for Wide Band Saws

The outline of the saw tooth must conform to one or two rules if rapid and good work is to be obtained, together with a long life to the saw. Amongst the most important are:

1. Strength. The tooth must be capable of withstanding the heavy strain to which it is subjected, without breaking or cracking. With this end in view, the back of the tooth should be rounded, and the gullets made of circular form, the curve commencing well up the face of the tooth.

2. There must be ample, but not excessive, room in the gullet to carry away the sawdust.

3. No sharp corners should appear in the gullet, or anywhere except at the point. This is important, as sharp corners are a fruitful source of cracks.

4. The tooth should be of such a form that it will stand a considerable amount of hook. For this purpose the rounded back is an advantage.

The outlines above referred to conform with the above rules, and, generally speaking, are suitable for any class of timber if the hook and depth of gullet is varied to suit. The correct amount of hook which should be given to the tooth is a matter of great importance, and has received considerable attention of late.

It is well known that saws when ripping should act on the wood much in the same way as a joiner's hand-chisel does when used to pare off a shaving of wood.

To obtain this action considerable hook must be given to the front of the tooth, and it is evident if the tooth is to remain equally strong that a well-rounded back to the tooth permits of a greater hook than is possible with a straight back.

Of course, excessive hook can be given, with the result that the saw will take the feed too greedily and tend to travel forward on the saw-pulley. A more usual fault, however, is to give too little hook, with the result that the saw scrapes rather than cuts, and if the feed is at all pressed, tends to move backwards on the pulleys.

For soft woods the limit of hook which can be given with advantage is governed more by the resultant strength of the tooth than anything else, as before the hook is excessive for the work the teeth will become too weak, chatter, and shake in the cut.

Rather less hook and slightly shallowed teeth may be used for very difficult and hard woods, such as teak and quebracho, or if the wood is very knotty. The exact amount of hook given must be left to the judgment of the sawfitter, who must, from his own experience, determine the most suitable angle for the front of the tooth, under different circmstances.

Airplanes Require Much High-Grade Spruce

Congress has appropriated six hundred million dollars for the development of aviation and the training of a large force of American flyng men to win the war through permanent preponderance in the air. The plan calls for something like 30,000 airplanes during the next twelve months.

From a practical viewpoint, American lumbermen are interested in the big program, because it means many millions of feet of high-grade lumber for the construction of airplanes and other craft and much larger quantities for the construction of many aviation training camps throughout the country. The plan contemplates the conversion of some of the leading automobile plants, or parts of them, into airplane factories.

About 1,000 feet of lumber, largely high-grade spruce, is required for the wooden parts of the type of machine now constructed in this country. If a decision is reached to confine American construction for the present to training machines, thus enabling the British and French to turn out only battle planes, 30,000,000 feet of lumber would be required for the 30,000 machines planned for the next twelve months. If a quantity of much larger and more powerful machines are built, the consumption of lumber will be greater.

Small Amount of Potash from Sawmill Ashes

Dr. Curtis H. Twing, of the University of Washington, has been examining the ashes found in the incinerators of lumber mills in the Northwest, with a view to conserving the potash from the ashes. From a summary of the results of his researches it is learned that he found the flue dusts contained only about 7 per cent. The reason why this was so slight a proportion and the amount of ash was so small was that the type of incinerators in use calls for a strong draught, and this causes a good deal of the potash to go off in smoke. Dr. Twing did not see how the present incinerators could be improved upon so long as the present methods of lumbering obtain.

"Of course, the amount of wood that goes to waste in the lumber industry is a scandal and a shame to all of us, but until we have worked out ways of using the vast waste of sawdust, small branches and slats, there is no use in blaming the lumberman." And from the review in question, it hardly seems likely that the lumber manufacturers will furnish us with potash.

British Columbian Pine

The supply of this wood, owing principally to tonnage difficulties, is hardly sufficient to meet the demand. The shortage of labor in Canada has also a lot to do with the present scarcity of British Columbian pine, and the free-on-board value of the wood is advancing on this account. Prices, in fact, have been moving rapidly during the last few months, and they will probably continue to do so until the end of the war can be more clearly seen. America coming into the war will probably influence prices for all British Columbian productions, especially for the higher grades of spruce coming from that part of the world. Canada has, in more ways than one, been very useful to us during the war. She is not only providing the Mother Country with men of the best description, but also with the most essential wood used in the construction of another type of "fighting machine."—The Timber News.

Wood's Density Retards Decay

The Southern Pine Association has pubilshed conclusions reached by Dr. S. M. Zeller after two years of investigation regarding the decay of wood. It is claimed that wood with wide growth rings decays more slowly than that of narrow rings, if a large part of the ring consists of dense, dark wood. The fungus which is responsible for decay does not work energetically in the dense wood which represents the growth which the tree puts on late in the season. This fact should be borne in mind in selecting timber for foundations or to be used in any situation where decay is likely to be active. —Hardwood Record.

Review of Current Trade Conditions

Ontario

Everyone in the lumber trade today reports that business is quiet and some are feeling a bit depressed about it; but the fact of the matter is that these firms have very short memories and fail to recall that the months of July and August are quiet ones in the lumber trade every year. In fact, quietness is normal during the midsummer months. Moreover, the trade has really no reason to feel anything but satisfied with the present situation because in other years the midsummer quietness is often accompanied by sagging prices, whereas this year, prices are all strong, with an advancing tendency, which is easily understood by anyone who knows anything about the quantity of stock available at mill points and the condition of retail yard stocks throughout the province. Practically every line that one can mention is strong on account of scarcity and good demand. This applies to both domestic and imported lumber. There is nothing in the way of activity to report in connection with the building trade, although a moderate amount of business is taking place. The manufacturing industries using wood are all busy. The shell box business is more active than it was a few weeks ago, new contracts for considerable amounts having been let recently by the Imperial Munitions Board. These contracts were for the Bethlehem box and the price is $1.45. Previous contracts were at $1.35. The advance is on account of the increased cost of materials and labor, but is not sufficient to compensate the manufacturer for these. Higher prices for this box are expected on further contracts.

British Columbia stocks at Ontario points are in good demand and available stocks are low. Fir timbers were recently advanced $2 per thousand feet. Other prices are unchanged. The strike in British Columbia saw and shingle mills may have a further strengthening effect upon prices, but everything will depend upon how long it continues. Shingle stocks in Ontario are low and a long continued strike, interfering with deliveries from the coast, will reduce these stocks seriously. Hemlock continues strong. Trade with the United States is quiet, but steady.

The logging season in Northern Ontario is commencing and operators are going into the woods on quite an extensive scale. The general belief is that prices of lumber next year cannot fail to be higher than those of the present year and that manufacturers will be able to get back the increased cost of operating. Just at present there is a fair supply of labor for mills located in towns, but those that are in outlying districts are having trouble and have to advance wages continually. Even then they are unable to hold a sufficient crew all the time.

Exporters to Great Britain are not inclined to think that the recent removal of the embargo upon deck loads of timber will be of benefit to them. Such deck loads as it will be possible to ship will be furnished by exporters located at the ports of shipment. Moreover, a deck load is only permissible when the ordinary cargo in the vessel does not weigh her down below the Plimsoll line. As all cargoes today contain large quantities of munitions, the Plimsoll line is reached before there is any question of taking on a deck load, so it is scarcely expected that the permission to devote deck loads to timber will be of much value.

The lumber trade at Ottawa shows no important change, but all are expecting a good volume of business in the fall. This applies to both the retail and wholesale trade. Conditions today are considerably better than they were a year ago. Low grade stocks at Ottawa Valley mills are prety well disposed of, some mills being completely sold out. Dry stocks are becoming scarcer and some retailers have been taking green stock direct from the saw. Prices are all strong, and slight advances are reported in connection with all grades of pine strips, 1 in. x 7 in., also box boards, mill culls, strips and sidings. The demand from the United States is increasing and the prospects for further improvement are bright.

Eastern Canada

Although this is usually a quiet time in the trade at Montreal, wholesalers report that orders are fairly plentiful. Business with the United States, and from other outside points is compensating for the falling off in the building trade in Montreal. Local retailers, however, are purchasing lumber more freely. Building permits show an increase for the month and for the year to date. Hardwoods are quiet. The strike situation in B. C. is upsetting trade in B. C. products. Shingles are scarce and prices are changing daily. Shipments of stock to Great Britain are light, and consist almost entirely of spruce. There is a good demand for pulpwood, and prices are high. The sulphite and ground wood markets are quieter. This is their dull season.

At St. John, N.B., there have been no shipments of lumber during the past fortnight for trans-Atlantic business and there is scarcely any outlook for shipments in the near future. A few English buyers are reported to have commenced figuring upon the 1918 cut, but no sales are taking place as yet. Prices of deals must be higher in 1918 if they are to cover the greatly increased cost of production. Stumpage, labor, food and equipment have all advanced greatly in price, and pulpwood buyers are competing strongly for farmers' logs. The American market is uncertain and most prices have shown some slight falling off with the exception of boards. There is an excellent demand for boards and prices are higher, while stocks are very low. The quantity of deals or dimension produced at St. John this year will be small. Shingles are also easier in price for the American market, but for the local market they are strong. The local factory business at St. John is very active, but men for the benches are scarce. Local prices are strong.

The spruce market at Boston is fairly firm in all lines, but the demand from the retail yards has been rather light. The base quotation for frames shows no change. Random prices are reported to have eased off a little on account of Canadian spruce manufacturers seeking to dispose of surplus stocks on a quiet market. Boards are very strong, offerings being light and promptly taken up. At New York, spruce prices are still firm, but a little below the higher quotations which prevailed a month ago. Stocks are scarce and mills are still working on government schedules. The yard trade is rather quiet, because of the falling off in the building trade. The shingle business at boston has been quiet, but quotations are fairly well maintained. The uncertainty in regard to the supply of red cedar shingles caused by the labor situation on the Pacific Coast is helping sellers to maintain prices. The market for lath is quiet and somewhat easier than it was a short time ago.

Great Britain

The import season in Great Britain has now reached its height and practically all the large importing centres are extremely short of stocks. London, the largest of all the importing centres can only show a few thousand standards of sawn goods, and a few thousand of planed boards, floorings, matchings, etc. Roughly the stocks represent only about as much as one leading house would have contracted to bring forward between the commencement of the season and the middle of July. Similar conditions prevail in all the other large importing centres, and in the smaller ports, particularly, no timber at all has been received from abroad. The recent arrangements for importing stocks from Scandinavia are not producing extensive results. Many serious obstacles interfere with this trade and there is seldom any profit in it for the importer. A few more steamer cargoes of softwoods have recently arrived at London from the west coast of Norway and from Sweden. For 3 x 9 unsorted redwood and whitewood, the price asked has been £48 10s. per standard. For other lines the prices asked have been £47 for 3 x 7/8 and £43 for 2 x 4 up to 3 x 6. These figures are for the goods lying in the docks or at a wharf in London. Excessive as these prices may appear at first glance they are said to include very little for the importer. Norwegian flooriings are being quoted at 45s. to 46s. per square of 100 superficial feet, for 1 x 7 boards, in the docks. It is interesting to note that the selling of planed goods at London on the basis of 100 superficial feet has now become universal. Importers are speculating as to whether, at soft wood auctions in future, consignment parcels will also be sold on this basis.

No change of importance has taken place lately in the trade at Liverpool. The scarcity of spruce stocks is keenly felt, but there has been an increased enquiry for Scandinavian sawn goods in deals and battens. A full steamer cargo of this class of goods, including a small consignment of planed white boards, was discharged recently at Liverpool, and the bulk of it went direct into consumption. A sailer cargo of spruce deals and scantlings, containing approximately 480 standards reached Liverpool a short time ago, but was not expected to find its way into private hands. The government, it was thought, would take it over at an early date. Apropos of the reported relaxation in the embargo upon imports from Canada, it is interesting to note that Liverpool importers are not entertaining any great hopes of an ap-

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Cleveland-Sarnia Sawmills Co., Limited

SARNIA, ONTARIO

preciable volume of Canadian or United States stocks finding their way to that port under the new arrangement. They believe that the whole tonnage difficulty must be solved before the trade will reach any important size. Once this question has been settled and the importation of spruce renewed, it is counted upon to have an immediate effect upon the high prices prevailing for Scandinavian stocks.

A little more activity is reported in the timber trade at Manchester. Several sailers have reached the Mersey with spruce, pitch-pine and Scandinavian cargoes and according to latest reports these had not yet been acquired by the government buyer, though it was considered probable that in the end they would reach that quarter. Negotiations are on foot also for further imports in sailing vessels. Iicenses to import in this class of vessel, particularly if in neutral boats, are being granted a little more freely.

United States

The general business and agricultural situations in the United States are very encouraging. Crop prospects, as a whole, were never better and business in general is more brisk than usual at this time of year, chiefly on account of the enormous amount of buying that is being carried on by the Government. In connection with southern pine, the government requirements are still the most important market feature, and are keeping the mills very busy. Yard buying has also increased in some sections. Some retailers, however, are holding off in the expectation that when the government buying for cantonments is out of the way the mills will be more ready to take on their orders. It should be borne in mind, however, that the cantonment orders are only a portion of what the government will require, very large quantities being needed also for other purposes arising out of the war.

There is a normal midsummer demand for white pine, and stocks are small. It is probable that the supply of white pine will not be extensive during the balance of this season. Labor troubles are decreasing production and embargoes are keeping shipments from reaching their markets, so that prices continue firm in all grades. The best demand is for high grade stock suitable for patterns and for the better grades of shop. There are indications of a revival in the retail buying of white pine, particularly in those sections where the crops are already pretty well assured. The labor situation is the most important element in connection with the Inland Empire trade. Although conditions have quieted down to some extent recently, a number of mills are not running, and shipments have been curtailed. There is a good demand for western pine and it is increasing steadily. Stocks that are suitable for box shooks, and also the upper grades are in strong demand. All prices are firm.

The trade in white pine at Buffalo is not quite so active as it was a few weeks ago, but a fair amount of pattern lumber and low grades is being used. The retail trade is not so good as it was last year, and building is very quiet. Prices are firm and stocks are moderate. Heavy receipts of white pine are reported at North Tonawanda recently. In most cases the lumber is being moved out rapidly to consumers. Prices are strong, particularly for low grade stock. Buffalo reports a fair demand for hemlock, but the volume of sales is not as large as a year ago. The crop outlook is excellent and improved buying of hemlock is expected before long. Prices are firm. North Tonawanda dealers report plenty of orders for hemlock to keep them busy. Much of this trade is coming from manufacturers, who are using hemlock for a great variety of purposes. The general opinion is that at the close of navigation there will not be much stock on hand in the yards.

The hardwood trade at Chicago is characterized chiefly by a heavy demand for war purposes, such as production of motor trucks, wagons and other vehicles. Otherwise, trade is seasonably light. All prices are firm. Hardwood manufacturers are counting upon a good demand this fall and a continued high range of prices. Stocks are below normal and labor is gradually becoming more scarce both for the woods and the mills. At Buffalo, the hardwood trade is not quite so active, but prices are firm.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Trade Expecting Good Fall Business

Ottawa, August 7.—(Special to the Canada Lumberman.)—No great change has been experienced in the Ottawa lumber market during the past two weeks, but all indications point toward a good fall business for both the retail and wholesale trades. In comparison with the corresponding period last year the lumbermen agree that conditions are somewhat better, and that the market has shown a considerable improvement. In this group of lumbermen, however, must not be included John R. Booth, whose large export lumber business is practically at a standstill because of the enforcement of the British embargo. The Canada Lumberman is informed that John R. Booth may shut down his lumber mill at Ottawa. At present it is only working in the daytime. Before the war it operated with heavy night shifts. Piling ground is another matter of concern with the Booth plant. During the week of July 28 to August 4, Mr. J. R. Booth renewed his fight in the City Council for continuation of his use of the northern end of Bronson Avenue as a piling ground. This ground gives him shipping facilities on the Ottawa River. The city, on the petition of property-holders, intends to open up a street to the river.

A large percentage of this season's mill cut of the lower grades of lumber has already been disposed of. The Shepard & Morse mill is completely sold out of these grades, and its whole season's cut of all kinds of lumber is largely bought up or contracted for. Stocks of dry lumber are getting smaller, but there has been no evident scarcity as yet. While some of the green cut came on to the retail market nearly a month ago, it was because the retailers took it straight from the saws. The green lumber proper, the manufacturers say, is not yet ready for shipping, and will not be for another three or four weeks. Lumber manufacturers, it appears, are seeking to secure all the wood they can get, and saw it, pile it, and dry it. One of the reasons is the possibility of a great shortage of labor for next years' operations. Mill owners are weighing the possibilities of a labor shortage through the enforcement of the Canadian Compulsory Service Act, and apparently think it wise to obtain as much stock as possible this year, as next year they may not be in such a favorable position to do so.

There have been no decrease in prices for the last month, as stocks have not been large, nor have operating costs declined. All grades of pine strips from 1 in. to 7 in. have advanced in price, along with box boards, mill culls, strips, and sidings, 1 in. x 4 in. and up.

An increased American demand is asserting itself, and many orders and enquiries are being received. Practically all the export business that is being done by the manufacturers at present is to the United States, and for the first two weeks of August, as compared with the similar period of July, business has picked up considerably, and prospects for a continued increase in American orders appear bright. It is difficult to get the manufacturers to state how much they are shipping weekly to the United States. Offhand they do not care to give even approximate figures, but many cars of lumber are going from Ottawa mills to destinations in the United States every week. W. C. Edwards & Co., Ltd., are among the heaviest shippers to the United States, and at present a large percentage of their business is constituted by American orders. The company report that their mill is having a good season. Recently female labor was introduced, between fifty and seventy-five girls being employed for mill work. According to Mr. S. C. Thompson, manager of the company, the new class of labor has been satisfactory so far. "They are always on the job," is the manager's comment regarding the girls and their punctualtiy in getting down to work on time.

There has been no outward sign of uneasiness with the plants manufacturing shell boxes, but it is reported that some apprehension is felt as to how they will be kept busy when contracts for shell boxes cease. Announcement was made some time ago that the imperial authorities had decided to make no further contracts for shells in Canada. This would end the demand for shell boxes, and a great quantity of lumber of the grades required would become available to the market. One usually well posted member of the lumber trade states that no more contracts for 9.2 shell boxes will be given. The latest orders secured by a local firm were for Bethlehem boxes and the smaller size 6.2 box.

St. John Export Shipments at a Standstill

St. John, N.B., Aug. 6; (Special to the Canada Lumberman):—The past two weeks have been the most stagnant at this port, in regard to shipping of lumber, of any time during the past two years. Practically no lumber has been loaded on ship at St. John for across the waters, and at the present moment there is no prospect of shipments. No sales have taken place for 1918 business and there is no talk of any as yet, although it is said that the English buyers are

PURER MILK

for Your Men at Less Cost to You

Liquid milk has been replaced in cooking by the modern milk powder, KLIM.

KLIM is made from the purest and freshest milk received daily from Ontario farms at our plants in Burford, Hickson, Brownsville and Belmont. The milk is separated, pasteurized and reduced to powder form by the most sanitary mechanical process obtainable. KLIM is used in all cooking, and is more

CONVENIENT,
TIME-SAVING,
ECONOMICAL

than liquid milk.

KLIM costs less than any other form of milk because it will remain sweet and pure until the last grain is used. It does not require ice in Summer nor will it freeze in Winter.

You save 75 per cent. in freight charges, as you pay freight on nothing but milk solids which contain all the food value in the milk.

If you have not tried KLIM, order a sample 10 lb. tin from your supply house to-day.

Original "Dunbar" Machines

We are the original and the only makers of "Dunbar" Shingle Machines, Lath Machines, Clapboard Machines, Steam and Gasoline Logging Engines. Each is the best for its particular work. Are you using the best?

Lath Machine

From our many years of experience we evolved this "Dunbar" Original Lath Machine. Every improvement that could be suggested, every time-tested idea for the betterment of product and for greater speed, has been incorporated in this machine. We believe it has no equal, and there are a great number of mill men throughout Canada who share this belief with us. Carefully constructed of high grade materials and designed to work steadily under the hardest conditions.

Steam and Gasoline Logging Engines

Conditions in Canada necessitate an engine that will stand any amount of strain and hard work in the lumber industry. With this idea in mind we have brought out the "Dunbar" engines perhaps a little stronger than is really needed. They do their work easily and willingly, and stand a great amount of hard usage. Built entirely in Canada for the Canadian lumber trade.

Clapboard Machine

You will need no excuse for the quality of your product if you use the original "Dunbar" Clapboard Machine. Expert in every detail. This machine will give you the very best service under most trying conditions. It will turn out work without delays. It will need practically no repairs and will increase your output. We cannot recommend it too highly because it is giving this very service to lumbermen in all parts of this country.

Send for catalogues of any or all of these machines.

Dunbar Engine & Foundry Co.

WOODSTOCK, N.B.

beginning to do some figuring. The price for deals must certainly be higher in 1918 than during the past year. Positively everything that enters into the getting of the log is increasing in price month by month. First of all, the price of stumpage in New Brunswick has doubled, including the government dues. All farmers' lots are being taken at fabulous prices by the pulp buyers, who are now flocking this way, and unheard of offers are being made for pulp lands of all kinds. Food and labor have also doubled in price. Therefore, the buyer must pay a larger price for deals or the operator must remain idle all through the coming winter, as he will not leave himself open to such a risk as would mean ruin, to undertake operation unless he knows his price beforehand. A greater scarcity of man power is also being felt than ever before. Men who always have gone to the woods in past years now get double wages in the cities and refuse to go.

In the American market a feeling of uncertainty is beginning to show itself. Prices of all stocks of lumber, excepting boards, have receded, in some cases $3 per M. Boards are in great demand and prices are higher than ever before, with practically no stocks available. The mills at St. John are, in some cases, nearly done sawing and all are half through. So it can be seen that so far as St. John is concerned the quantity of deals or dimension will be so small that it will have practically no effect on the market abroad or at home. Shingles are following along in a downward trend, as far as the American market is concerned, but locally they are very strong

Locally the factory business during the past season has been as good as it has since the war broke out. During June and July the factories all over the city had more business than they were able to care for. Men to work at the benches are very scarce, and the average turn-out is very poor. Stocks of low grade lumber are very scarce and prices locally are very high.

The Shipping Situation at Parrsboro, N. S.

Parrsboro, N.S., Aug. 10.—(Special to the Canada Lumberman.)—Only one small cargo of deals (less than half a million superficial feet) has been shipped from this vicinity this season for a port in the United Kingdom, and that cargo failed to reach its destination. Late last fall the Parrsboro tern schooner Coral Leaf loaded deals here for a British port. While waiting for a chance down the bay she dragged her anchors in a heavy gale, and was driven ashore. As she lost part of her keel and sustained other damage, she was towed into port, where the cargo was discharged and repairs made. The parties who bought the cargo insisted that it be delivered, so the deals were reloaded and the vessel sailed. When off the coast of Ireland she was shelled and set on fire by a German U-boat. The crew escaped in the boats, and the vessel was subsequently towed into Castletown by a patrol boat, but presumably neither vessel nor cargo was of much value. The master arrived home a fortnight ago.

Two importations of spars from Seattle, Wash., were delivered here last month for the three-masted schooners building on this shore. Each lot consisted of ten spars and occupied three flat cars. The freight bill in each case was about eleven hundred dollars, and there was a war-tax of between eighty and ninety dollars on each importation. The spars were of Douglas fir, sawed eight sides, and were about 90 feet long.

A fine three-masted schooner of 435 tons register was launched at Spencer's Island on August 4. This is the first to be ready for launching of the fleet of tern schooners building along this shore and to be registered at this port. She was built for C. T. White & Son, of Apple River, one of the leading lumber firms of the county. The firm has quite a fleet of vessels, and this one was intended for their own use, but they have sold her to Australian parties, who have come far afield in their search for tonnage. The new vessel will take a cargo of gypsum from Windsor to New York, where she will be delivered to her new owners. Another vessel of about the same tonnage will be launched for Messrs. White this week.

The deal trade with the United States is developing slowly—very slowly. Three tern schooners have loaded deals here for United States ports this season, the last of the three sailing to-day. One of them cleared for Philadelphia, the other for New York, and more may follow before the season is over. Whether the trade will ever develop into anything worth while remains for the future to disclose, but a beginning has been made, and a profitable trade is among the possibilities.

Montreal Experiencing Active Outside Trade

Montreal, August 7.—(Special to the Canada Lumberman.)—Generally speaking, trade is satisfactory. This is usually a very quiet period, but wholesalers state that orders are coming in well, and that

No Sawmill however small, is complete without a TOWER EDGER

It increases the output of a mill one-third.

It relieves the main saw of a great deal of work, leaving it free to perform its proper function of cutting up logs; and, when the log is disposed of, the edging is also done.

It makes more merchantable lumber per log.

It wastes the minimum quantity of material, saving considerable No. 1 lumber that is lost when the edging is done with the main saw.

It raises the grade of the lumber, removing hearts, shakes, and knots, making firsts and seconds out of commons, and so cutting up every board as to make it as valuable as possible. For example, a board that will grade as No. 2 may be ripped so that one piece goes into the No. 1's and the other into the No. 2's.

It gives the boards straight and parallel edges.

It makes them of standard or any desired special widths, and automatically cuts them scant, exact, or plump, as desired.

It is also used extensively for ripping.

Install a KRAFT SODA MILL

CANADA has another big war opportunity: Great Britain needs more wood pulp. Install a small Soda Pulp Plant and Supply this need by converting your Slats, Tops, Bottoms and waste wood around the Saw Mill into pulp. We can dispose of any amount. Previous sources of supply in Sweden, etc., have recently been withdrawn and Canada now has a free field in Great Britain to market unlimited quantities of wood pulp. We can arrange contracts for long periods.

The cost of installing plant is small and you make a sure profit from waste material.

202 Board of Trade Building

MONTREAL

while there is not a great deal going on locally in the way of construction, this is made up for by business from the United States and from other outside points. Retailers are also purchasing more freely. In the Province of Quebec a certain amount of uneasiness is caused by the conscription bill, buyers holding their hands until they can gauge the effect of the measure more accurately.

The building permits for July are better. The total was $877,195. For the seven months the amount was $3,311,539, an increase of $331,325.

The hardwood section of the trade is quiet. There is still a good demand for pulpwood, with prices very high. The outlook is towards stiffer values, on account of the shortage in labor, which will make its effects more acutely felt during next winter. Farmers, who have received unprecedented prices for their wood, are said to be very independent in their attitude towards buyers, and are inclined to limit production.

Some fair orders for British Columbia timber for shipbuilding purposes have been received. A very large business has been done for this branch, although it is stated that the bulk of the orders have now been placed for the vessels given out by the Imperial Munitions Board to shipbuilders in the East.

A letter received by a Montreal wholesaler from a prominent manufacturer in the West gives a gloomy picture of the shingle situation on the coast. Owing to the activities of the I.W.W., 85 per cent. of the shingle mills in British Columbia are closed, and there is fear of the strike spreading to the logging camps. The British Columbia shingle market is very uncertain, and prices are changing daily.

Only a small quantity of lumber is being shipped to the United Kingdom, this consisting practically all of spruce. It is reported that Quebec firms are sending a considerable amount of square timber for government account.

The sulphite and ground wood markets are much quieter. This is the dull season, and prices have reacted slightly under the slower demand.

New York Market Quiet

Simpson, Clapp & Co., New York, report under recent date as follows: There is very little to report, except a very dull market. We are in the midst of the usual midsummer slump, and there have been no regular enquiries put out for some time. Recent arrivals of Maritime Province cargoes have sold at prices considerably under former levels, and laths are hard to sell. Government requirements have been almost entirely provided for, both for cantonment and shipbuilding, and, with the gradual readjustment of business, we hope to see late in the fall a more normal outlook, based on actual trade enquiry and requirements. We hope, also, to see the freight market fall to a level which will make vessel shipment an industrial possibility rather than an extravagance encouraged by shortsighted competitive bidding.

Spruce Deal Situation at Liverpool

The Timber Trades Journal, of London, Eng. discussing the spruce deal market at Liverpool, Eng., in a recent issue, says:—There is still a state of inaction in the c.i.f. market, although those interested are now awaiting the result of the consideration of the powers that be regarding the letter forwarded by the Liverpool Timber Trades Association. The time is passing, and if anything at all is to be done this season, it must be done without any further delay. There is no disputing the fact that the goods are available for shipment, and although the freight difficulty is a serious one, no doubt it can be overcome. The spot market is in a very perilous state, and consumers are almost at their wits' end as to where to obtain their requirements. Many have been advised to obtain them from native timber, but their efforts in this direction have met with very little success. The plain, bald facts are that at the end of the present month an absolute famine in softwoods will be more than demonstrated even to the most casual observer, and we cannot understand why things have been allowed to drift on in the way they have done. Practically the whole of the consumption is required in connection with the work for carrying on the war to a successful termination, and the absence of the material is in itself a serious menace. Cases could be cited where contractors having direct government contracts are unable to find the wood for the work on the market, and are unable to obtain release from requisitioned stocks. It must be presumed that the contracts have been made for the purpose of carrying on the war, and therefore the absurdity of the position is the more striking. At this time of the year most importers have made their contracts for the bulk of their imports, and such would have been the case this year except for the unnecessary import restrictions imposed.

The opinion is generally held that had the restrictions enforced not been so drastic, the Scandinavian shippers would not have been in the happy position they are to-day.

Lessening the Cost of Lumber

The cost of the rough lumber in the yard, and of the amount of lumber necessary to turn out a given piece of work, may be two very different things. It is right here that the purchasing agent may blunder grievously. The lumberman comes along and tells Mr. Purchasing agent that he has a lot of second-quality quarter-sawed oak which he can sell at $4 a thousand less than the stock that the purchasing agent is now buying. "Of course, there are some few knots that you will have to cut out, but these will not amount to as much as the saving." Our friend jumps at the chance; thinks that he is making a saving of at least $2 or $3 a thousand after allowing for the knots.

There is only one way to know what the actual saving is, and that is to keep an individual lumber account for each order which goes through. When an order is received, the cost clerk estimates the amount of material required, sends out the cutting bill and an order for the required stock. Now, in the ordinary shop and at the cut-off saw there are several piles of lumber. The cut-off man simply fills the order from this without paying any attention to the number of boards he cuts up, hence there is no record of the number of feet of purchased lumber.

In some factories the cut-off bill, in place of going to the cut-off saw first, goes to a man in charge of the lumber. He measures up the required amount of lumber, puts it on a truck with the cut-off bill and sends it to the saw. He knows that there should be at least a half-board over or some other indefinte amount. Now, if no great loss results from discarding knots and other irregular parts, everything will come out all right, but if the man at the cut-off saw has to discard a large number of pieces he will come out short.

In many cases he will simply slip over to the pile of left-overs from previous jobs and pick out enough scrap to finish the order. Or he will slip out into the yard and say, "Bill, you will have to let me have another board on that last order; you were a little short." He will take the board from the pile, carry it in and cut it up without making any record of it. In either event the purchasing department has no knowledge of the actual amount of lumber entering into a given piece of the manufactured product.

When comparing different grades of lumber it is necessary to measure the rough stock accurately and to determine just what is the average loss. I know of certain firms making a careful study of this subject. They have found "soft spots" in the lumber market; these soft spots may be located in positions where they would least be expected. In one case, where the stock had to be cut into fairly long lengths, the soft spot was found in the highest-priced lumber, which was actually from $4 to $6 a thousand cheaper than the lower grades when the number of dollars' worth of lumber necessary to turn out the finished product was accurately determined.

As a general rule, the longer the pieces of stock to be cut the more necessary the use of high-grade and clear stock. For short work the lower grades frequently work in to advantage, and good saving may sometimes be made by their use. The average woodworking plant is so busy turning out product that it has no time for detailed study, taking into account the matter of first cost of lumber and its effect upon the amount of time that must be spent upon a given job. When lower grades of lumber are used and a considerable amount of material discarded, there should be considered the extra time necessary in handling the larger amount of lumber in the yard, through the dry kiln, over the cut-off saw, and of hauling away the discarded blocks.

A careful inquiry of this kind will frequently make a saving that will show a distinct profit on the finished piece. Of course, this applies more particularly to outside or finish lumber. Core stock may vary through a wide range, for certain classes of material anything that is sound can be used in the cores.—The Woodworker, Indianapolis.

In very high speed band saws it is apt to happen that vibration is increased with speed, distortion tension is increased by vibration, and fracture of saw by both. Besides high speed and the attendant vibration being a cause of fracture, there is an added cause, the constant impact of the saw against the wheel, the constant bending and straightening, the constant tensional and torsional strain on the saw, all working in conjunction with the defects that may exist in the blade itself, either by fitting or innate defects,

---

If the tension approaches too near the edge of teeth of band saws, fracture may result. If a saw has fast and loose spots in it, the tendency to crack is largely increased, the fast spot cracking from undue tensile strain, and the loose spot from constant buckling of surplus metal.

EDGINGS

Ontario

Sarvice Limited, lumber dealers, Chatham, Ont., have obtained a charter.

The basket and berry box factory belonging to Geo. Rivers, Strathroy, Ont., was recently destroyed by fire. The loss amounted to $10,000. The owner will rebuild immediately and will be in the market for machinery.

Berth 201 on the north shore of Lake Huron has been sold by the Ontario Government to the Bishop Lumber Company, Nesterville, for 50c per thousand feet for pine and spruce, in addition to dues of $2 per thousand feet, and 15c per cord for the spruce pulpwood, in addition to 40c per cord dues.

John A. McIntyre, Rodney, Ont., is contemplating the erection of a planing mill, to replace the one recently destroyed by fire. Besides the planing mill a storehouse and office were destroyed, incurring a loss of $10,000. The owner will prepare his own plans. New machinery will be required.

A new lumber company has been formed in Pembroke, Ont., and has started operations. It will engage chiefly in the pulp wood business, and a gang of men is busy taking out spruce from the fifty miles of limits which have been acquired. The members of the new firm are W. L. Hunter, J. C. Hunter and W. B. Wilson.

A new shipbuilding company has been incorporated under the name of the British American Shipbuilding Company, Limited, with head office at Toronto, Ont., and capital stock of $1,000,000. Among those interested are A. A. Kinghorn, Excelsior Life Bldg., Toronto, Ont., and F. H. Keefer, Torold, Ont. The company will carry on general shipbuilding and contracting work.

A new shipbuilding company has been incorporated under the name of the Toronto Shipbuilding Company, Limited, with head office at Toronto, Ont., and capital stock of $100,000. C. S. Boone and J. J. Manley, 17 Adelaide Street East, are interested. The company will build and equip all styles of vessels. The yards, etc., will be located in Ashbridges Bay district and they now have a contract for two vessels.

A recent timber sale held by the Department of Lands and Forests of Ontario resulted in Township 1 A. Mississaga Forest Reserve being sold to McFadden & Malloy, Spragge, Ont., at the following rates: white pine $3 per thousand feet plus $2 dues, red pine $2 per thousand feet plus $2 dues, jack-pine and spruce $1 per thousand feet plus $2 dues, spruce pulpwood 25c per cord plus 40c dues, other pulpwood 10c per cord plus 20c dues, railway ties 5c plus 5c dues, cedar posts 2c plus 1c dues, cedar poles under 30 feet, 30c plus 15c dues; 30 feet to 40 feet, 30c plus 25c dues; 40 feet to 50 feet, 50c plus 50c dues; 50 feet and over, 75c plus $1 dues.

The Department of Lands and Forests of the Province of Ontario made a sale of the timber in the township of Sweeney on August 1st. The timber was sold in two sections. The west half of the township went to the Electric Planing Mills, Welland, in which Mr. Samuel Lambert is interested, the price paid being $6.55 per thousand feet, plus dues of $2 per thousand feet for the white pine, and $5.55 per thousand feet, plus $2 per thousand feet dues for the red pine. The east half of the township was sold to Leforest and Clemow, Sudbury, Ont., the price being $11.15 per thousand feet, plus $2 per thousand feet dues for the white pine, and $10.15 per thousand feet, plus $2 per thousand feet dues for the red pine.

The timber deal recently reported to have taken place between the Colonial Lumber Company as purchaser, and the Canadian Timber Company as seller, had not, up to the end of the first week of August, been formally and finally closed. There is little doubt that the deal, which includes the purchase of 330 square miles of woodland, known as the Magnissippi limits near Two Rivers, will be finally closed shortly. As matters stood during the first week of August the deal was practically through, but certain documents were not yet signed. The impression conveyed that the Fraser, Bryson Lumber Company has sold the limits was entirely incorrect, as this company deals in wholesale lumber, and has no limits. The Colonial Lumber Company agreed to purchase the limits from the Canadian Timber Company, of which Mr. W. H. A. Fraser is president. Further information as to the sale price and other details of the deal are not yet available. It is considered likely that the deal will be completed inside of the next month.

Eastern Canada

The Harvard Lumber Company, Montreal, P.Q., have been registered. Wm. R. Bruce is interested.

Fire recently destroyed the sawmill belonging to Gendron Plante, St. Victor de Tring, P.Q. There was no insurance.

Demers & Dodier, lumbermen, Thetford Mines, P.Q., have been registered. Jos. Demers and A. Dodier are interested.

The William Lyall Company, Montreal, P.Q., are entering the shipbuilding business. The Canada Gazette gives notice of the incorporation of

the William Lyall Shipbuilding Company, Limited, with capital of $1,000,000, and head office at Montreal.

The Belgo Canadian Pulp & Paper Company, River Side, Shawinigan Falls, P.Q., are contemplating the erection of a pulp and paper mill at Cap de la Madeline, P.Q. The manager is H. Biermans, care of the company, and he has an option on the property of the Burrill Lumber Company, near Highway Bridge.

The Log Supply Company, Limited, has been incorporated with head office at Montreal, P.Q., and capital stock of $50,000, to carry on business as lumbermen and timber merchants, and to manufacture and deal in logs, timber, lumber, etc. Among those interested are A. Falconer, Westmount, P.Q., C. G. Ogden, J. L. Reay, H. A. Ellis and J. L'Heureux, all of Montreal.

A severe flood in the Chaudiere River Valley, P.Q., recently caused considerable loss to timber owners. Booms were destroyed at the mills of the Brown Corporation, John Breakey, H. Atkinson, and B. C. Howard. A vast quantity of lumber and pulpwood logs was carried down the river and out into the St. Lawrence. A despatch to the Quebec Telegraph states that the loss sustained is estimated by one who is closely in touch with the situation at about $4,000,000, which is made up as follows:—Brown Corporation, $750,000; Breakey Company, $1,500,000; loss to farmers, $500,000; loss to merchants, $500,000. Highway bridges, public roads ruined and miscellaneous losses, $500,000; railway company's loss, $250,000.

Western Canada

Fire recently destroyed the sawmill belonging to Christenson Bros., Boundary Falls, B.C.

The mill of the Deer Lake Lumber Company, Vancouver, B.C., was receently destroyed by fire.

A. G. Lambert & Company, Limited, sawmill operators, Nelson, B. C., recently suffered loss by fire.

The lumber mill belonging to A. J. Lambert Company, Nelson, B.C., was recently destroyed by fire.

Fire recently destroyed a lumber camp and equipment belonging to the Elk Lumber Company, Fernie, B.C.

The lumber mill belonging to the Kootenay Shingle Company, Salmo, B.C., was recently destroyed by fire.

The Rainy River Pulp Company, which operates the mill at Port Mellon, Howe Sound, will about double the output shortly and will manufacture kraft paper.

The Swift Creek Lumber Company, Limited, has been incorporated with head office at Fernie, B.C., and capital stock of $20,000, to carry on business as loggers, lumbermen, sawmill proprietors, etc.

The Vernon Lumber Company, Limited, has been incorporated with head office at Vernon, B.C., and capital stock of $10,000, to carry on business as timber and lumber merchants, sawmill and shingle mill proprietors, timber and lumber exporters, etc.

The Vancouver Ship Yards & Engine Works, Limited, are contemplating the erection of ship yards at Vancouver, B.C. Work will likely be let by contract and tenders will be called shortly. S. Matheson, 517 Rogers Bldg., Vancouver, B.C., is the manager.

Mark DeCew and B. Lequime, veteran lumbermen, of Grand Forks, B.C., have purchased the machinery of the Western Pine Lumber Company, and will erect a new plant at Lynch Creek on the north fork of the Kettle River. The name of the new concern will be the Grand Forks Lumber Company.

The Alberni-Pacific Lumber Company, which is operating the plant of the Canadian Pacific Lumber Company at Port Alberni, is putting in a considerable quantity of new machinery. In addition to a heavy domestic trade, the firm is getting into the export business and will ship to Australia this year.

The Lumber Products Company has taken over the plant of the Iowa Lumber Company at New Westminster, and will operate a sawmill, planing mill, box factory and toy factory. The box factory will be the principal part of the new business. The toy factory will be an extension of that now operated at North Vancouver.

Sealed tenders are being received by the Minister of Lands for British Columbia, until the 29th day of September, 1917, for the purchase of License X1035, to cut 11,000,000 feet of ceedar and fir on an area adjoining Lot 913, New Westminster District, situated on Haslam Lake. Three years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 4th day of September, 1917, for the purchase of License X1041, to cut 12,000,000 feet of Douglas fir, spruce and balsam on lot 2677, Cariboo District, situated immediately south of Hansard Lake. Three years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia, until the 31st day of August, 1917, for the purchase of License X829, to cut 3,250,000 feet of fir, cedar, hemlock and balsam on an area adjoining S. T. L. 43839, situated on Estero Basin, Range 1, Coast District. Two years will be allowed for the removal of the timber.

Sealed tenders are being received by the Minister of Lands for British Columbia until the 6th day of September, 1917, for the purchase of License X862, to cut 1,300,000 feet of cedar, spruce, fir and hemlock on lot 3300, Kamloops district, situated south of Home Creek on the North Thompson River. Two years will be allowed for the removal of the timber.

Utilization of Waste Wood

We have a wide experience in the design and construction of complete plants for the economical commercial using of waste woods

Plants Proved in Operation:

DISTILLATION PLANTS: Slabs, Limbs, etc.
ALCOHOL PLANTS: Sawdust, Shavings, etc.
PULP MILL EQUIPMENT: Soda, etc.
OXALIC ACID PLANTS: Sawdust, etc.
WASTE SULPHITE LIQUOR FERMENTING PLANTS: Alcohol

"The Plants With Reputations"

Send us your enquiries, we will give you our best services by return

BLAIR, CAMPBELL & McLEAN LIMITED

GLASGOW, SCOTLAND

Est. 1838. Cables: "Blazon, Glasgow." Code: ABC—5th

Safety-First Light Speed Car

We have placed this car on the market because of an urgent demand for a car light enough for one man to handle easily, and yet strong enough to carry two to four passengers with luggage or material. The frame is made of 2x1x3/16 inch channel steel. Length of car platform 5 ft. 1 in. Width of car platform 4 ft. 3 in. Wheels are 16 in. pressed steel, brakes on all four wheels. Weighs approximately 450 lbs. One man can easily put it on or off the track anywhere. Engine is a 2½ H. P., reversible and free running. This car can conveniently be used by time-keepers, logging foremen, superintendents; in fire patrol service, etc.

Price $125.00 complete, ready for service.

We also make larger cars equipped with engines rating from 4 to 12 H. P. and ranging in price from $160.00 to $500.00.

NORTHWESTERN MOTOR CO. (3L)

1500 Spring Street Eau Claire, Wisconsin

ONTARIO

Canada's Banner Province

Ontario's timber production last year valued at $26,774,937 or 40% of Canada's total output.

Pine production, 905,442,000 ft. B.M.
Pulpwood, 246,282 cords.
Railway Ties, 5,704,459.

Ontario's woodworking industries, using 34 different kinds of wood, provide a ready market for the lumberman. Eighty-two per cent. of lumber used in Ontario's industries purchased within the Province.

Ontario's vast resources offer unsurpassed opportunities to the lumberman.
For maps and full information regarding Ontario, apply to

HON. G. HOWARD FERGUSON,
Minister of Lands, Forests and Mines.

The Corbet Automatic Steam Towing Machines

MADE IN CANADA

The Corbet Automatic Steam Towing Machines are installed on a large number of the best Tugs on the Atlantic and Pacific Coasts and on the Great Lakes and have proved so satisfactory that not one of our customers would be without them under any circumstances as they have proved the best investment the owner ever made in equipping his tug. Why continue to be without our Towing Machine which will increase the efficiency and earning power of your tug?

The Corbet Foundry & Machine Co., Ltd.

OWEN SOUND, ONTARIO, CANADA

The Three Goodhue Belts

"EXTRA" "STANDARD" "ACME WATERPROOF"

These three brands are made for three different services and each brand is the best quality made from selected hides with the stretch taken out.

"Goodhue Belts" stretch less than any other belt by 15 to 25 per cent. This quality effects a great saving because it is unnecessary to be continually shortening the belt to keep it taut.

"Acme Waterproof" brand is made for the wet places in a mill and will give a remarkable service under the most trying conditions.

When you buy a belt—buy a Goodhue. Prices and particulars on request.

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING
— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1″ diameter and under, and the largest, 4″ diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

Don't Blame the

FIRE BRICK

if it fails to give satisfaction. More likely than not you have been using the wrong kind for your particular purpose. A firebrick intended for use in a small hand-fired boiler may not give the same result if used under high pressure boiler with mechanical stoker.

So when sending us your enquiries be sure to specify for what purpose these brick are to be used.

You are sure then of a high quality brick, that is absolutely the best for your purpose.

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

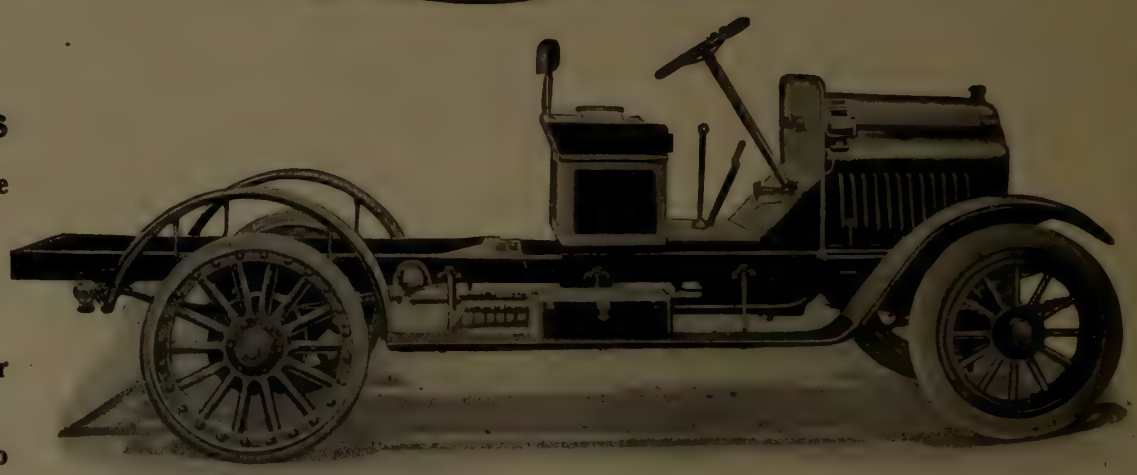
The "Little Giant" Truck

Special Features

Timken Worm Drive
Continental Motor
Schebler Carburetor
Ross Irreversible Steering Gear
Eisemann High Tension Magneto



Standard Models

"H 4"—1½ tons Chain Drive
"15"—1 ton Worm Drive
"16"—2 tons Worm Drive
"17"—3½ tons Worm Drive
"18"—5 tons Worm or Chain Drive to order

Model 15—1 Ton

THE LITTLE GIANT MOTOR TRUCK enables the retail lumber dealer to give his customers the very best of service, which is the big outstanding argument that interests the busy contractor. Other things being equal, the lumber dealer who can give the best service gets the most business.

The DUNTLEY Hydro-Pneumatic Gas Generator

THE DUNTLEY Hydro-Pneumatic Gas Generator is an exclusive feature of Little Giant Motor Trucks. With this device the Little Giant Truck may be operated on a mixture of one-half kerosene and one-half gasoline, at a saving in fuel cost of over 50 per cent., with a total absence of carbon, smoke or odor.

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

MONTREAL LOCOMOTIVE WORKS, LIMITED,

DOMINION EXPRESS BUILDING, MONTREAL, CANADA.

NO. 40 HEAVY DUTY STEEL SAW CARRIAGE

Long's "Quality" Carriages were the first saw mill machines built by the Company. They were the machines that earned the reputation for dependability in service, that has placed "Long" Machinery in its present enviable position, at the head of its class. There is a "Long" carriage, in a weight, and at a price, to suit every purchaser. Catalogue on application.

The carriage illustrated is our heavy duty 3 block No. 40, the knees of which recede 40" from saw line. The carriage can be furnished in any number of head blocks or axles.

This mark on your saw mill machinery is an indication that your lumber manufacturing equipment is the best and most economical money can buy.

The E. Long Mfg. Co. Ltd., Orillia

An Edger for 6" Cants

You can put a 6-in. cant through this edger and know that it will come through edged to a hair. Edger carries 22-in. saws, 6-in. saw collars, leaving 7-in. clear saw blade, more than enough margin for 6-in. stock

Mandrel is 3⅞-in. in diameter, the three bearings that support it are each almost 10-in. long—the rest of the machine is built in proportion. That's why Waterous New Champion Edgers can be crowded to the limit and will turn out full capacity, day after day, without straining.

Notice the feed rolls, two before and two behind the saws. They are machine fluted to give a firm, secure grip on the timber that holds it fast, but will not mar it in any way.

We build up-to-date Machinery for Sawmills of every capacity—circular or band

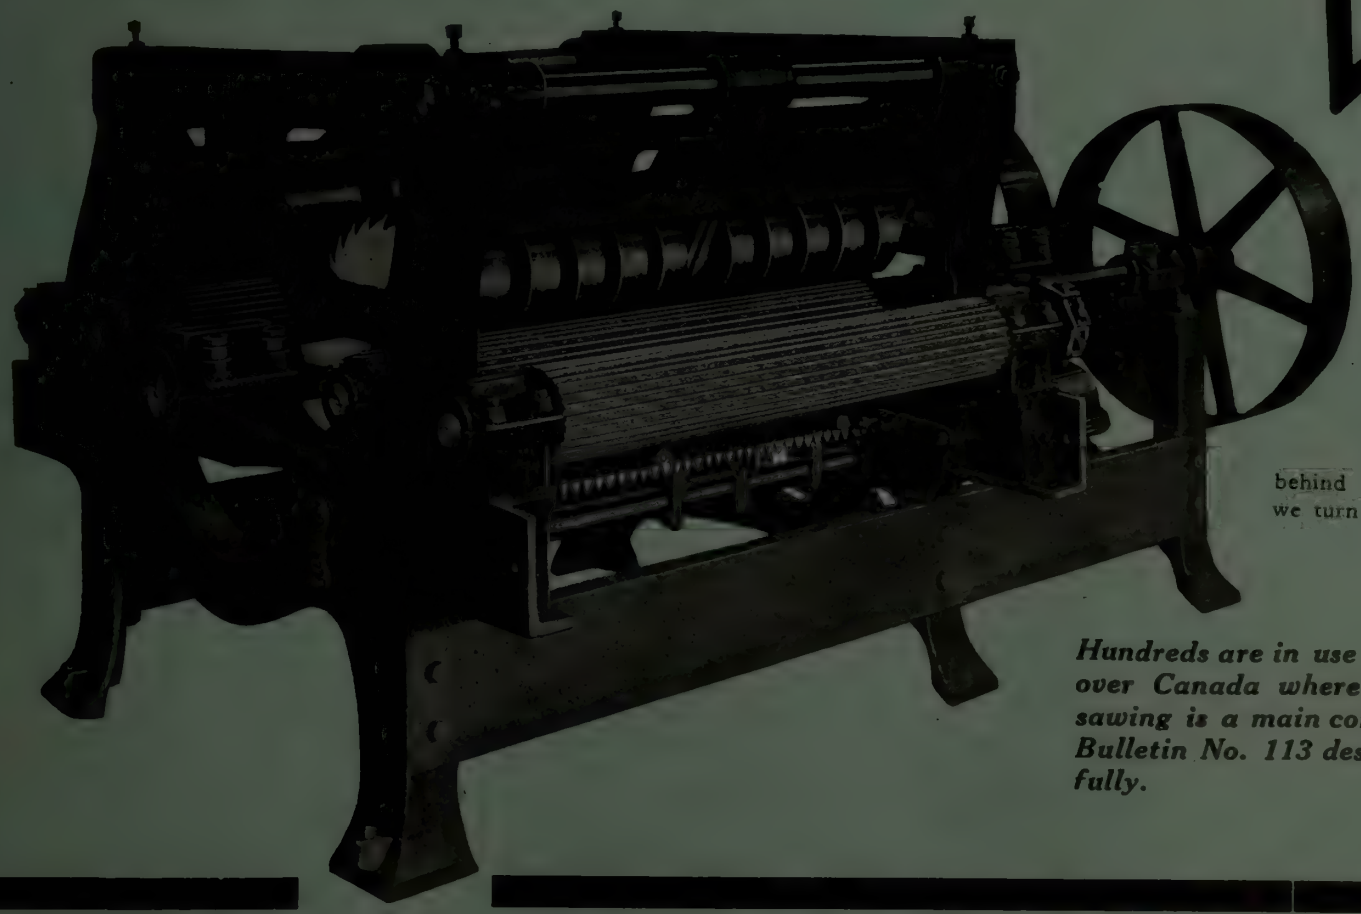
Catalogues on request

The press rolls are divided, too, making both sides of the machine independent of each other. It's a worth while feature, decidedly.

WATEROUS NEW CHAMPION EDGERS

are built with 40", 48", 56", 60" and 72" opening. They carry as many as four movable and two stationary saws without difficulty.

These edgers cut true and to dimension at all times. The guides are rigid and cannot shift in the cut. They are crowded to correct position and held immovably in place by a steel setting gauge that drops upon them. *No other edger has this feature.*



Waterous New Champion Edgers are fast and accurate cutting, easily operated, and perfectly safe. We stand behind every machine we turn out.

Hundreds are in use in mills all over Canada where quality of sawing is a main consideration. Bulletin No. 113 describes them fully.

The Waterous Engine Works Co., Ltd., Brantford, Canada

"FROST KING" METAL

$5,000,000.00
worth of mixed metal sold annually.

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price 30c per lb., Fort William and East; West of Fort William 35c per lb., delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, 40c per lb.; West of Fort William, 45c, delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

The "Feel" of a Good File

Did you ever watch a really capable mechanic test a file? He has a way of passing a sensitive thumb over its teeth. Instinctively, unfailingly, he thereby determines whether it is fit for use.

This man always chooses **Famous Five.** He never buys blindly. He can "feel" that a **Famous Five** is right. He can "feel" its sharp, keen-cutting teeth, arranged in rows of perfect uniformity. There is no doubt in his mind. He buys **Famous Five.** He makes sure of satisfaction.

Our catalog and copy of "File Filosophy" will interest you. Write for them to-day.

FOR SALE

Standing Timber

in Large or Small Blocks

and

Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery For Sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.
1 Double cylinder steam nigger, right hand.
1 Log Loader for right hand mill.
1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.
1 left-hand steam nigger.
1 Log-loader.
1 Endless chain jack ladder with two kickers complete for right and left hand mills.
2 Roger Gang Edgers for 8-in. cants and lumber.
1 Waterous double edger, 6 saws.
1 2-saw Trimmer.
1 20-ft. Slash Table.
1 16-ft. Revolving Slash Table
1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.
1 Lath Mill with bolter.
2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.
5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
2 125 h.p. Water Wheels.
1 Upright Engine for sawdust conveyor.
1 10 h.p. Engine.
1 Wood Machine for 22-in. wood.
1 Edger for ripping dry lumber, installed.
1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

The Corbet Automatic Double Cylinder Steam Towing Machine

Made in four sizes, accommodating Flexible Steel Hawsers from ¾-in. dia. up to 1½-in. dia.

A large number of our machines are installed on Tugs on the Atlantic and Pacific Coasts and on the Great Lakes.

They increase the efficiency and earning power of the Tug.

Does away with having to buy new Manilla Towing Hawsers every spring.

The Steel Hawser will last at least 10 years.

Keeps the crew contented and gives perfect satisfaction.

Read what one of our Customers says.

"TESTIMONIAL"

THE MIDLAND TRANSPORTATION CO.,
Midland, Ontario.

Messrs. The Corbet Foundry and Machine Co., Ltd., Owen Sound, Ontario:

Dear Sirs,—I have pleasure in reporting to you that the No. 3 Automatic Steam Towing Machine, which has 1,350 ft. of 1¼-in. dia. Flexible Steel Hawser on it, which you installed on the tug "Lucknow" this spring, has been satisfactory in every way. The machine has sufficient power to haul the cable in at all times while the tug is working ahead. The Automatic Valve works well when in bad weather, and we find no jerk on the cable. This machine is a big improvement and safer than the Manilla line.

Yours truly,
THE MIDLAND TRANSPORTATION CO.,
Per Capt. E. F. Burke,
Pres. and Gen. Manager.

An "All Year" Saving!—

Users of the MOREHEAD "Back to the Boiler" System for conserving steam heat, find that it is an all-year-around economy. It works continuously—a daily saver of fuel—a daily help in the operation of the plant.

The efficiency of the plant is improved because of the function of the

Morehead
Back to Boiler
SYSTEM

delivering pure hot condensation back to the boiler under pressure as feed water—saves boilers, saves fuel.

MOREHEAD "Back to the Boiler" SYSTEM stands for economy—every day in the year.

A Bond is a Purchase That Pays

THE ORIGINAL FOUR POINT HANGER.

From the day you put a Bond Hanger on the job, it starts saving your oil, your power and your patience.

It is an investment that yields a steady return with every revolution of your shafting.

The sturdy, braced construction, makes for smooth running without vibration. Its design permits full accessibility for adjustments or erection.

The Bond Hanger Book tells about everything we make in the line of power appliances.

Your files are not complete without it.

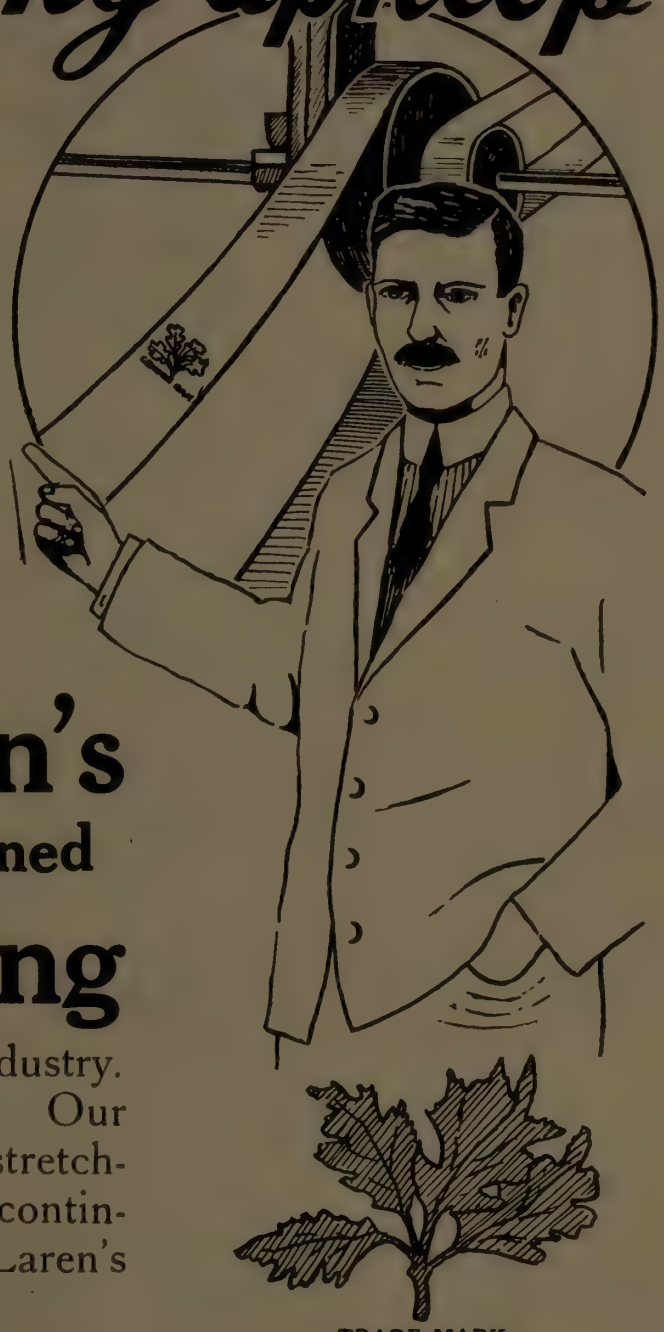
Your Belting Upkeep



THERE is one sure way of reducing your Belting upkeep to the minimum—get the best leather Belting for your particular use, in the first place. There is absolutely nothing to equal good back leather for Belting of all kinds and no leather Belting can surpass,

D. K. McLaren's
Genuine British Oak Tanned
Leather Belting

for the Lumber and Woodworking Industry. We use only flawless back leather. Our tanning process practically eliminates stretching. You get continuous service and continuous satisfaction with D. K. McLaren's Leather Belting.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 **Toronto, September 1, 1917** **No. 17**

Guesswork Leads to the Poorhouse

Judging from correspondence received recently, several articles which have been published in the Canada Lumberman dealing with the problem of cost accounting for the retailer and for the millwork manufacturer have touched a vital spot with many dealers. More and more it is becoming clear to the trade that in the past a great many firms have been too well satisfied with the easy-going methods that have grown up in their accounting work, and have not understood how closely they are travelling to the edge of a business precipice, until it was too late, or until some unexpected event has cleared their view temporarily and shown the dangers they were courting. Without having made any attempt to gather representative information from a large number of firms on this subject, it has been forced home to us lately that these conditions prevail with a large number of firms, and are not confined to those that are in a small way of business, but may be found in retail and millwork firms, both large and small. However, whether on account of the closer scrutiny of business methods that is being brought about by the war, or on account of a natural reversion from the former state of things, it is true that a great many such firms are housecleaning their accounting offices and installing more efficient methods which will guard them against the pitfalls into which some of their less fortunate fellows have fallen.

Some of the letters received contain remarkable confessions of shortcomings, but are none the less genuine. For instance, the whole situation as it is presented by these letters is forcibly and briefly told in one of them, written by a firm which formerly was getting along well enough, but which of late has been compelled, by the stringency of trade, to turn its critical eyes inward in a way which it never thought of before. "We read with interest your article in the August 1 issue about proper cost accounting ensuring success," this firm says in its letter. "We agree with you when you say that a great deal of business in millwork is guess-work, **and we are no exception.** We are willing to pay anyone who can outline to us a cost of material and selling price system that will show the proper way of doing business. We operate a woodworking factory and also do building. **We have a very good business, but are not making the money we should, and the reason is too much guess-work.**" Other firms have written in a similar vein, and those with whom we have talked about it have invariably corroborated these conclusions. One firm, for instance, which carries on an exceptionally large business and has been in operation for many years, took the matter up recently with the intention of enquiring into it thoroughly and introducing new methods if they were found to be necessary. The accounting system which this firm had developed was considered to be suitable and quite sufficient for their enormous volume of trade; but upon making a close and scientific study of the system, it was found not only to be inefficient but cumbersome. To make a long story short, this firm is now installing, in connection with its millwork business, a thoroughly efficient, flexible, and easily-understood accounting system, which will enable it in future to know exactly the cost of every article it produces. It will be able then to quote intelligently and to count upon showing a profit for everything it sells. Imagine what this must mean to a firm whose business amounts into hundreds of thousands of dollars annually. Not only will it sell nothing more at a loss, but in figuring upon competitive bills it will quote prices that are safe, and get the business or let it go to some other firm which is not conversant with cost details and is figuring so close as to be unsafe. Ignorant competition is the bane of millwork trade, and it will be a memorable day when the majority of firms learn how to abolish it. The existence of one or more firms in a town who are determined to estimate their costs properly and to get a good profit on everything will go a long way towards introducing better conditions generally. That this state of affairs will be brought about quickly is too much o expect, but the situation to-day is more encouraging than it has ever been before.

Closely connected with these matters is the question of credits. A loose method of handling credits and an inefficient way of estimating costs will do more than anything else to land a business in the hands of its creditors. Either one of these defects is quite sufficient for the purpose. With both problems solved, there is not a millwork or retail firm in existence that cannot weather the worst kind of industrial storm. The magnitude of these problems has been the great sticking point in the past. Many managers or owners have not been capable of analyzing their own cost conditions as they should be analyzed, or of introducing changes that are necessary. Others have hesitated because of the disorganization which they wrongly imagined that radical changes would involve; but some of them have found out by sad experience that a far more radical change was threatening unless they pulled up short. There are many others in the same quandary to-day, and the most valuable advice it is in our power to offer them is that they should start to-day and give the problems their fullest study until they have found a way out of the woods; and when they do see the light and get rid of their troubles, let them pass along the benefit of their experience to others. It is a big thing to have put your own house in order in this way, but it will be almost equally valuable to any firm to put its competitor upon the same track, and thus eliminate, so far as possible, all competition that is not based upon a sound knowledge of costs.

The Industrial Outlook

What the approaching winter will bring forth in the way of business conditions is being discussed more keenly to-day than is usual at this time of year. In the lumber business the trade situation is more important and interesting now than at almost any previous time, and it is exceptionally difficult to analyze, so far as the future is concerned. There has been a strong demand all through the year for everything that the sawmills have been able to produce, and much green stock has been taken straight from the saws. It has been impossible for the mills to produce as much stock as the market required, and had it not been for the fact that the railways were not able to move stocks fast enough, there would have been nothing at any of the mill points but bare yards. Such stocks as have been piled by manufacturers are practically all sold and awaiting shipment.

Many manufacturers have been disappointed in connection with the operations at their mills this season because they have not been

able to produce any surplus beyond the amount that they contracted to sell earlier in the season. Most manufacturers make a practice of trying to turn out some additional stock beyond what they have sold, so that they may be in the position to make a little extra profit out of it in case the market conditions improve. At the beginning of the present year the outlook was for continued advance in prices, and this has been more or less realized throughout the year, so that, if the manufacturers had been able to obtain sufficient labor they would have turned out larger stocks. However, manufacturers have done well on the whole during 1917, and the general opinion is that they will operate in the woods during the coming winter to the limit of their resources, regulated, of course, by the quantity of labor they can obtain.

Whenever one discusses the situation with manufacturers, the labor supply and the high cost of provisions and equipment are the only matters considered. Everyone agrees in regard to these factors, and expects that lumber prices will continue to stiffen, or at least will hold their present levels, well into next year. One or two wholesalers, however, report that the retail trade are not quite so ready to accept this interpretation of the situation, and if one takes into account the views of those who are engaged in other lines of manufacturing it becomes evident that other factors are getting a great deal of attention to-day. The retailers referred to above hold the view that prices of lumber have reached their high level and may be expected to recede. It is difficult to give weight to such views under present conditions, or to convince one's self that they are not more or less a case of the wish being father to the thought, but this opinion is held in many quarters.

It is probable that those who are anticipating a fall in prices, or a decline in trade conditions generally during the coming winter are influenced in their views by a study of the outlook in connection with the munitions industry. Inasmuch as the future of this industry is something no one can foresee, nothing can be said with confidence regarding it. All that it is possible to say is that of late the Imperial Munitions Board have not been letting contracts for munitions or for shell boxes to any like the extent that prevailed a year ago. This is interpreted by some as meaning that the British Government is gradually taking over the production of munitions entirely, and that Canadian plans will have less and less of this business in future. Certainly the actual course of events during the past twelve months points rather convincingly to this conclusion, but just as certaintly it is not reasonable to come to any conclusions one way or the other about such an unsettled matter.

Sooner or later the people of Canada must experience the end of the munition production business, and, from an industrial point of view, it will be better that the end should be brought about gradually than suddenly. There are a great many employees engaged in it at large wages, and when they are thrown out of employment it is a question whether the other industries of the country will be able to absorb them fast enough to prevent industrial depression. Undoubtedly these employees will, in a great many cases, be unable to obtain employment again at such good wages as they have been receiving, and this will have a decided effect upon the buying power of the people. We can look forward, therefore, to a marked effect upon trade whenever the munitions orders cease. It is with this fact in mind that many people, seeing the lull in the production of munitions that has prevailed lately, are anticipating price declines and industrial depression to some extent during the coming winter.

The sitaution has so many aspects that it is not wise to do much anticipating. Suppose, for instance, that the munitions business comes to an end and about two hundred thousand people who are engaged in the production of shells or in subsidiary industries are thrown upon the labor market, what result may be expected? In the first place, other industries which have been starved because of labor shortage—among them the lumber industry—are likely to benefit by the change, and to find that it is possible once more to operate nearly to capacity. It is probable, also, that a number of those who are thrown out of employment will enlist for service overseas. In short, conditions to-day are more favorable than many believe for absorbing labor that will be laid off when the munitions industry comes to an end, and if the change is brought about gradually there may be little disturbance during the readjustment. It will be well for the country if the change is brought about in such a manner. These matters are being discussed to-day in all quarters, and the course of the Imperial Munitions Board is being observed closely, in the belief that it contains the key to the situation.

One feature which must not be lost sight of is the possibility of important developments in connection with the munitions industry in the United States. If the war continues for some time, and the United States requires large quantities of munitions, it is more than probable that Canadian munition plants will share in their orders for some time to come, on account of the fact that they are already so well equipped for the work, and that it will take the United States a considerable time to organize and develop its industry as fully as required.

Helping One Another—The Spirit of Association Work

One of the interesting developments in connection with lumber association work in the United States which was hardly foreseen in early days, is the growth of co-operation between associations representing the different elements of the industry and the trade. This is a natural enough growth, in fact simply an enlargement of the work and the ideals which associations necessarily involve. The origin of association work in the lumber trade was more definitely among small local groups than anywhere else. Manufacturers in definite districts, and retailers similarly situated, found that by working together they could promote their mutual interests more successfully and aggressively than by individual effort. Some of these earlier associations failed and others succeeded, in proportion largely to the enthusiasm of their members, but a sufficient number of them weathered the earlier storms to establish the movement firmly, and the country by degrees became more or less honeycombed with associations of various types representing retailers, wholesalers, salesmen, millwork firms, manufacturers and logging operators. During the past five years, these associations have become so valuable an element of the life of trade, that there is absolutely no question about their now being firmly established as a permanent business institution.

Reaching out continually for new fields of activity and service, the leading spirits of the association movement have recently learned that the effectiveness of their work is not confined to their own individual business circles; that they are, in short, a part of a larger movement than their own, to the same extent as their own lines of business are integral parts of the whole lumber producing and distributing industry. The discovery of this fact has led to co-operation among the retail, wholesale and manufacturing associations, so that today, many of these associations are doing work of an importance and extent far beyond the conceptions of their founders.

Perhaps the most striking example of this is afforded by the National Lumber Manufacturers' Association of the United States, which founded a retail department last year and put in charge of it a man who had made a name for himself as probably the most aggressive manager of a retail lumber yard in the United States. Seeing how successfully he had put his ideas into practice, they took him over with the object of having him teach these ideas to retailers all over the country, thus showing them how to make greater use of their opportunities, how to become more successful, and at the same time more serviceable, to their customers. It might appear to some manufacturers at first that this kind of thing savoured a little of interference by the manufacturers with the private affairs of the retailers, but the truth of the matter is that the retailer has no private affairs of this nature. His success makes or ruins the manufacturing industry and probably the most important thing for the manufacturer to concern himself about, outside of his own producing affairs, is the welfare of those upon whom he depends for the sale of his product to customers.

It was with this idea in mind that manufacturers took the matter

in hand, and during the few months since this branch of their work was started, they have obtained the sympathy and the gratitude of the retail trade. It may be somewhat rash to make predictions in this connection, but there are those who already foresee the coming together of all the lumber associations in the United States in order that the different branches may be more effective and successful. This centralization of work in connection with matters of mutual interest is the germ of association work and apparently, in a much wider sense, will become its goal.

The situation in Canada presents a disappointing contrast with that in the United States. Whatever the cause may be, association work among lumbermen in Canada has only been partially successful. How to explain this, or to remedy it, is a difficult problem. It is not a question of locating blame, for those who have worked for the cause have only thanks due to them, but for one reason or another in a number of cases Canadian associations have passed away after a short life, or have not been able to arouse their members to sufficient enthusiasm to enable them to reach any encouraging approximation of their natural ideals. There is no reason, however, for discouragement in this situation. It is only by experience that we learn the proper ways of accomplishing things that are worth while, and lumber associations in Canada will some day become as strong a factor in the life of the industry and trade as they have become in the United States. We feel confident enough of this to assert it. Those associations which have succeeded are now numerous enough to offer valuable examples to others that are in their early stages.

There is one thing which the lessons of the past and the examples of the present point to strongly, namely, that association work can succeed only where it is absolutely unselfish in its ideals, aggressive in its methods and justified by existence of community of interest among its members.

In the early days, great lumbering firms developed and their successors today have inherited the spirit of independence which enabled their founders to overcome great obstacles. They maintain a natural feeling of pride in the achievement of their predecessors which sometimes keeps them from lending to the association movement the valuable aid they could afford to give it. But the day has come with the growth of producing facilities, accompanied by keener knowledge of selling methods, when this conservatism, well as it served its purpose in the past, is out of place. The associations of today call for something bigger, better and more manly. In Canada today, the lumber industry with all the competition it has to face from substitute materials and all the problems which it has to solve in connection with raw materials, labor, transportation and legislation, is at the crossing of the ways and is facing a crisis which is being intensified daily by the war, and will be greater probably than any of us can foresee. Nothing whatever in all the catalogue of business endeavor will serve to carry the trade through the mazes of industrial struggle which lie before it, so well as co-operation. No time given to this work now will be in vain. The times are calling for it, industry and trade need it and the lessons drawn from the past show how to go about it today with practical confidence of a successful outcome.

A Character Talk to Business Men

It Takes all sorts of men to make up a world, and one of the kind we meet sometimes in business is the man who is always grouching. Everyone knows him, and although we do not like to see him come into our offices, we often feel a bit of sympathy for him and wish we could set him upon the right track. There are not many of these men in the lumber business. Somehow or other the diversity and importance of the lumber business makes men bigger and more tolerant than those in most other lines of trade, but now and then one of these chronic grumblers turns up. There are only two things to do with such a man. One is to discourage him and make his troubles still worse. The other is to hold him up before himself for examination, and sometimes this drastic kind of treatment does him a world of good. Here is the way it was done recently by a successful lumberman when one of these fellows called. The story is told by a contributor to the Southern Lumberman, and we give a summary of it because of its human interest and because of the unique nature of its chief points. The grouch and the successful business man had finished their talk, and as the former was about to leave he opened upon the latter with a list of his troubles. Having started, he continued until he had poured them all out, and then the successful business man gave him his reply. This is what he said:—

"Smith. did you ever go to a picture show? And did you ever see on the screen a horrible picture that you did not like? Well, now, if you wanted to remove that disagreeable picture, would you try to rub the picture off the screen, or would you go back to the picture machine and change the slide? Perfectly simple! Of course you would change the slide and the picture would be changed instantly, whereas all the rubbing and scrubbing on the screen would never remove it. And that is exactly what you need to do.

"Your consciousness is, figuratively speaking, a moving picture machine, and you've a bum set of slides, that you need to get rid of. Just change those slides that you are using and get an entire new set and you will have a very different lot of pictures from the ones you have just outlined to me. I don't know a thing about your home life or your habits, but I can pretty well tell you the kind of slides you are using in your machine most of the time. For instance, you go home in the evening and you get cross because the baby cries, you growl because the dinner is either too late or too early, you fuss at the wife because the coffee is too cold or too weak, you think the rest of the family are out of sorts and nothing suits you; you get up in the morning, your eggs are either too soft or too hard, the paper boy is late with the morning paper, you start down town and get out of patience because you just missed a car, then you get sore because a good-natured fat fellow sits down beside you and you think he is taking more than half of the seat, you inwardly bawl out the street car company for its slow cars and rotten service, and then when you get down town you go through the rest of the day grinding out nothing but these bum slides all day long.

"Now. let's change your slides for a different set and just try it for one whole day and come back to see me tomorrow and let me know how you like the new slides. When you go home this evening just think what a happy sound it will be to hear the baby cry and take him up and have a romp with him, tell the wife how nice she looks when she meets you at the door, and if dinner is late, just say it doesn't make any difference, and give everybody in the house a chance to feel good, brag a little on how nice the coffee is, and incidentally make yourself interested in the different members of the family and how they have spent the day, and see just how many little things you can say and do to make everybody around you have a good time.

"All I ask you to do is to change your set of slides for the ones I am telling you about, and then come in to see me tomorrow. I want to hear the result."

The next day Smith reported, all smiles—he was a different man from the Smith of yesterday. He said, "Brown, that's the greatest set of slides in the world that you told me about yesterday. Why, when I got home last night the wife was all dressed up in a new dress and came down the sidewalk to meet me with the baby, there was not a single complaint from any member of the family all evening, and everybody had such a good time that we almost forgot to go to bed. The first thing this morning after reaching the office a man who I thought was trying to injure me came around with a proposition that means the straightening out of my business, and everything is just fine."

Changing slides was all that Smith needed in order to get a different view of things, and when he got the right kind of slides he found that his entire attitude toward life was changed. When things go wrong and the road seems "up hill all the way," let's remember that all we need is a new set of slides.

Canadian Hardwoods Active

The hardwood trade in Ontario, according to one of the most extensive wholesale firms, continues on an active basis, particularly with regard to exports to the United States. Much difficulty, however, is being experienced in making shipments, as most of the Eastern ports are under railroad embargo. There is still a great deal of lumber to be purchased during the present season. The fact that the trade has been well warned in advance of the certainty of a car shortage during the coming fall is inducing them to purchase some of their stocks ahead of time, and they are now coming forward with orders of this nature to a slight extent. If any stock can be said to be lagging at all it is probably some of the high-grade lumber that is used in interior finish, but there is enough other trade to take care of this class of stock so that even these lines are not seriously disturbed.

The present outlook is that there will not be as great a quantity of hardwood available after the end of the present year as there was when the trade entered 1917, and on this account it is reasonable to anticipate continued firm and advancing prices. Thick birch is in good demand for vehicle work, chiefly connected with war orders, and considerable 6/4 and 8/4 birch is also coming into this line of work.

There is a reasonable demand from the furniture trade, and a peculiar feature is that, notwithstanding a lack of building operations, there is a good demand for hardwood flooring. The low ends of hardwood are being taken up as fast as they appear.

Plenty of Aeroplane Spruce

The special mission of the Allied Aircraft Board have been paying an extensive visit to spruce manufacturers on the Pacific Coast. Recently they visited a number of American cities in the States of Washington and Oregon and conferred with manufacturers regarding supplies of spruce. As a result of the conferences they have complete assurance that a sufficient quantity of spruce for the aircraft requirements of the allied governments will be forthcoming promptly. It is estimated that within the next twelve to eighteen months the allies will require 117,000,000 feet of spruce. Special committees have been appointed in the spruce-producing districts of these states to attend to the details of the work of production.

Information received recently is to the effect that spruce is the only wood the exportation of which will be restricted under the law which gives President Wilson the power to control exports. Under the new arrangement spruce exports will be subject to license, which can be obtained from the Exports Council. and these licenses will make it unnecessary to get further permission from the British authorities to make shipment. The price will be the same to the allies as to the United States Government, namely $105 per thousand feet. As to other woods, it will still be necessary for exporters who desire to send stock to the United Kingdom to get licenses from the British timber controller.

High Lead System Subject of a Lawsuit

The widespread use of the high lead logging system which has developed of late years on the Pacific Coast, both in the United States and Canada, is causing many loggers to take a close interest in a lawsuit that has been filed by the estate of H. D. Robertson against the Campbell Lumber Company. of Seattle, Wash., which operates a logging camp and sawmill near Redmond. The company is being sued for an infringement of a high lead patent. The plaintiff claims that the late Mr. Robertson in 1905 obtained a patent which it is alleged has been applied by the Campbell Lumber Company, and is now generally in use elsewhere. The plaintiff states further that Mr. Robertson "was the true and original and first inventor of the high lead logging apparatus, and that it has been and is a great advantage to the logging business, and that the estate and heirs of the late Mr. Robertson will realize and receive large profits from the invention if not prevented from the use thereof. The plaintiff asks damages as a result of the alleged infringement, and requests that an injunction be issued preventing the Campbell Lumber Company from using the high lead patent.

Skillings, Whitneys & Barnes Reorganized

The Skillings, Whitneys & Barnes Lumber Company, for many years a $1,000,000 Massachusetts corporation. with headquarters in Boston and large yards and mills in Ogdensburg, N.Y., has been reorganized into a $810,000 New York corporation, and the headquarters will hereafter be in Ogdensburg. The reason for the change is that there has been a gradual change in the character of the business, and the greater part of the company's property and interests is now centered at Ogdensburg. Dewitt C. Culver, of Ogdensburg, has been elected president and treasurer of the new company. David N. Skillings, of Winchester, Mass., is the secretary and a member of the board of directors. The other directors and principal owners are David C. Whitney, Detroit, Mich.; Henry J. Bartlett, Orillia, Ont.; Senator George Gordon, Cache Bay, Ont., and George L. Ryan, Ogdensburg. The Boston offices will be continued as the principal sales offices for the New England territory, with George L. Davis as manager. Sales offices will be continued in other cities as heretofore, without special change in the sales organization. The company deals extensively in Western and Northern woods of all kinds.

Would You Consider This Profiteering?

The high rates for ocean vessel space have seemed to shippers to involve profits beyond the reasonable limit, even taking into account the great risks of destruction that must be run. There are some elements of the situation, however, that shippers may overlook, and by way of presenting the other side of the case in one of its aspects we publish a letter which appeared recently in "The Timber News," of London, Eng., from which readers may draw their own conclusions. The letter is as follows:

Sir,—We are the consignees of the cargo of spruce deals per a Danish sailer, 1,123 tons, from St. John, New Brunswick, which has just arrived in the Mersey.

The ship had a most eventful voyage, replete with vicissitudes from the time she left this side in ballast(about ten months ago) to load the cargo.

Having regard to the loss of time and a heavy repair bill, the voyage must have been anything but profitable to the ship, notwithstanding the high freight.

When she arrived at the Bar, one day last week, she met with another pleasant little surprise by way of adding to the loss on the voyage, viz., in being asked £300 for towage up. The captain promptly refused, and came up under his own sail, and we must say we admire him for his pluck.

The tug followed on behind, and all she got out of it was the docking charge at the statutory rate.

We don't say this is "profiteering," which word is not "popular" nowadays, nor do we use any adjectives or apply any opprobrious terms. Yours, etc., H. W. Lightburne & Co., Liverpool.

The Hardwood and Spruce Concessions

The Timber Trades Journal, London, Eng., in a recent issue, says: "It is to be much regretted that the orders issued by the Board of Trade are not compiled more lucidly, so that the much-ordered timber trader can gain from their perusal what is their exact meaning. As a rule, every new order requires an explanatory supplement. The softwood trade were congratulating themselves that the relaxations of restrictions on the imports from Canada and the United States would be of help to them, as they will prove to be, but very few were of opinion that the order also referred to hardwoods. In reply to enquiries made, we have received from the Deputy Controller of the Department of Import Restrictions of the Board of Trade notice that all descriptions of timber may be imported into this country from Canada and the United States of America when carried in neutral sailing vessels, under license; and that a general license has been issued to H. M. Customs to admit into this country (without a special license from the Board of Trade) all descriptions of timber when carried as deck cargoes from Canada and the United States of America. We also learn that sailing vessels may be chartered before applying for a license, and that licenses will be positively granted after the vessel is chartered. provided the vessel is a neutral sailer."

Increasing Hardwood Production Costs

At the recent semi-annual meeting of the National Association of Box Manufacturers the chairman referred to trade conditions as follows:

"I want to speak of lumber conditions as they exist in the West to-day. In Chicago we get lumber from all parts of the country, with the exception of the East. Yellow pine producers are now selling their lumber to the United States Government, at the mill, log run. for $35. The average price for yellow pine lumber during 1916 was $17.40. That gives you some idea of the advance in price of yellow pine. The market for other classes of Northern hardwoods has advanced in somewhat the same proportion. Cottonwood is so high in price that it is practically eliminated, and is not in the competitive class any longer as a box material. Gum has gone up about the same as No. 4 boards.

"Prices on nails are about three and a half times what they were three years ago. Everything we use in the way of supplies has gone up, such as belts, planer knives, oils, files, etc.

"Next to raw material, wages is the most important item in manufacturing the products we sell. We are paying labor high wages—double what we paid years ago. Still, I do not see how the men can live to-day, even with the high wages, when they have to pay such high prices for everything they use. I wish we could afford to pay

more. But the wage feature is not the bad part of the labor problem. The real difficulty for us is to get the men to operate the plant. Labor is shifting around a great deal. Some men are going to war in France; others are enlisting in the army, or are drafted for this great army we are raising, and we have left a very inefficient quota of men to do our work.

"Some criticism has been made that manufacturers are trying to ride the present market too hard. But so far as our business is concerned, I do not see how we can pay the high lumber prices, and the higher prices on everything else, and not get more for our products. That is the thought I want to impress upon you. In this connection I want to say something else to you. You may have a large supply of lumber in your yard which you have bought at low prices before the rise in the market. Let me tell you, the men who are making money, or will make money. in the box business are those who base their prices on the lumber market and the supply costs as they are to-day, and not upon the prices they have paid for these materials. For as soon as you use up the lumber you have in the yard you are forced to go out on the market and replace it with higher priced stock."

Special Commission's Report on European Markets

Everywhere in America and in England, the pine of the provinces of Quebec and Ontario is known as without equal in the world. In France there is little interest in its qualities. British Columbia fir, thanks to the extensive propaganda by the government of that province, is beginning to be appreciated in certain places, but it has a formidable competitor in the pitch pine of the United States. With the freight charges in existence even before the war, it was impossible for Canadian woods to compete with the products of European countries. When it is considered that in normal times the cost of transportation constitutes over 40 per cent. of the selling price of wood in the French market, it will be seen that the freight rates are one of the most essential factors of this business.

The cost of transportation, revealed by the above proportion, does not seem at all justifiable, especially if it be compared with the cost of transportation of lumber coming from the ports of the Baltic Sea.

The lack of direct steamship communication is another obstacle and one of the most serious. Our exportation has been carried on almost exclusively through England. On the English market our British Columbia wood is robbed of its national character. It is lost in the midst of the products of other countries and is sent to France under names that in no way indicate its origin. At times even dealers sell it as wood from "the North." Our forest products have an undeniable value, and it is essential that their value be known in France and attributed to Canada, in order that our merchants and the country at large may reap the benefit.

In order to secure a place in the French market, Canadian producers must first of all make Canadian products known. To attain this end, there is but one practical and efficacious way, namely, to show them to possible purchasers. Printed matter, advertisements and lectures by commercial agents will never convince the French people of the value of our merchandise. They must see it, feel it and be convinced for themselves.

Again, our merchants must come into personal contact with the French market in order to thoroughly understand its needs and even its smallest requirements, if they wish to compete with other countries. In this connection it will be well to remark that Canadian lumber should be more carefully sawn and also more in accordance with the dimensions required by the French market. Merchants of the Dominion should also realize the importance of providing their salesmen with all the information necessary in order to reply to the questions of the French consumer, such as the weight of the wood per cubic metre, per standard, etc.

Canadian Conditions Discussed in Louisville

An interesting discussion of conditions in the Canadian lumber industry was heard at a recent meeting of the Louisville Hardwood Club. W. H. Stubbs, Canadian representative of the Card Lumber Company. of Chattanooga, a guest at the meeting, gave some personal experiences in this connection. Mr. Stubbs stated that the piano trade had been very hard hit, being unable to obtain skilled men, especially in the woodworking departments. One good customer in Canada had lost 37 men recently, and was almost forced to close down the woodworking shops, being unable to obtain men to replace those lost, the skilled laborers in many cases going into the army far more readily than unskilled labor. This piano manufacturer had been forced to buy piano cases from New England manufacturers, paying a duty of 30 per cent. and a war tax of 7 per cent., but had been unable to do anything else in face of the labor situation. Construction companies had also been having their troubles, and in several cases had been unable to complete contracts within specified time limits. However, business in Canada was good, but would be far better with a fair supply of labor.

From the Canada Lumberman of Thirty-five Years Ago

Hemlock to the Fore

Hemlock is fast attaining prominence as one of the most valuable among the soft woods. Its adaptation to numerous uses is being more fully recognized, and this once despised wood is coming prominently to the fore as one of the most useful in the catalogue. The memory of the writer carries him back to the time, not very many years, either, in the vista of the past, when in the purchase of lands for lumbering purposes in the Saginaw Valley, hemlock was left entirely out of the calculation, and thousands of acres containing vast quantities of hemlock have been allowed to revert to the state after the same had been denuded of the pine, because the hemlock was considered practically worthless except for the bark, and that could not be utilized because of the lack of transportation. These hemlock lands loomed slightly into prominence a few years since at the time of the hemlock extract boom, when several extract factories were established in the state, but the "great expectations" of the stockholders in hemlock extract bonanzas appear to have vanished into thin air or in a fruitless search for profits which their projectors had promised. Up to within a few years hemlock was considered worthless, except for fencing, joists, or for some of the purposes for which rough, coarse lumber was demanded. But as pine has advanced in price and is growing scarcer, necessity has demonstrated that hemlock is especially adapted, not only for coarser work, but also for inside finishing, and is being utilized in its natural state . . . . . being found capable of extraordinary fine polish . . . . . for such purposes, in some very expensive structures. As an illustration we might cite a church in a neighboring city, finished principally in hemlock in oil, in which is displayed some of the most beautiful specimens of natural graining, in the panel work, which can possibly be produced. It has been ascertained that hemlock is adapted for almost any of the uses to which the soft class of woods has heretofore been applied. The popular favor with which it is being received has resulted in rapidly enhancing the price of the lumber, as well as the lands on which the timber is located, and hemlock stumpage has appreciated in value to such an extent that in some sections it is ruling higher than that received for pine land stumpage a few years ago. This may have been partially induced by the speculative mania which has lately set in for the possession of timbered lands, but not wholly so; and because of the utility of the lumber for almost every conceivable purpose, it is safe to predict that hemlock will maintain a much higher figure in the future, and be received with much greater favor than in the past, and those who through foresight, or inability to dispose of them, have retained possession of these lands, will find they have struck a bonanza.

The Silent Moment

The trouble with most salesmen is not that they talk too little, but that they talk too much. They should learn that in every argument with a customer, or an intending customer, there should be a cessation of the flow of talk—a rest period, so to speak—in which the buyer can think. I call it the "silent moment." In every deal it should be observed. The customer likes to think he makes the decision.

When you have presented the case—stop talking. Let the customer think it out. I have seen many salesmen talk themselves into a purchase and then talk themselves out of it. It is the power of the suggestion that counts. The customer does not like to be driven. If he does buy after a forced sale he will never return. Give him time to think the proposition out—only be sure he is thinking your way. Make your statement brief, forceful, and then rest.

In making a sale don't argue. It arouses opposition. In advertising, nothing is more futile or useless than to carry on an argument. Avoid the direct assertion that your goods are the best in the world. State it as if it were a recognized fact. In writing your advertisements you can rely on such statements as "as is well known," "as you know." And don't attempt to say too much. My rule is to take only two big "leads." The people can't take any more than that. For example, if you say. "As you know, goods bought at our store will be delivered at 3 p.m.," you have not exceeded improbability—you have struck at a live feature of your service, and you have not argued. Let the power of that suggestion work in the customer's mind. Indirect suggestion is even more powerful than the direct. The primitive emotions are keener than the intellectual. Sixty-seven and a half per cent. of men's grouches are pure imagination. A person may never be won by argument. He may never see the force of your statements made in print, but if he is caught by an indirect suggestion he will fall nine times out of ten.—Dr. Stanley L. Krebs.

Kiln Drying Lumber—Its Main Problems

Principles of Compartment and Progressive Kilns Clearly Explained—Different Methods of Piling Stocks for Artificial Drying Treatment

Kiln-drying lumber is the subject of a special report upon the seasoning of wood published as bulletin 552 by the United States Forest Service. Lumber is kiln-dried, the report says, when there is need for seasoning it quickly of when the manufacturer does not wish to carry large stocks in his yard. A kiln is used also to further dry partially air-seasoned or even fully air-seasoned material, for special uses.

The main problem in kiln-drying lumber is to prevent the moisture from evaporating from the surface of the pieces faster than it is brought to the surface from the interior. When this happens the surface becomes considerably drier than the interior and begins to shrink. If the difference in moisture content is sufficient, the surface portion opens up in checks.

The evaporation from the surface of wood in a kiln can be controlled to a large degree by regulating the humidity, temperature, and amount of air passing over the wood; and a correctly designed kiln, especially one for drying the more difficult woods, should be constructed and equipped in a way to insure this regulation.

A dry kiln may consist simply of a box in which lumber can be heated, or of a good-sized building or group of buildings (battery) containing steam pipes, condensers, sprays, and various air passages capable of adjustment to regulate the amount of ventilation. The elaborateness of the kiln depends, of course, mainly upon the value of the lumber that is to be dried. For lumber worth $100 per 1,000 board feet, it obviously will pay to use more careful drying methods than in handling material valued at $20 or $25 per 1,000 board feet.

Types of Kilns

Kilns for drying lumber may be divided into two general classes, as shown in the illustrations: (a) compartment kilns, and (b) progressive kilns. In compartment kilns the conditions are changed during the drying process, and all lumber in the kiln is dried at one time. The conditions at any time during drying are uniform throughout the whole kiln. In a progressive kiln conditions at one end differ from those at the other, and the lumber is dried progressively by being passed through the kiln. Compartment kilns are used when it is desired to dry lumber of various sizes and species, while progressive kilns are used where uniform stock is handled.

The methods of operation generally used in lumber kilns are: (a) natural ventilation, (b) condensing, and (c) superheated steam.

In kilns operating by natural ventilation, the humidity or dampness is controlled by the use of escaping steam and evaporated moisture. Circulation in progressive kilns is largely longitudinal and in compartment kilns transverse. Moist air is allowed to escape from the kiln.

In condensing kilns the humidity is controlled by recirculating the air, which has taken up water from the lumber, across water pipes or through water sprays. The temperature of the pipes or sprays governs the amount of water that condenses from the air, and consequently regulates the humidity of the air when reheated before being passed over the lumber again. The circulation of air may be either natural or forced. Cendensing kilns are generally of the compartment type.

Kilns operating with superheated steam are used only where the species to be dried are not injured by high temperatures, and where fast drying is essential.

Lumber may be piled on the trucks which carry it into the kiln in any one of three ways, as illustrated: (a) fiat or horizontal, (b) edge or vertical, and (c) inclined. Flat piling is best for longitudinal circulation. It is not so well adapted for transverse circulation, and is not economical for downward circulation. Vertical piling increases the truck capacity, as there are no vertical spaces between the boards. Probably it is the best method for downward or any fast circulation. Provision has to be made, however, for keeping the boards in place in the stack. Inclined piling allows for a definite movement of air either downward or upward (forced draft). It is an improvement, as regards circulation, over horizontal or flat piling.

Some kiln operators using the flat or horizontal method of piling report excellent results from the construction of a V-shaped opening in the centre of the truck pile. Such openings are from 2½ to 3 feet wide at their base, and from 3½ to 4 feet high. Where this practice is followed it is customary also to place the boards in the layers closer together as the top of the stack is reached, to force greater lateral circulation.

In loading lumber on kiln trucks by any one of the three methods mentioned, the stickers should be of a uniform thickness and arranged in the piles in alignment.

It is advisable also not to attempt to dry various thicknesses of lumber together. Thick lumber takes longer to dry than thin lumber, and when different thicknesses are mixed the operation has to be governed by the thick stock, to the possible detriment, or at least the unnecessarily long drying, of the thin stock.

Preliminary Treatment

Lumber to be kiln-dried is sometimes steamed in a separate compartment before being placed in the kiln proper, especially where the kiln is not designed for moist-air treatment. In transferring lumber from a compartment for preliminary treatment to the kiln proper, every care must be used to avoid a sudden change in humidity. The object of the steaming is to heat the lumber and thus make easier the transmission of moisture from the interior to the surface, and also to moisten the surface in case it has become case-hardened or "set" during partial air drying. Other effects, also, are produced, which to a greater or less extent change the properties of the wood. The "sap" in the wood is changed by "cooking," as indicated by a darkening of the wood, the degree of coloring depending upon the temperature and duration of the process. Other changes of a chemical nature apparently also take place in the wood during steaming.

The pressure and duration of steaming desirable in kiln-drying

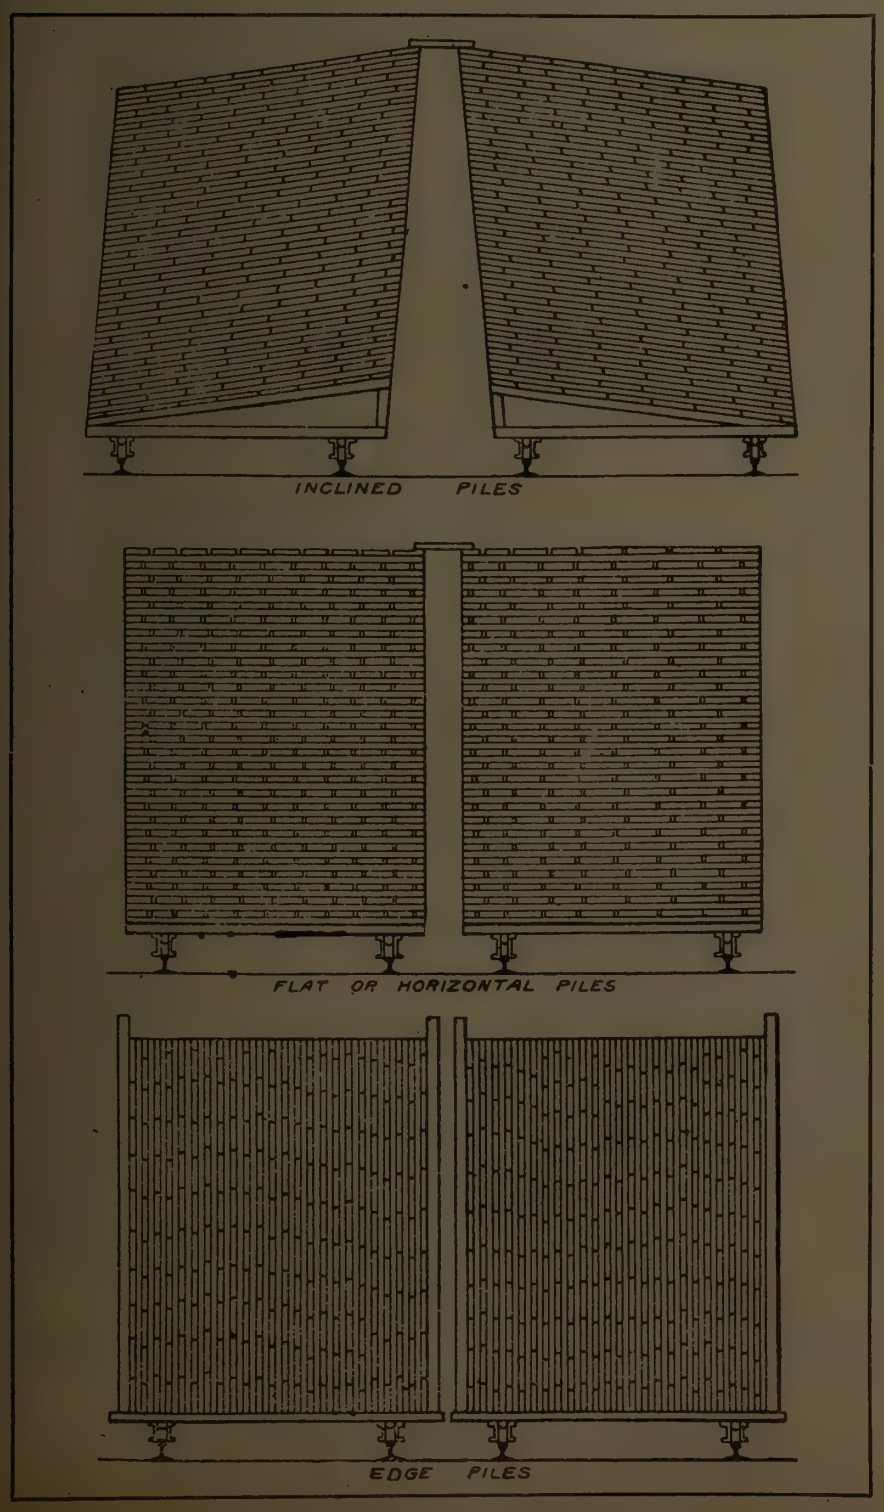
COMPARTMENT KILN

PROGRESSIVE KILN

have not yet been thoroughly worked out. Durations of from 5 minutes to 24 hours or longer, and pressures ranging from atmospheric to 50 pounds gauge, have been used in practice. The higher the pressure the greater is the effect produced, and the longer the time the more thoroughly the treatment penetrates the wood. Experiments have shown that a pressure slightly above atmospheric for 24 hours will slightly darken 2-inch maple clear through, and a pressure of 40 pounds will turn oak and probably other hardwoods almost black. Even where the strength of the wood is not the primary consideration, it probably is not safe to exceed 15 pounds gauge pressure (250 degs. F.), except for special purposes.

The Process of Drying

After the wood has been heated thoroughly in a humid atmosphere, either in the kiln proper or in a separate compartment, it is ready to have the moisture removed by evaporation from the surface. In kiln-drying uniform circulation apparently is the most important thing to be secured. The fact that air when it enters the drying chamber will be cooled, and therefore will tend to fall, should govern the method of piling and the direction of circulation. This means that the air should be allowed and assisted to pass downward through the pile, either by entering at the top of the pile or by an adaptation of this principle to other methods of piling. The rate of evaporation may be controlled best by regulating the amount of moisture in the air (relative humidity) circulating about the lumber in the kiln; it should not be controlled by reducing the air circulation, since a large circulation is needed at all times to supply the necessary heat. Air at 100 per cent. relative humidity contains all the water it can carry and has no effect in drying wood. If, however, the humidity is reduced to 90 per cent. and the air then passed through a pile of wet lumber, the air can take up a certain amount of moisture. If drying does not progress rapidly enough with the circulating air at 90 per cent. humidity, it may be reduced still further. This may be accomplished by ventilation, by condensers, by water or steam sprays, or in a number of other ways. Any well-made kiln which will allow the control of the humidity, temperature, and circulation of the air passing over the lumber should give satisfactory results. If checking begins during the drying process, the humidity should be increased until it stops. Steam jets in a kiln are often useful for this purpose. In changing the humidity the circulation should not be reduced. A large body of moving air is necessary in order to keep a uniform temperature clear through to the centre of each piece of wood in the pile and at the same time supply the heat required for evaporation. If sufficient circulation is not secured, the supply of heat for both purposes will be lacking and the material will not dry uniformly.



The maximum rate of drying at a given temperature is reached when moisture is evaporated from the surface of the wood just as fast as it is transmitted from the interior. This rate is fixed by the rate of transmission of moisture within the wood and varies with different woods.

The temperature of drying apparently influences the rate of transmission of moisture within the wood. The higher the temperature of the wood the more rapid is the rate of transmission of the moisture, and hence the rate at which the moisture may be evaporated safely. This, of course, applies only to temperatures below those which might result in injury to the wood.

Drying tends to render wood more or less brittle. Although the strength of wood increases with its degree of dryness, yet wood which has been dried and resoaked is less resilient than when green. Therefore, where strength is the prime consideration, it is preferable not to dry the wood beyond the degree at which it is to be used. The final stage of kiln-drying is generally conducted at a humidity somewhat below the actual humidity that on long exposure would produce the same average moisture condition. This is done in order to hasten the drying and to make it uniform throughout each piece.

St. Maurice Paper Company's Equipment

Much of the machinery and equipment of the various plants of the St. Maurice Paper Company, a reference to which was published in the Canada Lumberman of August 15, was furnished by the Waterous Engine Works Company, Ltd., Brantford, Ont. The St. Maurice Paper Company is one of the most extensive operators and manufacturers in Quebec Province. An idea of its size may be gathered from the following list, furnished by the Waterous Company, of some of the important machinery and equipment at the different plants:

Sawmill at Three Rivers—Power plant, consisting of boiler and twin engine, made by Waterous Engine Works Company; log haul-up, log deck machinery, double cutting band-mills, carriage, circular gang, etc., made by Waterous Engine Works Company; horizontal band-resaws, made by Giddings & Lewis. Pulpwood department—Log haul-up and seven-saw slasher, made by Waterous Engine Works Company; barking drums, made by William Hamilton Company, Peterboro, Ont.

Ground wood mill at Cap Madelaine—Six pulpwood grinders, made by Jencks Machine Company; nine pulpwood grinders, made by Waterous Engine Works Company; vertical Quiller screens, made by Waterous Engine Works Company; wet machines, made by Sherbrooke Machinery Company.

Sulphite and sulphate mill—Horizontal Quiller screens, made by Waterous Engine Works Company.

Sawmill at Charlemagne—Sawmill machinery, mostly by William Hamilton, Peterboro, Ont.

Sawmill at St. Gabriel de Brandon—Partly Waterous machinery.

Going Abroad for Canadian Ship Timbers

A despatch from Chicago states that the Edward Hines Lumber Company has received an order from the Canadian Government for timbers for ten wooden vessels, calling for 3,460.000 feet of Douglas fir. A large part of this order, it is stated, will be furnished from the Chicago yards, and six vessels have already been loaded from these yards. Some of the timber, however, will be shipped from the Pacific Coast and be rushed through with all possible speed by the railroads. The report also states that material for two vessels will be delivered in Toronto, four in Quebec, two at St. John, N.B., and two at Montreal. The smallest size called for is 10 by 12 in., and they range in size up to 36 in. by 36 in. by 60 ft. in length. The same company has also contracted to deliver timber for four vessels to a private concern in Canada. These vessels will use 1,600,000 feet of timber, and the order is being filled from stock in the Chicago yards.

When Do You Consider Lumber is Sold?

The Manufacturer's Interest in Stock After Delivery to Purchaser—Co-operation Important to Assist Retailer in the Fight Against Substitutes

Libby, the Chicago meat packer, made this statement: "I do not consider my goods sold until the tin cans are lying in the alley." In other words. he did not consider his goods sold until the consumer had eaten the product contained in the cans, and thus paved the way for further consumption. The mere fact that the retailer bought his goods carried no weight, because the full cans on the retailer's shelves were merely an obstacle to further business and increased output.

But you say: "What do we care about Libby and the grocer? There is a heap of difference between him and the man who sells our product." The reply to this is that the grocer does not sell individual lines. He sells general merchandise, competitive and otherwise. Therefore, the burden of selling falls upon the shoulders of the manufacturer of general merchandise.

"The retail lumber dealer, however," you will then say, "is established along an exclusive line, confining his efforts mainly to lumber, and thus in order to exist he must sell the lumber, whether we help him or not."

But we must say in answer that as a matter of fact, and because of the apathy of the lumber manufacturer, the retailer is gradually being forced to sell other lines, particularly substitute roofings, cement, and wall-boards. Why is he compelled to carry these lines?

The wooden shingle output has decreased 20 per cent. since 1904. Fifty per cent. of all roofings manufactured represent substitution. The increase in substitute roofings for 1904 to 1914 was 200 per cent., or a displacement of 1,500,000,000 feet of lumber. The present day cement output represents more than half the total lumber cut. Wall and plaster board have increased enormously since their introduction a few years ago.

Then you ask: "Why should we help the retailer, and why does the retailer desert us and sell substitutes for lumber " In the face of these figures you must admit that it is up to you to help the retailer to sell your product, especially when you consider that 75 per cent. of the substitutes for lumber has gone to materials costing more than lumber.

Some of you gentlemen who are willing to get in and meet this competition are thinking: "What can we do? What can we do, for instance, against brick? Brick is a fine product; it makes a very lasting and beautiful exterior for a home. If you would consult the advertising fraternity who make it their business to make merchandising analyses they would tell you that only 322,000 families out of 20,000,000 in the United States are receiving incomes of $4,000 a year, and that only 516,000 are receivng incomes of $3,000, and only 1,000,000 families are receiving incomes of $2,000. These, mind you, are not individuals, but families which have to be housed. And on the psychological side they would inform you that millions of people annualy write to the magazines about building information, which means that in the brain of nearly every man and woman is an inherent desire and craving to own a home. Real estate concerns, loan companies, and others have used this craving to advantage.

Now, isn't it logical to suppose that the large percentage of incomes mentioned above cannot afford a brick home, and very naturally will turn toward a home built of lumber? In fact, answering directly that question, "What can we do against brick?" you are not very materially concerned on this score, beecause, as shown by these figures, only a small percentage of American families can afford to be housed in brick. Nevertheless, even when brick exteriors are inevitable, as in congested city centres, you may look after your lumber interests for the interior, and nevertheless a very large number of expensive homes have been built in the past, and should in the future, with proper management, continue to be built wholly of lumber. You, therefore, have a definite market for your product, and you must especially bear in mind that new construction is going forfward in the United States at the rate of more than a billion dollars a year.

What You Have to Do

What you have to do is to create in the minds of the people a desire for your kind of lumber, namely. Western white pine. Don't advertise lumber; advertise the home or the barn or other structure built of the kind of lumber you sell. Libby does not sell meat; he sells tasty, delicious morsels of bacon or tongue, or salmon, fit for a king. You must not advertise lumber; you must advertise the "Home, Sweet Home," of Western white pine, with kitchen of dainty white enamel, and all the modern built-in features. You must advertise the modern barn, the silo, and the implement shed, built, of course, of Western white pine.

You must not sell lumber for planked streets, but wood paving blocks. You must dissociate the rough plank street, with its bumps, jars, and splinters, from the minds of the public. and replace this vision with the everlasting, silent pavement.

You must dissociate the tumble-down barn and the unsightly, box-like home from the minds of the farmer and the farmer's wife, and create in their minds the attractive, modern home, and the business-like prosperous barn.

But some of fthe more pessimistic of you will say: "All woods are beginning to compete, one against the other, through this advertising." Do not be alarmed at this. It is a healthy sign, which argues well for wood and ill for substitutes.

The first breakfast food was a commercial failure, though well and cleverly advertised, but it was not until half a dozen came into the market and advertised that the ready-made breakfast food became a popular habit.

Now, as to the farmer: Here is, indeed, a new market and a new field that will take care of most of your losses from substitutes. It seems almost necessary that certain classes of buildings. particularly in cities, be built of cement and brick, but not so in the farm field. The farmer has emerged from a state of struggle and penury to one of affluence and a rosy future.

A nail, a board. and a hammer visualized the building of the farmer to most of us. He was mortgage-ridden, ridiculed. He was the under dog. To-day he has wealth. He is able to do things as never perhaps before; and this is not altogether due to war conditions. Whatever the true underlying fundamental economic reasoning, the fact remains—the farmer is in a position to build and on a new and stupendous scale.

For years past the rural population has been decreasing and the city population increasing more and more. We must not too rashly assume that the farmer is top-dog because he has a huge customer in the city population. That city population must be rich also, else it could not buy from the farmer.* But the farmer has found himself; he has wealth, and that is important and enough for you. If you can also contemplate that the home-builder of the great city population also has wealth, why, all the better.

Modern Force of Advertising

But even when prices become lower the farmer is going to prosper and progress. Rural delivery is making him a reader, and therefore a student of economic conditions. The higher education of his children is bringing intelligence to bear upon his business methods. Some of the latest developments in farming show that co-operation is working wonders for the farmers, and they are adding to this co-operation the modern force of advertising. Witness, for instance, the orange and lemon growers of California, who market their product under a trade name, and use extensive advertising. Witness, the last few years, the apple growers of the Pacific Northwest, who, by co-operative efforts, are successfully marketing their apples through national advertising.

There is no doubt that to-day the farmer furnishes new food for thought in the marketing of Western white pine lumber. And what is the fact about the farmer of to-day? What is the first thing he does when he has a little surplus to spend? Does he not improve his home and his buildings? Every month the farmer's wife receives the Ladies' Home Journal or Mother's Magazine, or such like. and in that magazine are pictures and dscriptions of attractive homes. She wants one; she means to have one; she is dissatisfied with the tumble-down lean-to, the floor that gives, and the pots and pans hanging on the wall. Instead of this she wants attractive glass-covered pantries. She rebels and gets what she wants, and buys what she sees advertised. It is up to you to tell her what your product will make for her.

And Mr. Farmer: Doesn't he read every week his trade paper, the farm magazines? Doesn't he read the interesting articles about modern barns and conveniences, and doesn't he, if he has any money, do what you do—try to improve his factory and his plant? Hence the modern barns, milk houses, etc., that are springing up all over the country. Think of the untouched market you have in the development of the implement shed. The power of suggestion is so strong that if you Western white pine gentlemen begin to feature these structures of Western white pine in your territory you will get a lead on this business that will be difficult to overtake.

Now, you lumbermen of the West have been credited with great courage. It is said of you that you have gone into the mountains and the wilderness and have overcome physical obstacles in getting your product out to the consumer, but did you ever consider that it requires

*A paper by a prominent advertising man read before the Western Pine Manufacturers' Assoc'n

a far greater courage to meet competition and beat it than to go into the woods and drag out your lumber and handle lumberjacks?

Don't you think it required courage for the substitute roofing men to go against the wooden shingle, or the wallboard people to go against lath. Not only did it require courage, but it required imagination, which is one thing that only too many business men—some lumbermen included—lack. You lumbermen are the upper dogs; have been for years. It is the substitutes that are barking up your tree and are showing the courage of business conviction.

It would do some of you gentlemen good to spend a week with, say, a manufacturer of biscuits. Can you imagine the feelings of such a man who, after years of struggle, is confronted with his salesmen's reports showing that the big trust back East is flooding his market with demonstrators and making introductory offers and special deals that are taking thousands of dollars from his pockets and are compelling him to fight or quit? Such a man, if he has not established his good-will by judicious advertising, is in a bad plight.

"There are none so blind as those who will not see," but it is a fact that the advertising of safety razors has made the American the young-looking man. Advertising raised an army for Great Britain in the time of her greatest distress. Advertising has made the orange and lemon growers of California prosperous. Advertising has sold automobiles, and, according to Bradstreet's and Dun, non-advertising is directly responsible for 80 per cent. of the business failures.

Individually you cannot advertise to any appreciable extent or effect, but co-operatively you can advertise and sell your entire market for a minimum outlay.

You, gentlemen, like the orange growers and the apple growers; like the asphalt producer, and the cement maker, can advertise co-operatively, and thus by assessing yourselves a trifle create and establish a good-will that is without doubt the best investment you can possibly make. You are good manufacturers. Are you good salesmen? Why not be both? But don't advertise in the spirit of, "Well, I'm a good fellow; here goes." But, on the contrary, advertise knowing that it is sound, positively necessary business to do so.

A Word About the Trade Mark

Now, just a word about the trade mark. A trade mark is an essential of advertising because it represents a responsibility that the buyer can look up to. Now. if the responsibility for Western white pine is invested in the association safeguards for quality, goodness of manufacture and inspection, then these guarantees should be incorporated in your advertising and the trade mark used is an identification mark for this certain quality or specification.

When you do adopt a trade mark, don't exaggerate it. Remember always that it is attractive homes, practical barns, silos to keep ensilage sweet, built of Western white pine, fine finish and other mill lumber that you want to sell. Advertise first what your lumber will provide for these. That will gain your market's interest. Next tell them that lumber assures them certain definite qualities and that these qualities are identified by a trade mark.

A few words, too, should be said about your product. Western white pine lumber is a splendid wood. It possesses every qualification essential to a general building material to a very marked degree. Because it is soft and easily worked it is a splendid wood for factory and shop use. It is wood that takes paint beautifully, and therefore for interior paneling, cupboards, doors, etc., it is excellent material.

The present time is most auspicious for advertising Western white pine, and particularly if you are going to concentrate on the farm and the factory trade. It is not disadvantageous to begin at a time of least resistance. The prosperity of the country and the excellent condition of the building industry are interesting factors. To come out boldly in an advertising campaign will forever offset, too, the misinformation circulated that pine lumber is exhausted.

Another thing in you favor is that pine is backed by "grandfather's good-will." Everywhere you have a host of acquaintances who are doing the same things as their fathers and grandfathers did before them—namely, building of pine.

New building construction is going forth very rapidly indeed. Many of the dwellings now in existence will need improving, changing, and rebuilding in the near future. Much of this is within your territory. You will win if you have the courage and the conviction, and advertise for the consumer's good-will.

When is your lumber sold? Gentlemen, your lumber is sold when the attractive home is built; when the door is hung on its hinges; when the pantry has won the woman's heart; when the farmer points with pride to his barns; when the traffic runs over the silent pavement. In other words, your lumber is sold when you intelligently, persistently advertise your product to the ultimate consumer.

The keel of the first wooden steamer to be commenced at St. John, N.B., for the Imperial Munitions Board, was laid recently at the yards of Grant & Horne, at Courtenay Bay.

A New Issue of the Hardwood Consumers' Register

The National Hardwowod Lumber Association has issued Volume No. 6, second section, 1917 edition of their Consumers' Register. This volume is larger than any previous issue, and covers a much wider range of territory.

When Volume No. 5 of the Register was published at the beginning of the present year the announcement was made that the second section would appear in the fall, but owing to the unexpectedly heavy volume of requirements that have since been registered by the hardwood consuming trade, it was decided to get out Volume No. 6 at this time. Furthermore, it is possible that it will be found advisable to publish a third section of the 1917 edition before the end of the year, that depending entirely upon what trade conditions may obtain or develop in the meantime.

It will be noticed in the present volume that in addition to the manufacturers of furniture, agricultural implements. railway equipment, etc., who have all along co-operated so liberally in this work, there is a notable acquisition in the shape of the automobile manufacturers, and that a substantial percentage of the leading units of that industry have now been included.

Lumber Prices Comparatively Low

A tabulation of the prices of 96 leading commodities on August 1, 1914, July 1, 1916, and July 1, 1917, is given by R. W. Babson, the United States statistical specialist. The items covered include agricultural products, chemicals, building materials, iron and steel, petroleum products, etc. Mr. Babson's figures show that these 96 commodities have advanced an average of 55 per cent. in price since July 1, 1916, and 127 per cent. since August 1, 1914. In view of the fact that the lumbermen have generally claimed that their product has advanced less in price than many other commodities, and still remains one of the most easily obtainable, readily worked, and reasonably-priced materials, the following figures, taken from Mr. Babson's report, are of special interest:

	Advance in price Since July 1, 1916. Percent.	Advance in price Since Aug. 1, 1916. Percent.
Brick	26	80
Cement	27	34
Lime	8	102
Nails	60	158
Steel	123	390
Lumber	23	28
Average of 96 commodities	55	127

Aeroplane Spruce Specifications

John H. Wall, of the purchasing department of the Curtis Aeroplane Company, of Buffalo, N.Y., explains the wood requirements of the company, and of many other companies for which it purchases, as follows:

Spruce, which makes up the largest part of the airplane, must be 2 in. and thicker, 4 in. and wider, and we try if possible to get four side clear stock; but this is an impossibility in any large quantity. so we buy "G" list and, when possible, four sides clear. We buy this stock 8 ft. and longer, with a large percentage 18 ft. to 40 ft. long. This stock must also be vertical grained.

We use tough, straight grained, white ash, 6/4 and thicker, preferably 6/4, 12 ft. 4 in. to 16 ft. long.

We also use pine for the webs, and we buy the clear grade 6/4 and thicker. All of this stock is resawed into 1.2 in. D2S.

For our propellers we are using straight-grained mahogany, which must be 1 in. and thicker, 10 in. and wider, 9 ft. and longer, but there is some talk of changing the specifications on the propellers to either quartered oak or birch, due to the scarcity of mahogany suitable for this purpose.

Co-operative Lumber Advertising

Advertising in a co-operative manner is being actively carried on by the California Redwood Association, which has started the development of a "builders' library" of publications to show the advantages of redwood for various types of buildings. Among the first of the publications, which are all being illustrated with actual buildings of the types described, is one on the redwood homes. The redwoods were many of them sturdy saplings at the time of the birth of Christ, and grow nowhere else than on the Pacific California coast. They are said by scientists to be a relic of the prehistoric vegetation which flourished with the mammoths and the five-toed horses. Another volume is on specialty uses. such as refrigerator insulation, coffins, incubators, pipe organs, and the like. Another volume is on finishes of redwood, and still another on the use of redwood on the farm.

Laying Out a Retail Lumber Shed

Practical Arrangement of a New Firm's Plant so as to Facilitate Shipment and Storage of Stocks

The layout of a retail lumber company's shed is always a matter of interest to other lumbermen. At a glance an experienced dealer can get a good idea of a firm's business as he passes through its shed. A good layout, affording satisfactory storage and shipping facilities, is greatly to be desired by any retailer, and for this reason we reproduce an illustration of a model shed for housing a large stock. The shed in question is located in a United States town, where competition is keen and where modern methods have much to do with successful trade. The illustration and descriptions are reproduced from the American Lumberman.

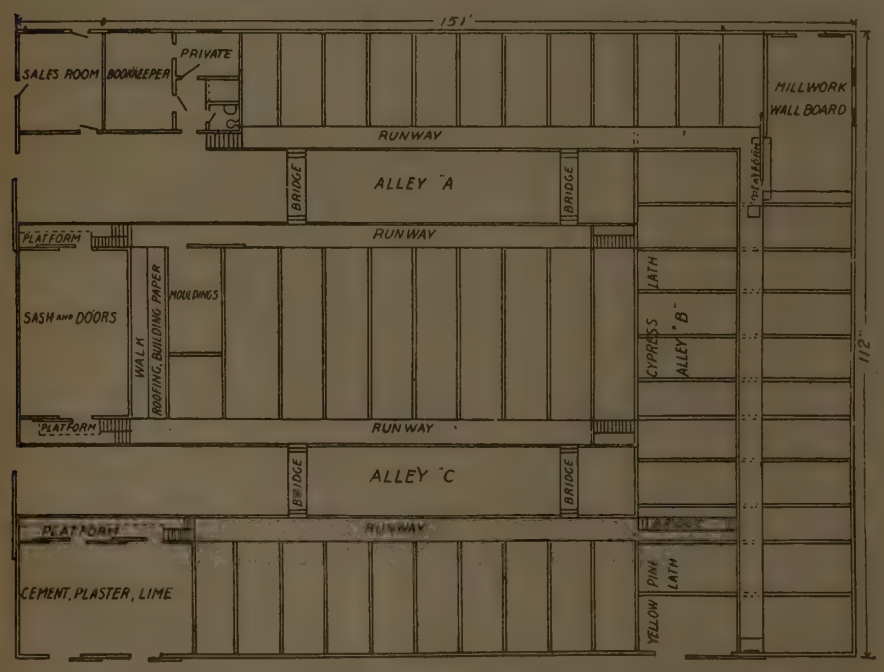
This new shed is a revelation in its completeness and ideal arrangement for the purpose for which it was intended. It is practical, and was designed and built for service without making the cost prohibitive or sacrificing appearances. It has been the intention to incorporate into this new plant all the good things observed in inspection and study of other sheds, and to add to these many of the owner's own useful and beneficial ideas.

The building is of wood construction. The outside measurements are 112 x 152 ft. The outside walls are 14 ft. high, and are covered with fir drop siding. The roof consists of yellow pine shiplap sheeting, covered with rubber roofing. Some idea of the size of this roof may be gained from the fact that it took 186 squares of roofing to cover it. The shed faces the street on the north; there are also a street on the east and a public alley on the west. The office is 18 x 28 feet, and is located in the northeast corner of the building; this is a large, airy room, with two large plate glass show windows and sufficient small windows for light and ventilation. Back of the office is a room 18 x 18 ft., designed as the service room, which will be fitted up with tables and chairs, samples of all kinds of merchandise sold by the firm, literature and advertsing matter, models, etc., and it will also answer the purpose of a rest room for the customers. The office and service room are finished with wall board, and this material shows to advantage for this purpose. There is a 7 ft. basement under the office and service room, and this will contain the heating plant, fuel room, storage and toilet.

The outside foundation is constructed of 8 in. building blocks on a 20 in. concrete base. The inside piers, which are 8 ft. apart each way, are constructed by placing 8 in. drain tile on 20 in. concrete bases and filling them with concrete, leaving the drain tile in place. This makes an excellent pier, and it is a big saving in form material and labor. Light and ventilation are secured from two rows of large windows in an offset in the roof and by ventilators in the outside walls just above the foundation.

The lot on which the shed stands varied from 1 to 5 ft. below the street level, and the soil secured from the basement was used for making the necessary fill and at the same time reduced the cost of this work.

The shed frame and all lumber supports are of 2 x 4 in. built-up construction, and the lower joist and all bearings are 2 x 6 in. built-up construction. The lumber bins are 8 ft. centres and the lower bins are 7 ft. high. The lumber bins back of the office are 17 ft. deep, as also are the bins in the rear of the shed. The bins on the west side are 21 ft. deep and the centre bins are 31 ft. deep. The driveway running entirely around the shed is 23 ft. wide. It is possible to load any of the contents of the shed by making one circuit of the driveway.



A model retail shed layout.

The receiving room for storing special stock is located in the east rear of the shed, and is 17 x 32 ft. This room has a door leading from the street on the east of the shed. The sash and door room, located between the driveways in the front of the shed, is 21 x 31 ft.; the ceiling of this room is 8½ ft. high, allowing plenty of space for handling doors without striking the ceiling. This room has two large windows opening into the street for light, and it is located on the north side of the building in order that its contents will not become damaged by reason of sun stain, which would be the case with any other exposure. The space above the sash and door room is floored, dust-proof, and is used for the storage of light material, such as screen doors, columns, glass, etc. The cement and plaster room is located in the west front of the shed, and is 21 x 32 ft. in size. This room is reached through doors from the inside driveways and also from the alley, making it possible to load and unload material from both sides. The space above the cement and plaster room is used for the storage of ladders, gutter, etc. Trap doors in the inside loading platform make this a handy and convenient place for the storage of empty sacks until they can be bundled. Back of the sash and door room in the centre of the shed and on a range with the manager's desk in the front office is an open passageway, which is used for the storage of ready roofing. This not only makes a convenient place for the roofing where it can be easily reached from either driveway, but it also gives the manager a commanding view of the opposite driveway without leaving his desk. The new shed has water connections in each driveway.

The upper loading platforms are 4 ft. wide. At present these are not protected by hand-rails; however, they have a 2 in. piece on the outer edge raised slightly above the level of the floor, which does away with the danger of the foot slipping. The objection to hand-rails is that they make the free handling of lumber impossible, which is not the case with the present arrangement. The upper decks are connected with foot-bridges, two in each driveway. These are raised to the proper height, so as not to interfere with free passageway underneath.

Opening into the alley in the west rear of the shed is a driveway, which can be used when needed to do away with crowding in the driveways. The floors in all warehouses are raised to the level of the floors of the wagon boxes or platform of the lumber trucks for convenience in loading and unloading material. The shed contains dust-proof bins enclosed with roller doors, for the storage of all finished stock, oak flooring, etc. Lath are piled in the driveway at the rear of the centre lumber bins and also in the driveway leading to the alley in the west rear. The mouldings are stored in dust-proof compartments and are laid flat.

This shed is so arranged as to take care of all the material carried by this firm, with the exception of the shingles and sewer pipe. To care for these items a storage yard 34 x 112 feet has been provided just across the street in front of the yard. This storage yard is in plain view of the office, and for this reason its location is ideal, and has many advantages over a yard located at the side or in the rear of the shed, as is so often the case. The problem of paving the driveways of this shed has as yet not been solved. The owner contemplates a paving of crushed rock covered with screenings. The one serious objection to the closed shed has always been the question of dust; and for this reason the treatment of the driveways of this new shed, with a view of eradicating the dust nuisance, will be watched with great interest by lumbermen.

Retail Yard Cost Comparisons

The cost of doing business in retail lumber yards, stated as percentages of the sales in these yards for the year 1916, is stated by the A. W. Shaw Company, of Chicago, to be as follows:

Indicated Costs of Doing Business Among Retail Lumber Yards (1916)

	Population of city or town.			
Items.	Under 5,000. Per cent.	5,000-50,000. Per cent.	50,000-100,000. Per cent.	Over 100,000. Per cent.
Salaries	5.20	4.37	4.00	4.94
Rent	.79	1.49	1.58	1.21
Handling stock	4.53	5.42	6.27	7.02
Advertising	.38	.34	1.05	.31
Heat and light	.10	.13	.27	.08
Supplies	.25	.29	1.10	.72
General expenses	1.22	1.37	.86	1.50
Insurance and taxes	.81	.92	.85	.91
Bad debts	.50	.74	.77	.75
Total costs	13.78	15.07	16.75	17.44

Farmer's Buying Power Strong To-day

That lumber is not high and that the same number of cattle, or hogs, or the same amount of wheat or other grain, will purchase much more lumber than it would in 1914, is a fact that the management of the Thompson Yards, Inc., with headquarters in Minneapoplis, is endeavoring to impress upon the managers of its several hundred yards in various parts of the country. In other words, this company wants its retail yard managers to remove from the minds of farmers and other prospective lumber purchasers, the impression that on account of the high price of lumber, building should be postponed. With this in view the company has just sent out to its various retail yard managers some convincing literature, and copies of advertisements.

The general instructions are as follows:

The statistics given are the average prices that were paid for the products mentioned during the years of 1914 and 1917. They were taken from official records on file in Minneapolis and are as accurate as we can average them.

The figures used in making up the comparisons are as follows: The average price of grain in 1914 was:

No. 1 Northern Wheat	$0.95 to $1.05
Barley	.40 to .50
Flax	1.30 to 1.50
Corn	.58 to .68
Hogs	6.75 to 7.25
Oats	.32 to .38
Rye	.72 to .78

In 1914 our cash price on lumber was as follows:

Shiplap, boards and dimensions, on 40c rate, per M.	$22.50
Shingles, per M.	3.15

The average price of grain in 1917 (first six months) was:

No. 1 Northern Wheat	$2.70 to $2.90
Barley	1.28 to 1.38
Flax	3.10 to 3.50
Corn	1.55 to 1.65
Hogs	14.74 to 15.25
Oats	.62 to .66
Rye	2.30 to 2.50

In 1917 our cash price on lumber No. 2 quality classification was:

Shiplap, boards and dimension on 40c fir rate, per M.	$34.50
Shingles, per M.	4.35

All local managers should familiarize themselves with the statistics shown. A few facts of this kind will boost your sales. There is a mistaken impression that lumber is "high." These figures prove that it isn't high. The farmer never will find a better time to build than now. There probably will never be another time in history when his products will buy so much lumber as they will right now. His purchasing power is represented by what he produces. What was $1.00 to him in 1914 is now $2.00 or $2.50. The same products purchase from two to two and one-half times as much now as they did then. "Dollar wheat" was a godsend! What of $2.50 wheat?

If lumber had advanced in proportion to the advance in farm products, Mr. Farmer would be paying from $55 to $70 per M. for common and could afford it. As it is, lumber is now only about $4 over list, and list represents the average normal value of lumber. In other words, lumber is really only about 15 per cent. above normal at the present time.

And so we say that the manager who imagines for a single, solitary moment that "lumber is high" and that it isn't a good time for Mr. Farmer to build must revise his opinion at once, when he knows the facts in the case as they really exist.

If you have any good farmer friends to whom you are anxious to "tip off something good," get them to build now! They will thank you many times in the future.

Story of a Long Headed Farmer and a Boneheaded Lumberman

By D. J. McManis

Once upon a time Farmer Bean took a notion into his cocoanut to build a barn. Now, this is an event that on the average occurs on the farm about once in twenty-five years. This farmer, being of a retiring disposition when it came to blowing his wad, reasoned thus:

"I'll have Plank & Co. figure this bill, then I'll take it over to Jimtown to Blink & Cut, then I'll have their competitor, Mr. Slash, figure on it. and I think by that time the bill will be cut down to where they won't make much off of this duck."

So first he had Plank & Co. name their figures. Now, that firm believed in having a reasonable profit, so they figured the bill regular, and it amounted to $380. Over to Jimtown he goes to Blink & Cut. Those gentlemen, knowing the bill had already been figured, felt they would have to keep up their good name and reputation by making a cut, so they placed their estimate at $362. "So much so good," said Farmer Bean. "I'll go over and see Lumberman Slash." Now. Slash always had his nerve with him when it came to figuring down, but never when it came to figuring up; so he cut the bill down to $340, with an additional 2 per cent. off for cash.

So in process of time Father Bean hauled his lumber out of Slash's yard, and, with great glee at his success in cutting down profits, built his barn.

Now, it came to pass subsequently that Lumberman Slash wanted to buy 500 bushels of corn, so he said within himself: "I'll just go up and see Farmer Bean, and I think I'll get back some of that profit I gave him on the barn bill. So he went up to Bean's, who had about 5,000 bushels of corn in his cribs..

"Good morning. Mr. Bean," said Lumberman Slash. "I want to buy 500 bushels of corn from you. I suppose you will shade the price a little; you know I let you have my profits on that lumber I sold you for the barn."

"Shade the price!" exclaimed Bean. "Not by a dang sight. The price now is 95 cents a bushel and chances are good for another raise. I'll let you have the 500 bushels for $500 cash."

"Won't you give me, please just give me, anyhow, 2 per cent. off for cash?" whined Slash.

"Not on your life!" yelled Bean. "I'm not going to give away my good profits."

"But I gave you my profits on the lumber I sold you," whined Slash.

"Young man," yelled Bean, "I want you to understand that your profits and my profits are two different things."

That night Lumberman Slash had a dream, and dreamed that his head had all turned to bone, and that everybody was pointing fingers at him and calling him "Bonehead! Bonehead." The next morning Slash hung the following sign up in his office:

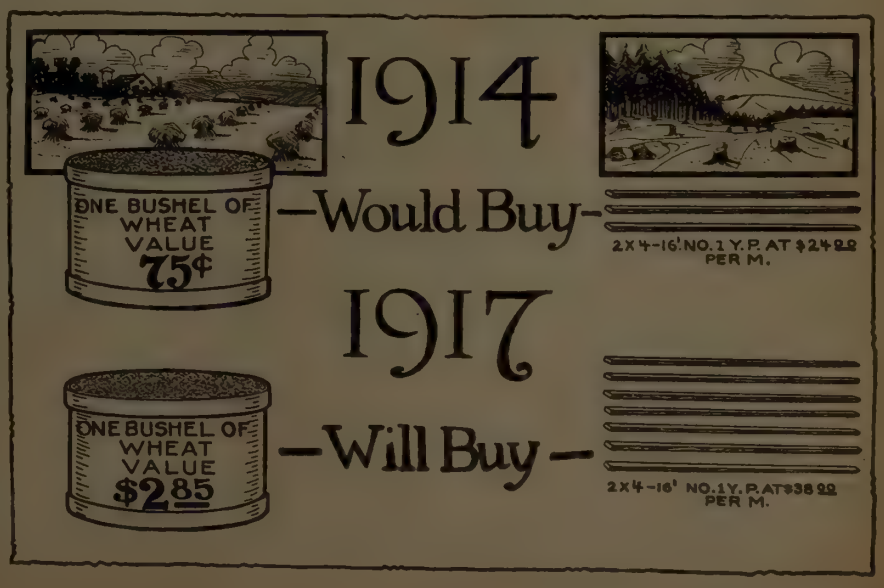
"The next man that gets me to cut below a legitimate profit on a bill of lumber will have the privilege of kicking me out of my own office."

Munitions Production in Canada to be Reduced

An Ottawa despatch of an evidently official nature states that the British Minister of Munitions has announced that munition production in Canada is to be reduced. The statement says that it is now unnecessary to continue production in Canada on the present scale, and that certain lines will be discontinued; other lines will be produced in lessened quantities, and some lines will be continued as at present.

The Farmer's Purchasing Power

A striking illustration of the fact that the farmer to-day is in a better position than ever before to spend money upon lumber for the erection of barns, silos, etc., is afforded by the accompanying illustration, which is reproduced from the Retail Lumberman. This is a Southern States publication, and its comparisons relate to the purchasing power of wheat as expressed in yellow pine boards. Comparatively speaking, the situation is practically similar in connection with Canadian lumber products. In 1914, with No. 1 yellow pine dismension selling at $24. which was the average retail price at that time, one bushel of wheat at 75 cents—the price at which wheat sold in August of that year—would buy three pieces 2 x 4/16. This fall, notwithstanding the fact that the average retail price of No. 1 yellow pine dimension in the country yards in the Kansas City territory has advanced to $38, one bushel of wheat at $2.85—the price it sold for the day this was written—will buy seven pieces of 2 x 4/16.



Ontario's Waste in Pulp Logging

By R. O. Sweezey

How long should a pulpwood log be? Naturally, the answer is that theoretically it should be of a length that will enable the operators to get as much as possible out of each tree. But there are other considerations which seem to prevent theory from squaring with practice. For instance, Quebec operators prefer 9 ft. to 12 ft. lengths, while Ontario operators cut 16 ft. logs. The reasons for this are discussed in the following article, the writer of which has had long experience in the business. Perhaps some of our readers can make a few good suggestions on this important question.—Editor.

Isn't it strange that those lumber and pulp companies which make most fuss about cutting stumps flush with the ground, using the saw instead of the axe for felling, rigidly adhere to their rule of cutting logs 16 ft. long? Herein may be found a waste much greater than in leaving a stump of convenient height in felling. The labor results of cutting trees flush with the ground, with two men operating the saw, fall considerably short of those from two men operating independently with the axe. It is a question of the saw versus the axe. The height of the stump, however, makes little difference. except that frequently the butt end of the tree is found to be rotten when cutting so near the ground.

The point to observe about the 16 ft. logs is that spruce will cut one to four logs per tree. In black spruce we usually get two or three logs in the mature trees, and where two logs are cut, probably over 50 per cent. of such trees would yield an additional 8 to 12 ft. down to 4 in. top; but, as the operating company wants only 16 ft. logs, the lumberjack has no choice but to leave the top to rot in the woods. The difficulty lies in the fact that the logs are too long. Multiples of 12 ft., say, would give three logs, equal to 36 ft., where only two 16 ft. logs can be cut. It is obvious that both in theory and practice the shorter the log the more complete will be the utilization of the tree.

The suggestion arises to cut both 16 ft. lengths and shorter lengths, say, 8 ft., for the tops. But this practice of having two standard lengths involves much inconvenience and added cost in making and skidding separately. For shanty operations logs should preferably all be of the same standard length, and that length is made to conform to the arrangement of saws at the slasher mill as well as being governed by the multiples of length required by grinders.

The 16 ft. logs find favor with the Ontario pulpwood cutters because it is of a convenient length for "snaking" and not too long for driving. It is also a good length for team loading. If the log were shorter the "snaking" operations would probably be slower for a given quantity, besides more saw cuts are necessary in cutting shorter logs. Therefore, in theory, the longer the log apparently the more efficient should the operations be. Owing to team loading and driving, however, there is necessarily a well-defined limit. and that limit is found to be about 16 ft.

Now, in the Province of Quebec (which boasts the best log-makers in the world), where streams are so plentiful that long hauling is rare, logging is done mostly by the single-horse method. One immediate result is that roads cost much less, and with small horses the jobber gets into corners where pulp logging by the Ontario system would be very costly. By reason of this single-horse system and narrow roads (aptly described by an Ontario operator as "cow-paths"), the jobber, equipped with his home-made sleighs of peculiar design, can and does make more logs and greater quantity in a given time than the Ontario log-maker. But he prefers the shorter logs; 9 to 12 ft. suit him best, because one man alone can handle these better than he can the 16 ft. logs, for which, if he must make them, he demands 50 cents a cord more. Thus the extra cutting necessary in logging the shorter lengths is more than offset in the handling. The question, then, is why should not all Ontario pulpwood operators adopt the shorter lengths and save the waste now occurring in tree-tops?

Few Fires in Northern Ontario

It is now a little over a year ago since the great forest fires occurred in New Ontario which destroyed great areas of timber and resulted in the loss of many lives. This year, according to reports received from the chief ranger of the Department of Lands, Forests, and Mines of the Province of Ontario, there have been no serious fires. This has been due to the improved forest protection arrangements and to an abundance of rainfall. Northern Ontario settlers have now finished taking in their harvest and are starting to cut more pulp than ever. Owing to the high prices obtained for wood, it is expected that the returns will be the highest on record.

The Logging Outlook in Canada

That the labor shortage and the high cost of equipment and supplies are likely to prove a serious handicap to logging operations now commencing, or being planned, is reported from all parts of Canada. Many letters to this effect are being received, and loggers are discussing the situation everywhere. the general belief being that the difficulties constitute almost a crisis. The matter does not permit of much discussion, being simply a recognized state of affairs, growing out of enlistments and the high wages obtainable in other industries. As an indication of the way in which logging operators look upon the situation in different parts of Canada we pubilsh three letters upon the subject, received from Quebec, Ontario, and British Columbia:

Labor Scarce in the Ottawa Valley

Editor Canada Lumberman:— Pembroke, Ont.

There is only one statement which it is possible to make at the present time regarding the industrial situation in connection with the lumber business. Labor is very scarce and all equipment and provisions are advancing in price every day. We think that the majority of lumbermen in this district will be taking out a normal cut during the coming winter, and the ultimate result will be a much increased cost, and consequently a necessity for much higher prices next spring when the output is for sale. All these conditions, of course, depend more or less upon the lumber market. It is not at all certain at present that sufficient labor will be available to take out a normal cut.—Pembroke Lumber Co., per A. L. Eastcott.

* * *

Quebec Logging Camps Short of Men

Editor Canada Lumberman:— East Angus, P.Q.

We are finding it very difficult to secure contractors for taking out the stocks of logs that will be necessary for the coming year. This is on account of the shortage of labor, and the high cost of provisions and equipment of all kinds. We expect to see the output of both labor and pulpwood materially reduced next year. Only a very limited quantity of pulpwood has been peeled in the woods this year, and, as a result, a large number of mills will put their logs into pulpwood instead of into sawn lumber. In the near future we anticipate very much higher prices.—Brompton Pulp & Paper Company, Limited, per J. A. Bothwell, Manager.

B. C. Camps Suffering from Labor Shortage

Editor Canada Lumberman:— Vancouver, B.C.

The chief feature in the industrial situation in British Columbia today is the unrest among laboring men. Strikes seem to be quite the order of the day, with the result that many of the shingle mills are closed down at present and the majority of those that are running are only operating to part of their capacity. There is a great scarcity of labor in the logging camps also, and many of these are only able to operate to part of their capacity. Men who will work are demanding very high wages. The high cost of labor, equipment and provisions is increasing greatly the cost of production, as compared with previous years. A change in the mental attitude of laboring men is very badly needed, for with so many men at the front and so many others engaged in the production of munitions, building of ships, etc., and much other labor in industries directly growing out of the war, every man should be willing to do his utmost to produce as much as possible and thus help the nation win the war. As conditions are at present, however, production will be greatly curtailed here this year in almost every line and the cost of what is produced will be very much higher than it should be.—Robert McNair Shingle Company.

The High Cost of Woods Labor

Those who are not closely in touch with the problems of the logging camp labor situation cannot form any idea of what operators have been going through lately. Every day has brought its wage increases and its increasing labor scarcity, until it has seemed almost impossible to go on any more. A letter written by one Pacific Coast lumber manufacturer to another, and given to the American Lumberman for publication, tells the story vividly.

"The matter of labor efficiency," the writer says, "is about the same with you as with us. One of the lumbermen here told me last week that his payroll this year for men at his mill, producing the same amount of lumber as last year, was just double what it was last year, due to the increased wages and the need of more men to do the same amount of work.

"We personally have advanced our wages twice this season on most of our men, and we thought that when we started up after the holiday we would probably get away without any further increases, but the logging manager has been up here for a couple of days looking after some men and talking with a good many of the old men on the river. He personally knows a large share of the loggers and has talked with a good many of them. He says that we have got to figure on an increase of from 25 cents to 50 cents a day all the way down the line when we start up to-day.

"We have already had some shots at it. Our locomotive engineer hit us for a raise from $4 to $4.75, which we gave him. Our head rigging man, who is a good man and one we want to keep, came in and said that he was offered $5. We were paying him $4.25. He preferred to go back to work for us, and we met the raise—paid him what he asked. There are other cases of the same nature. Hook-tenders are getting from $6 to $8. We have been paying our hook-tender $6.75. He will be in again and will probably want more money, especially when he knows that our head rigger gets $5. Seven dollars is good hook-tender wages and is about as much as most of them are paying, although the logging manager said that two of the hook-tenders he knew had been hired to go out at $8 per day.

"In addition to the increased wages we face a shortage. There were none too many men as it was, but they are in here for men for Southern Oregon, Eastern Oregon, Eastern Washington, and Idaho, and even California. We can't get much chance to 'pick.' You don't pick; you take—when you can. One thing that may help us is the fact that lots of the old-timers who have gone out of the country may come back in here when they hear the wages that are in force."

Maine Woodsmen Are Highly Paid

Munition factories are not the only places where big money is earned. In the State of Maine, for instance, first-class woodsmen who can cut two or more cords of pulpwood a day are receiving from $5 to $10 a day cutting by the cord for a big paper company, the Great Northern, which has put most of its pulpwood cutting on the piecework basis. Any first-class woodsman can cut two cords of pulpwood a day without exerting himself, and by exerting himself he can cut three or four; and this means $7.50 to $10 a day.

Wages in the woods this winter will be higher than ever before, ranging from $1.40 a day for main road swampers to $2.55 a day for A No. 1 cooks. This means that the lowest wage in the woods will be $36.40 a month and board, and the highest for men who are not bosses will be $72.50. Never in the history of the Maine woods have such wages been paid. Men of no great industry or ability can get jobs in the woods at the lower wages, as long as they are able to do anything at all.

The high wages paid to men cutting pulpwood has not been an unmixed blessing. The more pay woodsmen get, as a general rule, the less time they care to spend in the woods. It does not take a man earning $5 a day long to pile up $100 to his credit, and as soon as a man has that amount coming to him he begins to stir uneasily and loses ambition. Then comes a trip to Bangor or Boston to enjoy life for a brief time, spending his money, and back to the woods again.

The men who are paid by the cord for cutting pulpwood pay the company for their board, at 75 cents a day, but otherwise their working conditions are the same as if they were employed by the month. They have comfortable camp accommodations and plenty of the best food.

Prohibition and the Logger

Only a few short months ago the city rendezvous of the average logger in the Pacific Northwest was a short pace indeed from the corner saloon below the "line" in Portland or Seattle. A 25-cent room or even a 10-cent bed in vermin-infested lodging-house served him well enough in the days gone by. His accumulated pay checks, often untouched from Christmas to the Fourth of July, melted at the bar like the proverbial dew before the rising sun. Ten days to two weeks were often ample to reduce his roll to the last farthing.

The logger was easily "rolled" or "trimmed" out of the last remnant of his once tidy little sum by the leeches of the lower levels of society, were any left after John Barleycorn finished with him. A few days of such revelry usually sufficed to send him back to his camp with a bad taste in his mouth and a feeling of disgust.

With prohibition has come a new order of things. This year, on the second "dry" Fourth of July, we have observed the logger in the better class hotels up town, enjoying a room with a bath. He now dresses as well as his superintendent.

As for the prohibition question, we see nothing more to argue about.—The Timberman.

High Wages in the Lumber Camp

The quantity of logs scaled in British Columbia during the month of June was 128,285,354 feet, making the total for the half year 576,369,000 feet, as compared with 416,387,000 feet during the corresponding six months of 1916. Wages for woodsmen in British Columbia are very high, and the labor shortage is acute. Hook-tenders receive $5 to $6 per day and board; rigging-slingers, chokermen, and chasers get from $4 to $5; fallers get from $4 to $6, and skidroad men from $3.50 to $4.25 and are very scarce at that.

Liverpool and Manchester Stocks

The following report upon Liverpool and Manchester stocks for the month ending July 31st, is furnished by H. W. Lightburne & Co., Liverpool, Eng.:—

Spruce and Birch

Month Ending July 31st, 1917

Tacoma Fir Door Plant Destroyed by Fire

Terry & Gordon, wholesale lumber dealers, Confederation Life Building, Toronto, report that the plant of the Tacoma Fir Door Company, Tacoma, Washington, was recently destroyed by fire, the loss amounting to $150,000, and the insurance being $102,500. Messrs. Terry & Gordon handled this company's doors in Eastern Canada, and while they will be inconvenienced to some extent by the interruption in their deliveries, they state that the company hope to have the plant rebuilt quickly. They intend to put up a new plant as soon as machinery can be secured.

A FITTING REPRESENTATIVE

Ludington, Michigan.

Editor Canada Lumberman:

I have just finished a careful perusal of the annual number of the Canada Lumberman. Whoever is responsible for this issue is certainly to be congratulated. From the British lion on the front cover to the clothing ad. on the back cover this is certainly a splendid number. To compile an edition like this, consisting of 182 pages and cover, with the advertising shown here, is certainly some task. I want to congratulate you on the appearance of this edition. and say that I believe it is a fitting representative of the splendid lumber industry of Canada.—A. M. Johnston, Publicity Manager, Stearns Salt and Lumber Company.

WANTED & FOR SALE DEPARTMENT

PUBLISHER'S NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (14 agate lines make one inch.) $2.10 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisements must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

Wanted—Lumber

Basswood Wanted

No. 2 Common and Mill Cull. Winter cut preferred. Apply Firstbrook Brothers, Ltd., Toronto, Ont. 8-t.f.

For Sale—Lumber

For Sale—Lumber

200,000 ft. Cull 1 in. and 2 in. Hemlock.

S. L. PURDY,
Coehill, Ont.
17-18

For Sale

Can make prompt rail or boat delivery of from 3,000 to 5,000 pieces of Jack Pine Piling, from 40 ft. to 70 ft. long.

The New Ontario Timber & Trading Co.,
Sault Ste. Marie, Ont.
17-20

Lumber For Sale

300,000 ft. B.M. 1 x 4 and up Clear and No. 1 Spruce.

400,000 ft. B.M. 2 x 4 to 2 x 10 Spruce. Piled widths and lengths separate.

GEO. C. GOODFELLOW,
Montreal, Que.

For Sale
Logging Railroad Equipment

Five hundred tons relaying rails and fastenings, mostly 56 lb.

One Shay gear locomotive, 70 tons (coal, wood or oil burning).

One Shay geared locomotive, 40 tons.

Two steam log loaders (derricks).

One Raymond Gasoline Log Loader.

Forty flat cars, 60,000 lbs. capacity, with air brake equipment.

One Empire Logging Donkey Engine (from Vancouver). Unloads a half car of logs at one time. Very powerful.

And other material, all in first class condition. Located in Ontario. Delivery September to November, this year.

GEO. H. HOLT,
926 Manhattan Bldg.,
Chicago, Ill.
16-17

Wanted—Employment

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

WANTED POSITION as woods foreman or licensed log scaler. Best of references. Box 1105, Welland, Ont. 16-17

EXPERIENCED BAND SAWYER, double or single, right or left, open for position at once. Box 618, Canada Lumberman, Toronto, Ont. 17-17

EXPERIENCED BOOKKEEPER and Lumber Office man open for immediate position. Good references. Box 617, Canada Lumberman, Toronto Ont. 17-17

POSITION WANTED as band saw filer by a man who is capable of handling saws in a large mill and has 18 years experience and is steady. Box 617, Canada Lumberman, Toronto, Ont. 17-17

A PRACTICAL LUMBERMAN, forty years old, with twenty years' experience, is open for engagement June 1, 1917. Last ten years with very large Canadian firm as superintendent and sales manager. Best of references. Box 496, Canada Lumberman, Toronto, Ont. 2-18

WANTED POSITION as Band Saw Filer or mill superintendent, having 25 years' experience on band saws and mill wright. Will go anywhere for yearly position. Can furnish gilt edge reference. Age 46. Can speak English and French fluently. Box 609, Canada Lumberman, Toronto, Ont. 15-18

WOULD LIKE TO HEAR from some saw mill owner who needs the service of a competent and reliable mill man who has had twelve years' experience in manufacturing in up-to-date mills; also would be willing to invest some capital with good people. Box 613, Canada Lumberman, Toronto, Ont. 17-20

Wanted—Employees

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents.

WANTED MAN to take charge of Planing Mill. One who is capable of setting up machines, filing and grinding pattern knives. Address Drawer F., Sarnia, Ont. 13-t.f.

Business Chances

Sawmill For Sale

Complete Sawmill for sale, cheap and easy terms. Capacity 20,000 feet per day. Field Lumber Company, Limited, Field, Ont. 11-t.f.

Logging Contract

We are open to place contract with an experienced jobber to cut logs and wood during the coming fall and winter from a Lot in Belmont Township, Peterboro County. Full particulars on application to The Pearce Company, Limited, Marmora, Ont. 17-17

Saw Mill For Sale

Complete Sawmill with timber rights and freehold lands for sale, excellent shipping facilities. Mill situated County of Shefford, with a visible supply of soft wood and hardwood timber in the neighborhood for an extended life. Address P. O. Box 222, Waterloo, Quebec. 16-t.f.

For Sale

Section Land (500 Timbered), Store, Saw and Planing Mill equipped, Boarding House, Barn Stable, Poultry Houses. Price, if sold now, only $8,000. Sell Store or Mill separate, cheap. Address,

L. GARNETT,

Car Supply Improved in U. S.

Reports just received by the Railroads' War Board of the United States show that the rail roads of the country in their co-operative efforts to give to the country the greatest possible amount of freight service, have effected an extraordinary improvement in the freight car supply.

These reports show that the excess of unfilled car requisitions over idle cars, or what is ordinarily but inaccurately termed car shortage, was only one-fourth as great on August 1, 1917, as on May 1, 1917. The excess of unfilled car requisitions on May 1 was 148,627, on June 1 it was 106,649, on July 1 it was 77,682, and on August 1 it had been reduced to 33,776. This result has been accomplished at a time when the railroads are supplying from 15 to 20 per cent. more freight service, with the same number of cars, than was being given this time last year, for the railroads handled in July a tremendous increase in both government and commercial traffic. The movement of cantonment supplies alone occupied the full services of more than 30,000 cars. There was also an extraordinarily heavy demand for cars to transport food products as well as materials to and from munition factories.

According to a recent statement in Parliament by Sir Edward Kemp, Minister of Militia, a total of 10,170 men has been recruited for the four Canadian forestry battalions now overseas. Recruiting is still going on and the total number now enlisted for forestry work is approximately 15,000.

Valuable Water Power

and

162 Square Miles

of

Valuable

Timber Limits

For Sale by Public Auction

The limits are on the river, Mississippi Branch, a tributary of the Madawaska, and Water Power at Eganville, Ont., on the Bonnechere River. These will be offered for sale by Chas. M. Henderson & Co., Auctioneers, at their office, 128 King St. East, Toronto, Ont., on **October 30th, 1917, at 2 o'clock p.m.** The limits will be offered in three parcels, as follows:

Parcel No. 1—
Comprising parts of the Townships of Mayo, Carlow, and Raglan, license covers in all 65 square miles, a great portion of which is deeded or located lands.

Parcel No. 2—
Comprising two parts of the Township of Cashel in two licenses, covering 18½ square miles, well timbered.

Parcel No. 3—
Comprising parts of the Township of Ashby and Effingham, in all 78½ square miles, well timbered. This parcel also includes lots 29 and 30, Con. 10, Mayo, making 100 acres (more or less), on which is located a valuable water power, known as the Big Chute, situated five miles from the terminal of the Bessemer & Barrys Bay Railway.

All this country was cut over some years ago for the pine, of which there is considerable left, along with large quantities of Birch, Maple, Ash, Elm, Hemlock, Cedar, Spruce, Balsam, and Basswood, suitable for sawlogs, also pulp wood, railway ties, and large quantities of hardwoods for chemical purposes and a great growth of young pine.

These limits are close to the Central Ontario Railway, on the West, a branch line of which runs in the Childs Iron Mine in the Township of Mayo, from L'Mable Station. They are also easily accessable from Barrys Bay, on the Grand Trunk Railway.

The Sale will be subject to all conditions and regulations of the Department of Lands, Forests & Mines, affecting same. The licenses permit the cutting of all kinds of timber, except on deeded or located land.

The reason for selling is for the purpose of closing up an Estate.

Terms of sale regarding limits, 25 per cent. of purchase money down, 25 per cent. 1st of July, 1918, balance 1st of July, 1919, bearing interest at 6 per cent. per annum. A liberal discount can be arranged for cash. Transfer of license will be made on final payment, purchaser bearing cost of transfer.

There will also be offered for sale a valuable Water Power, with a cement dam, and the stone walls of a flour mill; the latter was burned in 1911. This is in the centre of a thriving village served by the C. P. R. and G. T. R., a good manufacturing site.

Terms for the Water Power: 25 per cent. cash on day of sale, balance can be arranged.

Any further information regarding these properties will be furnished by writing the undersigned.

The properties are offered for sale subject to a reserve bid.

Review of Current Trade Conditions

Ontario

Market conditions in Ontario during the month of August are always quiet, and during the present year they have been rather difficult to analyze. The retail lumber trade seems to feel that lumber prices now have reached their highest point. Some wholesalers are inclined to agree with them in this regard and a few who have discussed the matter with the Canada Lumberman recently express the conviction that high prices have had much to do with discouraging building operations during the present year. On the other hand, although the demand is limited in many localities, the general consumption seems to be sufficient to absorb available stocks. The extreme scarcity of labor and the usual crop of sawmill fires have curtailed the output to some extent.

Logging operations have not yet commenced to any extent. Men for work in the woods are very scarce and producers are now anticipating that logs will cost them at least $5 a thousand feet more during the coming winter than during last winter. Some operators believe that the increased cost will run from $5 to $7.

The demand, on the average, would be considered fairly good for the month of August, notwithstanding the quietness in the building trade. Lumber is not going into building operations extensively, but there is a good demand for war and other purposes from the United States. Probably the greatest demand for Ontario stocks today is from that quarter, and is largely for war purposes, such as the construction of steel plants and general manufacturing. Dealers at Tonawanda, N.Y., are taking large stocks of Canadian lumber and shipping them to the Eastern States. Philadelphia is also using a lot of Canadian stock. Most of the lumber entering this trade is white pine and spruce, and includes all grades from dead culls to deals.

A shortage of shingles is not considered unlikely during the coming fall, and this is expected by some wholesalers to be accompanied by a further advance in prices. The volume of shingle production in British Columbia today is small, on account of the strike among workers, and at present there seems to be no assurance that the strike will be settled in the near future.

In connection with Ontario lumber stocks the chief thing of interest is the fact that there are practically no available stocks on the market. The mills sold their lumber early in the year, but did not expect at that time to run out of stock. Many of them figured that they would have a little on hand to sell at advanced prices if the market continued to improve. In this hope they have been disappointed on account of the lumber scarcity, and fully ninety per cent. of the mills to which this situation applies are finding it difficult to produce sufficient to keep up with what they have sold.

A slight car shortage is reported at some points now, but the real car shortage which is expected in the fall has not yet commenced. The movement of grain will probably cause the commencement of an extensive shortage of cars, as it has in former years. There is a slight shortage of C. P. R. flat cars, as many of them have been turned into coal flats by putting boxes on them.

Lumber prices at Ottawa continue firm. The shell box situation is rather uncertain. No new contracts are being let, and manufacturers who are completing old ones are in a quandary about their future business. Unless the Munitions Board makes some announcement of a reassuring nature soon the situation will be discouraging. It is possible that United States shell box production may either take a lot of Canadian stock or, not being sufficient to furnish all the United States Government requires, may result in some contracts coming to Canada.

Eastern Canada

Nothing has developed in the Montreal or Quebec Province trade during the past fortnight that can be considered of special interest. The local trade is still quiet. The building situation is inactive, and the yard trade, as is natural in August, has been almost featureless. Low-grade thick stocks are plentiful, as they have been moving slowly all summer. The threatening car shortage is inducing retailers to open up a little more, and a moderate amount of buying from this source seems to be probable in the near future. The announcement of the British Minister of Munitions that shell contracts will not be so plentiful in Canada in future is considered as likely to slow up business to some extent, as stocks of lumber for shell boxes have been one of the most important features on the market for many months. It is not possible, however, to foresee developments in this connection, and the situation will not be clear till it is known definitely to what extent the munitions contracts are to be reduced. Trade with the United States is on a fairly large scale, and there is a moderate demand at Montreal for stocks from outside points. The commencement of the logging season is at hand, and there is still much uncertainty about the extent to which they will be carried on next winter, but previous experience leads to a belief that, in spite of high operating costs, there will be as large an output as possible. The percentage of pulpwood to sawlogs, however, will unquestionably show a large increase over former years.

The Eastern spruce market at Boston is somewhat stronger than a fortnight ago. A more general feeling of confidence is reported among manufacturers, and if any changes have developed they are expected to be upward rather than downward. The government has placed more orders for spruce dimension, and most large mills are engaged in this business. The call for house frames is quiet, but only a small number of mills are in a position to handle this business. Stronger prices are expected and a decreased cut next season, on account of the advancing cost of labor and supplies. Moreover, there is a prospect of steadily increasing requirements for government work. There has been increased enquiry of late for Eastern white pine on account of delays in shipments of Western and Northern pine. Hemlock prices at Boston are still advancing. Offerings are very light, and it is expected that the output of the mills this season will show a reduction. There is fair enquiry for hemlock plank, and quotations are higher. The shingle market at Boston is rather quiet, and some price concessions are reported. Uncertainty in regard to future supplies of red cedar shingles is helping to maintain the price of white cedars. Lath also are quiet. Spruce lath have sagged a good deal from their early summer values. Manufacturers' stocks are not heavy. and a little more activity would probably make the price advance.

United States

The intention of the United States to establish a rigid policy of price regulation in regard to a great many essential articles of trade is causing a good deal of uncertainty at present, as to future trade. Disorganization of business resulting from the selection of the national army is also slowing up industrial activity. An added feature of disturbance is the spread of labor unrest throughout the country. These, however, are about all the adverse features that are to be reported at present. The crop prospects, on the other hand, continue to improve, and farmers are expecting to receive far more for their products than ever before. The lumber industry cannot fail to benefit from this situation, as the farmer is one of its greatest customers.

The building situation continues to show that the entry of the country into the war has had an adverse effect in this line. The loss in permits during the month of July amounted to about seventeen per cent., not including New York City. For the entire country a loss of fifty per cent. is reported. In spite of this, however, the quantity of lumber being shipped and sold is far greater than normal at this time of year, and it is going to factories of a great many kinds. So far as the lumber industry is concerned the greatest trouble it has to face today is that of labor unrest arising out of the demand for an eight-hour day in the sawmills. The situation on the Pacific Coast is grave and manufacturers are anxiously waiting for the first indication of an announcement of government policy in the matter.

Shipments of Southern Pine continue on a large scale. Mills in the South are complaining of a car shortage for domestic orders. An increase in demand is reported for yard stock and some of the better grades are showing a tendency towards higher prices. Reports from 135 mills for the week ending August 10, showed shipments of 112,609,616 feet, orders booked 93,826,368 feet, and production 84,184,826 feet. Normal production is about 91,000,000 feet. Shipments are thus shown to have exceeded production by thirty-four per cent.

The spread of labor troubles to some districts is offset to a slight extent by reports from some Douglas fir mills which have been able to start up again. It is too early, however, to say whether this improvement will continue. Men returned from the salmon fishing fields and from harvests will soon be drifting to the coast and may relieve the labor situation. Inquiries for Douglas fir lumber are plentiful and many of them would result in orders if conditions were more satisfactory. Indications are now developing of a fair fall demand from agricultural districts. The output of ship timbers is very large. Sales are reported of Douglas fir timber for shipment to eastern Canadian ship builders. There is a fair supply of cars for Douglas fir shipment. Pacific Coast prices continue firm in all regards.

View of Mills in Sarnia.

BUY THE BEST

Retailers and woodworking establishments who like to get A1 NORWAY and WHITE PINE LUMBER always buy their stocks from us because we can ship them on quick notice. It pays to have the goods, but it pays better to "deliver" them.

We also make a specialty of heavy timbers cut to order any length up to 60 feet from Pine or B. C. Fir.

"Rush Orders Rushed"

Great Britain

Lumber stocks belonging to merchants and yard-keepers at London have been reduced so much of late that they now have almost nothing to offer, and anything in useful sizes for immediate use is quickly taken up. Much stock continues to move out on dock, and there is no sign of anything in the nature of accumulation. Prices continue to advance as stocks decrease, and it is still very difficult to obtain new stuff, even with the permission to import under certain conditions which has recently been granted.

According to the latest information from Liverpool, the Board of Trade has intimated that hardwoods from North America are to be placed on the same basis in regard to imports as softwoods, namely, that they may be imported in neutral sailing vessels or as deckloads on vessels controlled by the government. However, as has already been noted, this concession is not likely to develop anything extensive in the way of imports. There is nothing reported in the way of c.i.f. transactions in spruce deals. Prospects of private traders obtaining spruce are almost nil, as they cannot import it at a price which would leave them a profit above the prices of January 31, with 33 1/3 per cent. added. Under these conditions there is no object whatever in importers risking their money. The spot market at Liverpool is quiet, on account of scarcity of stocks. There is a good demand, which would make lively trading if stocks were available. Much the same conditions prevail in connection with pitch pine. There is no c.i.f. market for birch, and the spot market shows no change. The demand still continues strong, and available stocks are steadily diminishing, while the prospects of obtaining fresh supplies are very poor. The timber trade of Manchester is tied up in a similar manner to that of Liverpool. Many important dealers assert that the timber trade is on the edge of a precipice, and will soon come to grief unless the government relaxes its restrictions to a far greater extent than it has. There is plenty of enquiry, which would mean good business under other conditions. Builders are having a very difficult time in obtaining stocks that they require. At Glasgow timber trade conditions have been a little more active lately than usual. A fair enquiry is reported and a moderate amount of selling for shipbuilding and War Office requirements. Available stocks on the market are very short, and the volume of selling is, therefore, much restricted. Glasgow merchants agree with others that the concession in favor of deckloads from North America is of little value, and that if there is to be any appreciable importation from Canada this season more feasable shipping facilities will have to be granted without delay. The demand for airplane timbers is very strong, and some sales of clear spruce and walnut have been taking place at almost fabulous prices.

Market Correspondence

SPECIAL REPORTS ON CONDITIONS AT HOME AND ABROAD

Ottawa Market Report—Prices Continue Firm

Ottawa, August 27.—(Special to the Canada Lumberman.)—The Ottawa lumber market during the closing weeks of August showed little or no change in comparison with the two preceding weeks. Outside of the 10 per cent. advance announced by retailers during the latter part of July there has been little to report in the market by way of price changes. Some stocks have been increasing in price all along, and continue to do so.

The market is firm, and there is no tendency to lower prices. The outlook is toward still higher prices for the coming fall and winter. Considerable anxiety is being expressed by the heads of some of the local mills regarding the curtailing or total cessation of shell box manufacture in Canada. In some quarters doubt is being expressed as to whether or not the end of the shell box contracts has been reached. One large retailer, in the course of conversation with the representative of the Canada Lumberman, said that if the shell box contracts had come to an end the woodworking industry would receive a severe blow. "That (making shell boxes) has been all that has kept us going since the war began. There is no building to speak of. Without the shell box business there is not enough work to keep the plants busy." On the other hand, some manufacturers are not expressing much concern over this matter. What is troubling them is the labor situation and the outlook for getting out wood from the bush this winter. Nearly all the mills are having trouble with labor. The retailers who are manufacturing shell boxes claim that with the men getting higher wages the majority of them do not care to work as hard as formerly, except on piece work. Bushmen are scarce and hard to get at any price. The Booth interests are having a hard time, though John R. Booth is offering the highest market price for such labor. In the pulpwood industry a shortage has been predicted for this fall and winter.

The W. C. Edwards Company is one of the few firms which report labor as being "satisfactory so far." This applies to both the mill and woods operations. This company states that it has not yet estimated what amount of wood it will attempt to cut this winter. Its plant is working on shell boxes, and is also doing a considerable export business to the United States. Enquiries and orders with this firm are "satisfactory," considering existing conditions.

Stocks of dry lumber are growing leaner every day. There is a tendency toward careful buying now on the part of the retailer, and he is purchasing only what he requires for immediate operations. Retailers also report a smaller supply from the small mills in comparison with last year, and are looking to the larger mills to furnish them with such material as they are likely to require later on. This careful buying on the part of the retailer is attributed to the shell box outlook, which, to say the least, is considered none too promising. In the event of some of the plants having to close through shortage of contracts, they do not want to have large supplies of lumber on hand to carry over.

Jackson C. Booth reports that "we cannot tell where we are at under existing conditions." The export restrictions and the labor situation are the two chief factors of uncertainty. The high cost of supplies for bush operations is also having a strong effect upon the situation.

The green cut is beginning to move more plentifuly, though so far in volume it does not equal the proportions of last year.

With the manufacturer the labor situation is causing most concern. Some manufacturers state that while there may be a cessation of shell box contracts for the larger size shells, the manufacture of the boxes for the smaller shells up to 18-pounders may be carried on. No contracts are being let for any size of boxes, and the majority of the work is on old contracts.

There is a possibility that Canadian shell box manufacturers may secure American contracts if the factories in the United States are not capable of fulfilling all the requirements of the American Government. In any event, even if American manufacturers can supply the number of boxes required, a great amount of wood will be used, and the Canadian lumber market will benefit, directly or indirectly.

Montreal Markets—The Camp Outlook

Montreal, August 24.—(Special to the Canada Lumberman.)—In discussing the outlook for lumber, wholesalers express the opinion that prices will have a decided upward tendency. All indications point to a scarcity of labor, both for woods operations and for mill purposes. Shantymen, too, have demanded and are receiving an appreciable increase over the wages of last season, and prices of commodities for camp use show a further advance. All these causes make for heavier operating costs and for a very short cut. The higher expenditure will have to be met by an increase in the price of lumber, which would also be influenced by shortage in supply if the cut be as limited as is foreshadowed. Some of the larger manufacturers state that they look for a considerable diminution in the amount to be cut.

Trade is rather quiet. This is due to a falling off in the demand for box lumber, owing to the filling of a number of contracts, the slackness in building, and the usual summer dullness. Enquiries from the United States are also stated to have decreased, although business is still fairly good. Prices, however, all along the line remain very firm, with every appearance of keeping strong.

There are renewed complaints of car shortage, but a firm handling British Columbia stock states that the cars are coming through in good shape.

Shipments to the United Kingdom have increased slightly. The rates are $90 a standard, prepaid. Since the alteration in the system of payment, rates have been placed on a basis of Canadian currency instead of sterling. Lately a little pine has been shipped. The permission to carry deck loads is a dead letter. As was pointed out in our last issue, deck loads can only be carried when the vessel is loaded above the Plimsoll mark; but so great is the congestion of goods that vessels are loaded to the limit with ordinary cargo, and there is no chance for deck loads of lumber. A considerable quantity of stock for aeroplanes, from United States points, is being shipped through Montreal for the United Kingdom.

KLIM

WHERE MILK IS NEEDED

"Food must be conserved"

KLIM
SPELL IT BACKWARD
PURE SEPARATED MILK
IN POWDER FORM
FOR ALL COOKING
WHERE MILK IS NEEDED

Are You Practising Practical Economy in the Camp?

The whole world is facing a shortage of food—everyone must do all they can to economize and conserve the available food supply.

One practical way of eliminating all of the waste of one important food—milk—is by using KLIM in all cooking where milk is needed. Klim is the solids of separated and pasteurized milk reduced to powder form. KLIM does not freeze, spoil, sour or permit of any waste.

More economical than other forms of milk for cooking and general camp use.

WESTERN BRANCH—1642 Pandora St., Vancouver B.C. **EASTERN BRANCH—Hull, Quebec.**

James D. Lacey & Co. Broaden Their Field

The announcement that a New York office has been established by James D. Lacey & Co., timber land factors, Chicago, Ill., is of much interest to the lumber industry. We are pleased to publish herewith portraits of the Eastern manager, Mr. E. A. Sterling, who is in charge of the New York office, and Mr. C. A. Lyford, who has joined the company as its chief forest engineer. The firm of James D. Lacey & Co. have been enlarging their operations in a conservative but extensive manner ever since they commenced business. They now have an exceptionally complete knowledge of timber properties, operations, lumber markets, and forest conditions extending throughout the United States, parts of South America, Canada, and Mexico. In addition to this they have wide interests in timber and mills and conduct a large business in buying and selling high-class properties for clients who are seeking timber investments or operations. They have established, since 1880, an enviable reputation for unvarying honesty, timber knowledge, and fair dealing. which makes a "Lacey report" of great value. With their home office in Chicago, one branch in Seattle, and another in New York, the company now have complete facilities for the transaction of any kind of timber business.

Mr. Lyford's connection with the company puts at its disposal an engineer of the highest standing in forest work. He comes to the company from the firm of Clark & Lyford, Ltd., Vancouver, B.C., where he has had a wide range of activities, giving him a wealth of experience and knowledge in forest engineering work. Before going to the West Coast his work covered much of the pulp region of Eastern Canada. As an indication of the magnitude of the work which he has been carrying on, the firm of Clark & Lyford, Ltd., have made forest surveys of over 5,000 square miles, or over 3,200,000 acres, which include complete surveys, timber estimates, topographical maps and reports. Mr. Lyford was in direct personal charge of much of this work. frequently spending weeks and months in the forests in order that the surveys might be perfected on a high engineering basis. Mr. Lyford was instrumental in effecting an improvement in survey methods and putting timber estimating on pulpwood properties on a new, scientific basis. He has also been in charge of a British Columbia logging operation for some time, and has contributed to the development of one of the most efficient camps on the British Columbia Coast. In addition to all this, he was formerly connected with a hardwood logging operation in West Virginia, and previous to this was with the United States Forest Service on field work, which gave him experience in various parts of the United States. Mr. Lyford is a graduate of Cornell University, where he took the degree of forest engineer. In the Seattle office of James D. Lacey & Co. he will co-operate in field work and also participate in the selling of timber properties.

Mr. E. A. Sterling, the Eastern manager at the New York office, is best known to the lumber industry through his connection with the National Lumber Manufacturers' Association as manager of the trade extension department. He also obtained the degree of forest engineer from Cornell University, in 1902. For a short time he served as forester with the New York State Forest Commission. After leaving college he entered the United States Bureau of Forestry, in the service of which he traveled extensively in many parts of the States. He prepared and secured the passage of the first comprehensive forest law to be enacted in that state. In 1905 Mr. Sterling was appointed chief of the Division of Forest Extension in the Forest Service. In 1907 he became chief forester of the Pennsylvania Railroad, and was accordingly the first railroad forester in America. After five years of this work he opened an office in Philadelphia as consulting forest and timber engineer. He handled the publicity work of the Forest Products Federation, held in Chicago in 1915, which subsequently resulted in the creation of the Trade Extension Department of the National Lumber Manufacturers' Association, of which Mr. Sterling remained as manager.

The other members of the firm are James D. Lacey, Wood Beal, and Victor Thrane.

Knowledge the Source of Trade Success

By John T. Madden

In my opinion, the lumber industry will derive incalculable benefit if a strong, aggressive association initiates the movement for uniform systems of accounts and exchange of information. I regard this as one of the best mediums that you may employ for standardizing conditions in the industry. The ultimate selling price for the product will be determined, first by the prices at which wood substitutes equally serviceable for a given condition may be procured, and the price which the public can be educated to pay for lumber.

Having established accounting methods in the retail industry, as well as in the wholesale and manufacturing branch of the business, there must be a tendency to stabilize conditions. This stabilization will be brought about, first, through the elimination of reckless competition; and, second. by a fair division of the profits to be derived in the industry among all parties. By this I mean that the wholesaler will see to it that the retailer receives his goods at a price which will enable the latter to market the same and make a reasonable profit over all expenses and cost, and, in turn, the manufacturer must sell his products to the wholesaler at such a price as will enable the latter to realize his reasonable profit over the cost of doing business. The three great parties at interest will undoubtedly work more satisfactorily under these conditions for their mutual interests, and, in addition, by the right kind of publicity, the public will be educated to the point of allowing all parties to make a reasonable profit on their investment.

I have found that you can always depend upon the man in the street to give you a fair deal if you will meet him half way and lay your cards on the table face up. The best way for business men to overcome or avoid reactionary legislation and adverse court decisions is to play fair with the public. A few of the far-seeing, broad-principled, and intelligent business men are realizing that conditions are changing. At a convention of the leading men in a prominent industry about two months ago one of these far-seeing men addressed his colleagues in this strain:

"Gentlemen, conditions are changing, and we must change with them. The methods which we employed a generation ago cannot be used to-day. We must read right the signs of the time, and in future conduct our business operations in accordance with this change in public policy."

Hence, in the multitude of conflicting interests, you of the lumber industry must safeguard your interests in the proper way. Lobbying,

E. A. Sterling

C. A. Lyford

Camp Supplies

When you have a requisition for groceries for the Camp, always remember that this is where we come in good and strong. We have for many years paid close attention to this branch of our business, and aim to have continually on hand all kinds of goods which would be of interest to the buyer of groceries for the Camp.

Just now, when prices of everything are ruling high, we have a range of moderate priced goods which we feel sure would interest you, and solicit your enquiries for samples and quotations of any lines which you may be in need of.

combinations in restraint of trade, or any of the other favorite devices of the past for accomplishing your ends, worthy though they might be—must not be employed. Your only right to exist comes from the fact that you are rendering a service to the community; that you are rndering this service at the lowest cost and retaining for yourselves something which the public will never begrudge you—namely. a reasonable rate of return upon your invested capital.

From what little experience I have had in auditing the accounts of retail lumber dealers, I realize that many of them are not in an any too prosperous condition. I have in mind a dealer whose annual business approximates $500,000 a year and whose net profits, after paying himself a reasonable salary, do not amount to 6 per cent. on his invested capital. And I think that his case is typical of the retail industry.

One great source of loss in the past has been from bad debts. I recall another lumber dealer whose accounts I audited, and when looking over the ledger, preparatory to laying out the work, I found an account therein which I had never seen before in a lumber dealer's books. Upon investigating the account for the purpose of seeing what was in it, I found that it was this dealer's custom to transfer from his good customers' accounts to this specially named account all the bad and doubtful debts which he had. The amount was quite considerable, indicating that the policy of granting credit in this particular case must have been lax. However, the lumber dealer himself was somewhat of a wag, because he had named the account most appropriately—it was labeled "Graveyard"—there lay the dead ones; there lay the buried hopes of profits.

I have known of lumber dealers and other men in the building supply trade to grant credit to an individual who had just emerged from bankruptcy on the same terms as before. I know that it is difficult as a practical matter to handle the situation; I realize that your competitors will frequently grant credit if you will not; and I know, also, from men long in the trade that sometimes men who have failed in business, or who are poor credit in the early part of their business careers eventually become factors in the contracting business. I have in mind a very prominent name in the contracting line to-day, who could not secure five cents' worth of credit fifteen years ago from most of the dealers in the metropolitan district. His name to-day is a by-word in the contracting business. Perhaps some of you know him.

Losses from bad debts, of course, increase your cost. Until you adopt as an association a new credit policy, under which you shall insist that contractors shall have a sufficient amount of their own capital to protect you on credit sales; until you insist upon reasonably short terms of credit; until you insist on prompt and efficient collection methods; until you insist on charging and collecting interest on overdue accounts, just so long will you continue to lose profits through bad debts.

Comparatively few contractors keep scientific costs; many of them do not know how to estimate intelligently. There are also many who do not keep comparisons between estimates of costs and actual results. Until contractors reorganize their business methods and insist upon costs in their own line of work—until then you must insist on stricter terms of credit; in no other way will your percentage of bad debts be reduced.

Now, you can see how this question of costs touches all business men. The absence of proper cost methods in the contracting line is responsible for increased costs and loss in your own, and so it is throughout the vicious circle; for, after all, in the last analysis, we are all socially one great family, and loss, inefficiency, and bad business policies, react to the disadvantage of every member of the family.

Time will not permit me to deal exhaustively with the subject of reducing expenses, but merely to mention that one dealer whose accounts I am familiar with has reduced his delivery charges and expense by 50 per cent. as a result of an intensive study of deilvery conditions. If teamsters and draymen had any brains and could be relied upon to represent your best interests and work for them they wouldn't be teamsters and draymen. It is up to the employer to supply the stimulus which they lack; you must think for them; you must lay out their work for them, and if you do this in a scientific manner, verily your cup of profits will run over and less grog will be pushed over saloon bars and ultimately down the throats of your teamsters and draymen, and your drays and wagons will no longer decorate the landscape in front of the family entrance of some thirst emporium.

I cannot for the life of me remember the name of a single lumber dealer in my own home city of Newark. I know half a dozen coal dealers by name, because I see their advertising. As I ride down in the street cars I see extolled the relative merits of Lehigh, Scranton, and Wilkesbarre coals. Does the average layman or the man who contemplates building a house realize the actual percentage of the total cost of the structure that the lumber will make up? I do not believe so; you haven't educated him to know these things. Does the layman know the merits of the different kinds of lumber and the purposes for which they may be used? I for one do not.

I wish to drive home two or three thoughts. We hear a great deal to-day about industrial preparedness, and I believe myself that it is a very vital issue. Not that you may expect to receive, perhaps, competition in your own line from Europe, but any disadvantageous competition which other lines of business may encounter will react disadvantageously upon you. Many economists believe that it will be some time before European competition will be dangerous. and, as a reason for this, they point out the length of time that it will take to replace the capital wasted in the present struggle. There is one factor, however, which I do not think has received sufficient attention from economists, and that is this—conditions in Europe to-day have forced all of the belligerents to be extremely economical, and to practice saving to the "nth" degree. That which they have been accustomed to under the strain of necessity will be followed to some degree after the war is over. Even in ordinary times the European is more saving than we are, and after this period of enforced saving I believe that Europe will recover her capital losses through extraordinary saving much quicker than any of us anticipate.

To guide you then in your future business life you need to have that broad, fundamental knowledge of business without which you cannot hope to attain the highest measure of success. I recall the experience of a very prominent wholesaler in the Middle West in the beginning of 1914. Perhaps you remember January, 1914, when no one expected a European war, and most of our business men were painting the future in rosy-tinted hues. This wholesaler attended a banquet at which everyone was optimistic over future conditions, and at which it was predicted that higher prices would be realized for lumber than ever before. But this man had that broad basis that knowledge of fundamental business principles that every business man ought to have, and he did not agree with the optimism there expressed. He saw that the stocks of iron and copper were increasing; he had noticed bank clearings; he had followed the exchanges, the effects of exports and imports, and the condition of crops. And he said to himself: "I am a bear on general principles. I am going to sell everything I can at present prices." And so he went out in the market and he took contracts running for the rest of that year at prices varying from the present market price to $3 a thousand higher than the market price, because he found everybody else who had not made a study of these conditions bulling the market. Well, the European war broke out in August, and we all know the result. While. of course, that helped our far-seeing friend, yet we were, according to all the books, due for an economic depression in 1914. whether there was a European war or not. It was bound to come. So, I say, those of us who make a study of business conditions. who know how to read business barometers, who know costs, who know fundamentals, are bound to be successful.

Discussion of "Trade Ethics" in Mill Work Distribution

By L. C. Boyle

The fact that there is much discussion at the present time in the millwork industry over the vexed question of "trade ethics" prompts me to submit some observations.

First, a foreword of explanation:

For several years I have been more or less actively connected in a legal capacity with retail lumber association work. My interest has been somewhat more than professional, due to financial investment in retail operations. A a result, I have naturally absorbed much of the economics involved in the merchandising of lumber products.

In the last three years I have also had occasion to study the lumber problem from the manufacturer's angle. In this connection my work brought me in contact with the national survey made of lumber manufacture conducted by the Federal Trade Commission. It might be of interest to state that the commssion will shortly publish its findings. This document will be of classic interest to every branch of the industry. For, after all, it is but one industry from the stump to the consumer, and this whether the product takes the form of a two-by-four or a highly-fabricated column. The economic error that touches any of its processes finds its way into every branch of the industry.

More recently I have come in contact with the millwork phase of the general problem.

The purpose of ths article is to discuss, as one who stands on the sidelines, certain of the outstanding difficulties that inhere in the distribution of millwork.

As stated, conditions as you find them in any one branch of the general industry have their influence all along the line. Right now we have a runaway lumber manufacturers' market, with the result that millwork operators and retailers are vitally affected. The one in the purchase of his raw material for conversion purposes, the other in buying yard stock for local distribution.

The manufacturer is not actuated by selfish motives. Extraordinary and abnormal conditions exist in the producing end of the industry. Three or four years back present market conditions would

RIORDAN PULP AND PAPER CO., Montreal. Easy Bleaching Canadian Sulphite Pulp.
ST. LAWRENCE SULPHITE PULP COMPANY.

have been attributed to combination. The public mind was poisoned with the suspicion of a "lumber trust."

Due to a changed mental attitude on the part of government, the industry, through the mediums of the Federal Trade Commission and the Forest Service, has been constructively investigated. The purpose was to get at the facts, not to harass and find fault. The fog of suspicion, ignorance, and political humbuggery has been dispelled, and this as the result of an open-minded grasp of the true situation. It is now understood that a "lumber trust" is impossible, and this because of the spread of operations, the number of competing units 49,000 mills, and the industry's excess capacity.

The reason for the present market conditions is not far to seek. It is not due to combination or monopolistic tendencies on the part of the manufactuers. As I view the situation, the following are the prime factors involved:

1. The outstanding conditions as to car supply.
2. Materials directly and indirectly involved in war demands; also the labor problem.
3. The purchasing power of the dollar has decreased. This is manifest when relative exchange values are studied.

Sure it is that we may expect prices to go still higher. This especially during the war period. Demand will persist and labor supply become more and more difficult.

These are matters with which millwork interests and the retail class should be thoroughly familiar. Through knowledge of the fact a better understanding will be developed as to the true reason for current prices.

As the millwork operators and retail distributors must secure their supplies on an advancing market, it is of first importance that they should conduct their operations so as to meet this changed environment better.

Over and above every other consideration should we bend our efforts to educate the public as to the reason for existing conditions. No one is better situated to do this than the well-informed retail merchant. In comparing prices of the present with those of the past use the yard-stick of comparison in terms of farm products, cost of labor, and necessary supplies essential to conduct the business. Will a thousand feet of lumber buy as much wheat, corn, oats, hay, potatoes, labor. glass, cement, oil, etc., ad infinitum, now as one, two, or three years ago?*

By such means the fact is made manifest that, notwithstanding that lumber products have advanced, they have not advanced in percent as high as almost any other article of commerce.

Through the local press drive these data home.

Lumber has ever been the industrial goat. The fault lies with us. A house divided cannot stand.

If the manufacturing lumberman, the millwork distributor, and the retailer but understood each other's problem better, and were more disposed to use the Golden Rule. much that now causes eddies and cross-currents would disappear.

Actuated largely by a consideration of these general observations, I was prompted to submit some suggestions, and this fact I might help in bringing home to the retail, and millwork interests especially, the basic need of a more intimate understanding of each other's difficulties and thereby cultivate a spirit of mutual helpfulness. These two branches of this common industry can and should co-operate. Their interests are common, their economic hardships quite similar. On the one hand the sash and door operator, be he manufacturer or jobber, is confronted with co-operative buying schemes and the small local mill, whereas the retailer must contend with co-operative selling plans and the menace of mail order concerns, both branches the victims of secret price-making.

If the small mills multiply and become more vital factors; if co-operative buying schemes develop along substantial lines, or if line yards extend their present tendency to act as jobbers, then indeed must sash and door interests adopt some new method of distribution to meet these changed conditions, and any change that may be thus forced will, of necessity, disturb the now recognized trade rights of the retail merchant class. It is therefore not only to the interest of these two branches to recognize each other's legitimate rights, but, indeed, as I view the problem, community welfare is involved. Any movement that tends to undermine the stability of the rural merchant accentuates the already rising menace of urban growth. This latter suggestion draws a long bow. and the limits of this discussion will not permit extending the argument into the related field. Sure it is, however, that any change in our industrial and economic methods that makes inroads on the business of the so-called country merchant thereby obstructs community development in our rural life. Such result holds a more subtle menace to the future of our national life than those lurking monsters of the deep that now threaten the commerce of the seas. Courage, patience, and genius will find a way to thwart sea piracy, but youth needs light and action. The social element is essential to the young. Make shopkeepers of rural merchants —change the rich and thriving life of the country town to the dull decay of a deserted village, and more than ever will the rural youth of the land turn their faces to the throbbing centres of the already overcrowded cities. History is replete with the record of this folly. As I view the problem, any movement we inaugurate that will strengthen the hands of the retailer is in the right direction, and this because it relates to the public welfare. The obligations involved, however, are twofold—the retailer must do his bit. He cannot handicap and burden the wholesale distributor, playing one against the other in the fierce game of competition and at the same time expect sympathy and support. No, we must study the other fellow's problem and develop the spirit of living and let live.

As we say in the law, "from the time when the memory of man runneth not to the contrary," the retail lumber merchant has been the inspiration, builder, and sure foundation of rural growth. The ready-at-hand material for home-bulding, barn and stock shelter has been made possible through the thrift, energy, and patient courage of the retail lumberman. As modern life requirements have enlarged our needs, the lumber dealer has ever kept abreast of the times, and to-day the local yard is a veritable department assembling establishment for building material. Space will not permit of a review of the genesis and evolution of lumber merchandising. It is an indisputable fact, however, that the local lumber merchant has contributed immeasurably to the growth and prosperity of every rural community in America. Besides his contribution to community and agricultural development, he has and still furnishes the convenient, the economic, the logical and ready means of distributing the output of the mills, and this whether lumber proper or millwork operations.

In thus maintaining a local distributing agency he carries many burdens. In fat years, as well as lean ones, he contributes to the state, county, and community's tax budget. His overhead and interest charges are fixed factors. He is a constant element in the local labor market. When crops fail and money is scarce he carries on his books, and this without interest, many accounts.

These are but a few of the outstanding items that appear as debit obligations on the retailers' ledger. In addition to all this, he has ever assumed the position as the local representative for lumber products in his community. Precedent, habit, and custom are powerful elements in persuasion of personal right.

Because of this situation the local dealer frankly resents any invasion of his trade territory by the outsider. With fixed conviction in the justice of his cause, he condemns the manufacturer or jobber who, posing as a wholesaler, slips into his territory and takes some substantial order, thereby leaving the dealer the skimmed milk of the local trade.

The greater volume of lumber products is sold locally in wagon or less than wagon lots. It is not only impossible, but indeed economically out of the question, for the wholesaler to serve this trade. Further, when we consider that a substantial per cent. of these small lots sales are sold on credit, and necessarily so, we gather some impression of the vital service the dealer renders his community.

Likewise. the dealer contends that it is unfair, unethical, and contrary to sound business principles for the manufacturer who sells to the regular trade to sell also to mail order concerns. He feels that the mail order system is at war with yard distribution; that mail order methods are frequently unfair and deceptive, and if given support are calculated to bring confusion and ruin to legitimate business, and this with unhappy results to the economic, industrial, and social life of rural communities.

The mail order business is but a form of retailing. The assembling plant is located in some large city, where, by the way, the mail order concern, generally speaking, sells no lumber. In passing it might be interesting to consider and analyze the fact that if the claims of the mail order house were true, could the city retail yard survive? The city offers the largest possible field for lumber distribution, and, although

Two or more strands of Jeffrey Plain Chain spaced or apart make an excellent Carrier between Mill and Yard Storage.

Efficiency Methods

in the Saw Mill or Woodworking Plant call for Mechanical Handling of all kinds of Materials.

Greater Output—Increased Cost of Wages and Materials—and Labor Shortage are Conditions that must be met today.

The substitution of Labor Saving Equipments for the hand operations of the past are an absolute necessity.

Coil Chain Log Haul Up. Cast Steel or Semi-Steel Spur mounted upon a long link Welded Steel Chain.

JEFFREY CONVEYORS

For handling Logs, Lumber, Refuse, etc., have been a recognized Standard for nearly 40 years. Many of the largest Mills in Canada contain our equipment.

Send us a sketch showing what you want to handle, distances, etc., and we will gladly recommend the type of Jeffrey Conveyor best adapted to your requirements. Catalogs sent on request.

Wire Cable Conveyor handling Refuse at Woodworking Plant.

Handle Lumber for DISSTON SAWS made in Disston Mill

Portion of Apple Logs in the Disston yards ready to be sawn into boards from which saw handles will be made

Carload after carload of logs come into the Disston plant almost continuously to be made into handles for Disston Hand Saws and parts of other Disston Tools.

These logs are sawn into boards **in our own saw mill.**

Thus, not only are Disston mill saws constructed along scientifically correct lines, but they are constantly subject to practical test in the Disston plant.

Well made saws thoroughly tested are the saws for economy and satisfaction.

"Lion Brand" is carried by every leading wholesale hardware house in Canada

this market is at the doorstep of the mail order distributor, the city dealer is not to any appreciable degree confronted with this competition. City yards multiply in the very shadow of this marvelous opportunity to get cheap lumber. The scheme is to compete with the country merchant whose yard is located hundreds of miles away. Why? It is my opinion our old friend of circus fame, P. T. Barnum, gave the answer. When it is further consdiered that they require spot cash, one wonders how they do it. But we must remember that they do distribute interesting reading matter, and then the pictures have their appeal. Advertise!

The far-reaching and manifold ramifications of the problem for review prohibit extended discussion; to treat the subject so would require more space than the active business man could find time to cover. The method must be suggestive rather than analytical.

(To be continued.)

The History of Veneer Cutting

By John C. McCauslan
of Henry Disston & Sons, Philadelphia, Pa.

To look back fifty or more years in the making of a veneer and to compare methods obtaining in those days with to-day's practice of slicing with knives, would be as big a stretch of the imagination as to compare the cutting of boards by the old pitsaw with the modern bandsaw rig equipped with saws 10 in., 12 in. to 18 in. in width, operated at a speed of 8,000 to 10,000 super. feet per minute. Notwithstanding all the advances which have been made in knife machines for cutting veneers, so little change is found in the veneer sawing machine itself that it can be said with all safety to be practically the same machine to-day as it was fifty years ago. The factor of the skill of the sawyer back of the machine is still the prime element of successful cutting.

In this backward glance let us turn our eyes for a moment to old England, where we catch a glimpse of a veneer saw used in the earliest days of the art, the flange of which had a diameter of 10 ft. to 12 ft., weighing in itself some four or five tons. The rim of this flange required 100 segments to cover it, and all together it was a ponderous affair. To-day the veneer saw has a flange about 5 ft. diameter, to which a set of segments is applied, bringing the total diameter to 70 in. or 72 in.

The only changes marking the veneer sawing machine of fifty years ago are those found in some places from the old-wooden stay blocks with stay block screws which reached through holes in the stay block and screwed into the log or flitch to be sawed, thus securing it; whereas the machine of to-day is equipped either with iron stay blocks or with wooden stay blocks containing steel clamps running in steel clamp slides, thus eliminating the screws except for the heaviest flitches. This enables the operator to leave a very thin last board. Right here let me say that a veneer sawyer sets the teeth of his saw differently from sawyers in other lines, setting the teeth for clearance and twisting them at the same time to "polish" the veneer and bring out the figure.

In days gone by, when a man wanted veneers he bought a log, say, of rosewood, mahogany, walnut, or satinwood, as the case might be, and carried it to his favorite mill. In bargaining for the cutting, the owner of the log usually specified the sawyer who was to cut it for him, and then offered a prize of $5 or $10, or perhaps a silk hat or box of cigars, for nicely-cut veneers, with the dancing figure well preserved and, what was most important, the maximum number of veneers to the inch. The sawyer would then be particular to keep his saw sharp, and frequent filing of the teeth was necessary to polish the veneer and bring out the figure and prevent tearing of the fibre of the wood.

The sawing of veneers did not hold full sway long, for knife-cutting machines of the rotary type were used as early as 1846 by a Mr. Titus. and Felix A. Mulgrew, of New York, operated a rotary machine over forty-five years ago. There was also an experiment made by T. B. Wilson, who invented a machine and knife to cut fluted or corrugated veneers. The very earliest veneer slicing machine I was able to get any trace of was operated by means of a hand-lever, and cut veneers 1/16 in. thick, about 4 in. wide. To-day the mammoth slicer, with its draw cut, will make a veneer anywhere from 3/16 in. thick to 1/300 in. The latter, however, is hardly practical. One hundred and twenty veneers to the inch is termed as thin as practicable in the present-day methods.

In the consideration of the subject of sawing or cutting veneers the economic objection to the veneer saw is the loss of material in the form of sawdust equal to the thickness of the veneer. To this must be added the markings on the sawn veneer caused by the set of the teeth, necessitating a heavier veneer to permit the removal of these marks in producing a perfect surface. It is, therefore, evident that the only particular advantage of sawing veneers is in cases where the character of the wood requires its being cut on the quarter or where a veneer is required to be used in places exposed to the weather—like the outside of storm doors or front door vestibules—the sawn veneer having a decided advantage over the cut veneer for these purposes. It will

thus be seen that the development of cutting veneers with a knife has still a long way to progress before the sawn veneer is utterly driven from the market.

So in looking backward to the days when rosewood was the proper wood to use in making pianos, this wood gaining its name from the odor of the wood, down through the cutting of satinwood, which, like all yellow woods, was extremely poisonous to the sawyers, often incapacitating for a time the men who cut it; the cutting of walnut, which now seems to be returning to popular favor; amaranth, a reddish wood from South America; sabieu, a wood like mahogany, coming from the West Indies; prima vera, a white mahogany from the western coast of Mexico; to the present day, we find veneers cut from almost any kind of wood, vast quantities of poplar and gum being cut profitably. We look back over the limited capacity of the veneer sawyer of fifty years ago who could cut a maximum of 1,700 super. feet of oak veneers in an hour, to the present-day slicing machine which can produce 100,000 super. feet of splendid mahogany veneers in a day.

Just an Illustration

The dealer who is adding just so many dollars per thousand to cost for handling lumber, without figuring percentage, is making a grave mistake. Five dollars per thousand added to cost may have been 20 per cent. at one time, and if the cost of doing business was 15 per cent. would have left you 5 per cent. net, but not so today. Five dollars added to present cost would, let us say, figure 14 per cent. Your cost of doing business has increased say 3 per cent. On this basis you would be losing at the rate of 4 per cent. Are you doing this? Better do some figuring on the proposition of costs.

Revised West Coast Grading Rules

The West Coast Lumbermen's Association, Seattle, Wash., have published a revision of their standard specification grading and dressing rules covering Douglas fir car material. This is the result of the work of a specal committee appointed to revise the rules for the grading of car material so as to conform with changes made in the standard rules of January 1, 1917. Supplies of the car rules may be had at 10 cents per copy.

A Good Advertising Device

Several of the members of a large retail lumber dealers' association are using a clever little advertising device which has produced results. A folded but unsealed envelope is printed on the inside as an order blank, space being given for signature. On the flaps are itemized the lines of lumber and building supplies carried by the firm. The address of the firm is given on the face side. One may fill out an order, fold up the envelope, and mail it in a few seconds. These envelopes are sent out to the trade with all advertising matter.

Ottawa Forest River Protective Association

Government sanction has been given for changing the name of the Lower Ottawa Forest Protective Association, which will now be known as the Ottawa River Forest Protective Association. Additional powers are also granted extending the territory on which a fire protective system may be maintained. This territory lies to the west of the original land, is bounded on the south and west by the Ottawa River and the interprovincial boundary between Ontario and Quebec, and extends in a northerly direction as far as the association deems desirable. The expense of fire-fighting in the Grand Lake Victoria division is to be borne by the timber lands in that territory alone.

B. C.'s Pulp Making Industry

During 1916, 65,000 tons of paper and 15,000 tons of pulp were turned out by the mills in British Columbia, and the only problem is the obtaining of markets. Some sixteen years ago the government commenced granting twenty-one-year leases in order to encourage the paper-making industry, with an annual rent of 2 cents per cord of wood cut. The lessees were bound to build and operate a paper mill of specified capacity. Four companies availed themselves of the provision, and three of these have passed from the hands of the original owners, but all plants are now busy.

THE LEADING TRADE JOURNAL

The "Canada Lumberman" for August, the "Annual Number," is a splendid edition, of nearly 200 pages. Its editorial and news columns contain valuable suggestions and real information, while its advertising pages are genuine works of art. The "Canada Lumberman" easily takes the lead among our trade journals.—Algoma Advocate.

EDGINGS

Ontario

The Seaman Kent Company, Limited, 263 Wallace Avenue, Toronto, have had plans drawn for an addition to their office at a cost of $2,000.

The Toronto Shipbuilding Company, Limited, have commenced work upon the erection of a mill and mould loft at the foot of Cherry Street, Toronto, at a cost of $10,000.

The planing mill belonging to Augustine and Son, Port Colborne, Ont., was recently damaged by fire, the loss amounting to about $10,000. Insurance was carried to the extent of $1,000. A quantity of machinery was included in the loss.

A new Dominion charter of incorporation has been granted to the McAuliffe-Davis Lumber Company, Ottawa, Ont. The authorized capital is $300,000. Among those interested are Mayno Davis, George Kelley, Allan Fraser, Redmond Code. The new company will take over the old company of the same name.

The Port Arthur Pulp and Paper Company, Port Arthur, Ont., are making rapid progress in the construction of their new pulp mill. The authorized capital of the company is stated to be $3,000,000. The plant now under construction will be one unit of three that will finally be built, and this one unit will have a capacity of sixty tons per day.

The directors of the Lake Superior Corporation are considering a plan for the development of their timber properties represented by approximately 3,000,000 acres of woodland along the lines of the Algoma Central and the Algoma Eastern railroads. The plan would provide for the construction of pulp mills at points convenient for shipment along these railroad lines.

W. L. and J. C. Hunter, Pembroke, Ont., whose operations were referred to in the Canada Lumberman of August 15, are owners of 50,000 acres of pulpwood in Ontario and Quebec, near Klocks Mills. They are taking out spruce and balsam pulpwood, and white and red pine logs this year. They are also installing a small sawmill on the Klock limits, and two barkers to peel pulpwood.

Reports from Philadelphia corroborate the recent statement that the International Paper Company will erect a pulpwood plant at Sault Ste. Marie, Ont., and that the product will be shipped to paper mills operated by the company in the United States. The same company is understood to be planning for the erection of a large paper plant somewhere in the province of Quebec. They will pay $250,000 for 100 acres of land adjoining the Lake Superior Corporation's Algoma steel plant at Sault Ste. Marie, Ont.

The Beaver Board Companies, with headquarters in Buffalo, have purchased the assets of the Abitibi Timber Company, Limited, on the Frederickhouse and Buskegow rivers in northern Ontario, comprising an area of 180 acres. William F. McGlashen, president of the company, reports that the holdings of the Timber Company have been transferred to the Beaver Abitibi Timber Company, Limited. The Abitibi holdings, which were recently acquired from the government, comprise some of the best virgin timber in Canada, and are well located for economical woods operations. The new company will at once open timber camps, construct a rossing plant and start a new station at the junction of Frederickhouse River and the National Transcontinental Railroad. The station will be known as Beaver Board Woods. The station will be equipped with a sawmill to prepare and ship lumber for the company's export trade and the manufacture of commercial lumber for the market. The company will also work 16 square miles of large spruce, which is especially adaptable for the construction of aeroplanes.

Eastern Canada

The firm of Dupuy & Cousineau, lumber and grain dealers, St. Lambert, P.Q., has been dissolved.

The assets of the firm of Paradis & Dion, lumber manufacturers, St. Roche, L'Achigan, P.Q., have been disposed of by sale.

H. T. Warne, Digby, N.S., is considering plans for the erection of a sawmill and box factory. He is asking the town council for exemption from taxes and for free water.

The Quebec Charcoal Company, Limited, has been incorporated to engage in the destructive distillation of wood. The incorporators include A. Wainwright, C. G. Ogden and G. V. Cousins, of Montreal, P.Q. The capital stock is $50,000, and the head office is at Montreal.

The New Brunswick Lumber Company, of Augusta, Maine, has been granted an extra provincial license to carry on business in New Brunswick.

The Three Rivers Box Company, who are putting up a $60,000 box factory at Three Rivers, P.Q., are in the market for lathes for turning open candy and butter tubs. The plant which the company are putting up con-

sists of two sheds, 1½ storeys high, 150 by 70 feet, and one sawmill 1½ storeys high, 100 by 40 feet. The manager is M. N. Gilbert, D'Israeli, P.Q.

The South Shore Lumber Company has secured supplementary letters patent in the province of Quebec, to increase its capital stock from $25,000 to $65,000.

The Bellerive Towing Company has been incorporated with head office at Three Rivers, P.Q., and capital stock of $20,000, to engage in transportation and towing. Among those interested are Hugh MacKay, E. Grenfell, G. W. Rowell, and G. P. Kingan, of Montreal.

The large pulp mill which is being erected at Edmundston, N.B., for the Fraser Company, is expected to be completed by next March. Something like two million dollars is being expended on the scheme, part of which comprises model dwellings for the workmen. Four hundred men are now at work on the plant, and good progress is being made.

Western Canada

Alford's Planing Mills, Saskatoon, Sask., were recently damaged by fire.

Seguin and Paradis, lumber dealers, Shortoaks, Sask., have dissolved partnership.

Crawford & Company, lumbermen, Pipestone, Man., recently suffered a loss by fire.

The Highland Shingle Mills, Limited, have been incorporated, with head office at Burnaby, B.C.

The Swift Creek Lumber Company, Limited, has been incorporated, with capital stock of $20,000, and head office at Fernie, B.C.

Doran Bros. & Son's sawmill at Deer Lake, near Vancouver, B.C., was recently burned, with a loss of about $2,000. Insurance was small.

The Vernon Lumber Company, Limited, has been incorporated with capital stock of ten thousand dollars, and head office at Vernon, B.C.

The B. C. Fir & Cedar Company recently had its two dry kilns burned along with 200,000 feet of clear cedar and fir. The loss will be about $20,000. The insurance does not cover the amount fully.

The Kootenay Shingle Mill Company, whose plant at Salmo, B.C., was burned out several weeks ago, is rebuilding. The company has a large gang of men engaged in the work. The mill had a capacity of 200,000 shingles a day.

Liverpool Market Report

Smith & Tyrer, Ltd., Liverpool, Eng., in their monthly market report for July say: Owing to the difficulties surrounding importation and to the government restrictions, trading is now limited to a very small compass, unless we take into consideration government direct operations. Certain modifications of existing government regulations have been granted, but they are not of much use. Pitch pine is reduced to a nominal stock, with no prospects in view of any appreciable supply. Spruce deals.—The relaxation of the regulations with respect to chartering tonnage has come too late to be effective, consequently the outlook for any importation of importance is very gloomy. Birch cannot be shipped under present conditions. Pacific Coast woods are now still more under government control, and business is extremely difficult.

Thessalon's Natural Advantages

The Algoma Advocate, of Thessalon, Ont., in a recent issue, says: "With unlimited supplies of spruce pulpwood north of us; with water-power from the Mississauga sufficient to run great factories, railways, etc.; with deep-water harbor at Thessalon furnishing shipping connection with all the great lakes, Thessalon should be a most desirable site for a paper mill or other big manufacturing concern needing just such natural resources and facilities. A number of people from the United States interested in this sort of enterprise have visited this north country recently, and have gone away full of enthusiasm."

The Department of Lands, Forests, and Mines of the Ontario Government has erected in the forest region of the North fifty observation towers, on each of which a watchman is constantly stationed in order to keep a lookout for fires. The towers are steel structures, about 60 feet in height, and are built on the high elevations of land. So far this season no bush fires of any consequence have been reported to the department.

Heavy rains in New Brunswick recently caused temporary shutdowns at a number of mills, among them being the Fraser mill at Fredericton and the Babbitt mill at Devon.

Up to August 8, 14,500 cars of lumber had been shipped for cantonment construction in the United States by the emergency bureaus co-operating with the Lumber Committee of the Council of National Defence.

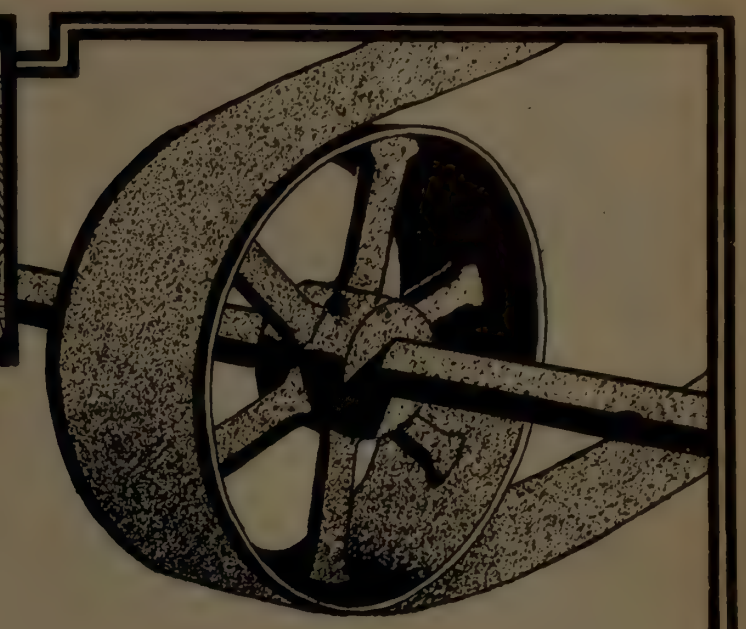
GOODHUE BELTS



"Acme Waterproof" Leather Belting

This brand is especially well suited to the wet places in a saw or pulp mill and will run true as long as it is in service. When you are overhauling your mill equip it with "Goodhue Belts" and you will never regret it. They are honestly made of solid leather—every inch a good belt and they won't stretch.

THE MOST OF THE BEST FOR THE LEAST

DON'T STINT "THE BOYS" BUT BUY THEIR FOOD CLOSELY

MINCE MEAT
JAMS and JELLIES
BUTTER
EGGS
EGG PRODUCTS
CHEESE
RAISINS
CURRANTS

BESIDES being manufacturers ourselves, we buy from the leading markets of the World and can consequently offer you a range that, in quality and price, few houses in Canada can equal.

While you, of course, cannot afford to stint your men, you have got to watch your costs. You have to buy from that house which can give you the greatest possible value for the least money expended.

In this regard we can be of mighty valuable assistance to you. Write us.

YOU NEED "LITTLE DAVID"
FOR WOODEN SHIPBUILDING
— MORE WORK AND LESS WORRY —

The "Little David" Wood Borer is the "Shipbuilders' Wood Boring Machine," because it is light, powerful and speedy, and above all, simple and durable.

It is made in three sizes, the smallest boring holes in wood 1" diameter and under, and the largest, 4" diameter and under.

All sizes are reversible, and the cases are of aluminum with steel bushed cylinders. This explains why the largest size is about ten pounds lighter than any other wood borer of equal capacity.

We have other labor-savers for wooden ship work, such as the CC-101 Drift Bolt Driver, Pneumatic Hammers adapted for trenail driving, and Pneumatic Tools for horsing oakum, etc.

Our nearest branch will be glad to give you full information, and to send bulletins, etc., at any time.

CANADIAN INGERSOLL-RAND CO., Limited

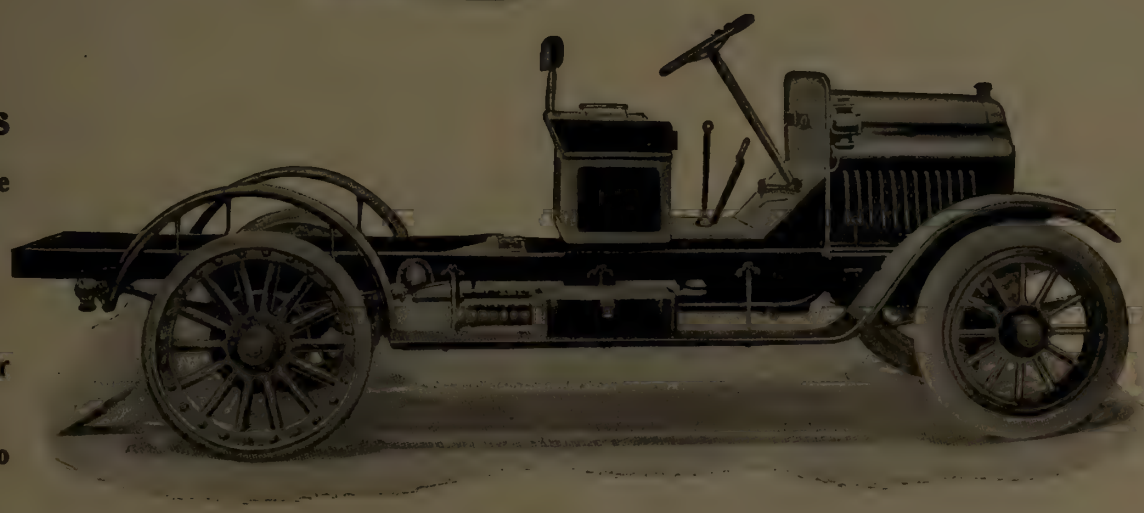
The "Little Giant" Truck

Special Features

Timken Worm Drive
Continental Motor
Schebler Carburetor
Ross Irreversible Steering Gear
Eisemann High Tension Magneto



Standard Models

"H 4"—1½ tons Chain Drive
"15"—1 ton Worm Drive
"16"—2 tons Worm Drive
"17"—3½ tons Worm Drive
"18"—5 tons Worm or Chain Drive to order

Model 15—1 Ton

THE LITTLE GIANT MOTOR TRUCK enables the retail lumber dealer to give his customers the very best of service, which is the big outstanding argument that interests the busy contractor. Other things being equal, the lumber dealer who can give the best service gets the most business.

The DUNTLEY Hydro-Pneumatic Gas Generator

THE DUNTLEY Hydro-Pneumatic Gas Generator is an exclusive feature of Little Giant Motor Trucks. With this device the Little Giant Truck may be operated on a mixture of one-half kerosene and one-half gasoline, at a saving in fuel cost of over 50 per cent., with a total absence of carbon, smoke or odor.

Eastern Spruce
Hemlock
Pine
Shingles and Lath

Shipment by car, canal boat or cargo.

Owing to constantly increasing sales we are anxious to establish new connections with Eastern Spruce mills, for shipment by car to Boston and New York markets, or by canal boat from Quebec to New York.

We also desire more connections with manufacturers of British Columbia red cedar shingles and cedar siding.

We will buy outright or sell on a 5 per cent. commission.

Douglas Fir
Red Cedar Shingles
Hard Pine
Maple Floors

We manufacture Spruce at our own Mills at Portage, Maine, U. S. A., and therefore we know what big prices mean to the manufacturer

LOGGING LOCOMOTIVES

Locomotives on trunk line railroads have the advantage of the best facilities for inspection and repairs.

Logging locomotives face different conditions. They must work day after day in the hardest service, and often in localities where repairs cannot be made without great inconvenience. That is why we build our logging locomotives from interchangeable stock parts. With this system every part must fit every other locomotive of the same size and design, and long delays waiting for duplicate parts are avoided. Interchangeable parts kept on hand at our Works for prompt shipment

GRATON & KNIGHT

Standardized Series

LEATHER BELTING

Tanned by us for belting use

GRATON & KNIGHT 1851

Common Sense in the Standardization of Belting

You have standardized your signature.

You buy standardized tools, and a hundred other standardized things, instead of having them made to order. It is safer for you—easier and more economical.

Why don't you standardize your belting?

Consider what standardization has done for your own product; for other products you use.

Translate these advantages into terms of belting.

Analyze belt installations. You find the requirements of power transmission fall into a small number of sharply defined classes—about a dozen if you define them scientifically.

Standardized Belting offers you a standard belt that is exactly suited to each one of these classes. You adopt the one that is fitted to the needs of your own work. That is standardization—just plain common sense applied to power transmission.

There are Graton & Knight Heart, GraKnight, GraKnight Dynamo, Spartan, Neptune and other Standard Brands—all standardized on the basis of work to be done and conditions to be met.

Standardize your belts. Consult our representatives. Submit your power transmission problems to our mechanical laboratory—get **expert** advice.

Write for description of Graton & Knight Sandardized Series of Leather Belts, with full information about Standardization as applied to Belting

Buy

FIRE BRICK

On a Quality Basis

Use as much care in its selection as you would in choosing the lumber that goes into your products.

No brick gives the best results for every purpose. The brick you would use for your refuse burner may not give you the best results for your Dutch Oven.

We Manufacture the Following Well Known Brands

"Elkco Special," "Elk Steel," "St. Marys," "Keystone" and "Rotex"

When sending us your inquiries, specify for what purpose you need the brick.

We Make a Specialty of
REFUSE BURNERS, BOILER SETTINGS, KILNS, DUTCH OVENS, ETC.

Catalog sent upon request.

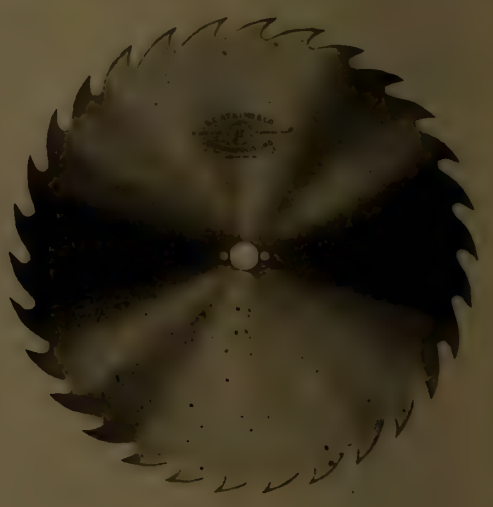
ATKINS

ALWAYS AHEAD!

The most advanced improvements in Saw manufacture have placed us far ahead in the manufacture of Saws for all uses.

Our Band and Circular Saws are worthy examples. They cut more timber—do it with less power and require less repair to be kept in perfect condition.



Economy in mill operation has proved their value. Put them through competitive tests with other Saws.

The Sterling quality of

Atkins Sterling Steel Saws

will overcome your difficulties.

Chapman Double
Ball Bearing C/o

Dear Sirs

In regard to double ball bearings supplied by you, we find those on line shaft giving entire satisfaction and find them quite a saving on power, as for the ball bearing loose pulleys, they are decidedly the finest and only satisfactory loose pulley we have ever had, no noise or heating and consequently no loss of time, which so frequently occurs with the ordinary loose pulley, we have run the loose pulley on our big matcher for nearly two years and consider it a severe test and it runs as nice to day as the first day we used it can recommend your bearings and pulleys to any one in the manufacturing business especially planing mill work which we have proved.

Yours very truly
L. A. DeLaplante Limited
per W. Costain Supt.

Chapman Double Ball Bearings

have been installed in over 3000 factories of all classes during the past fifteen years, and the above letter is one of many of a similar import, bearing testimony to the efficiency, long life, and cleanliness of the bearing. Some of these have been compiled in a booklet, "Results", which we will be pleased to send on request.

THE E. LONG MANUFACTURING CO.
SAW MILL MACHINERY
ORILLIA, CANADA

Vertical Steam Feed Valve

By reference to the cut, you will note that the valve stems are so connected to the bell cranks that one valve balances the other, therefore they are without friction and work very easily.

Being a vertical valve, the plug is virtually suspended in a film of oil, consequently, will remain steam tight for a long time. It is self draining, and being a vertical valve and connected as shown, when the sawyer's lever is plumb they are both on the centre, and therefore no amount of expansion will affect their proper working.

The exhaust, which is a mixture of steam and water, does not pass through the valve proper, but out underneath the plug, directly into the atmosphere, hence the valves do not stick or kick.

Should the connections break, the plug drops to position, completely closing the ports, thus making a safety valve as well as an operating valve. All valves are thoroughly tested under steam pressure before shipment.

Have you our catalogue?

The E. Long Mfg. Co. Ltd., Orillia

An Edger for 6" Cants

You can put a 6-in. cant through this edger and know that it will come through edged to a hair. Edger carries 22-in. saws, 6-in. saw collars, leaving 7-in. clear saw blade, more than enough margin for 6-in. stock

Mandrel is 3⅞-in. in diameter, the three bearings that support it are each almost 10-in. long—the rest of the machine is built in proportion. That's why Waterous New Champion Edgers can be crowded to the limit and will turn out full capacity, day after day, without straining.

Notice the feed rolls, two before and two behind the saws. They are machine fluted to give a firm, secure grip on the timber that holds it fast, but will not mar it in any way.

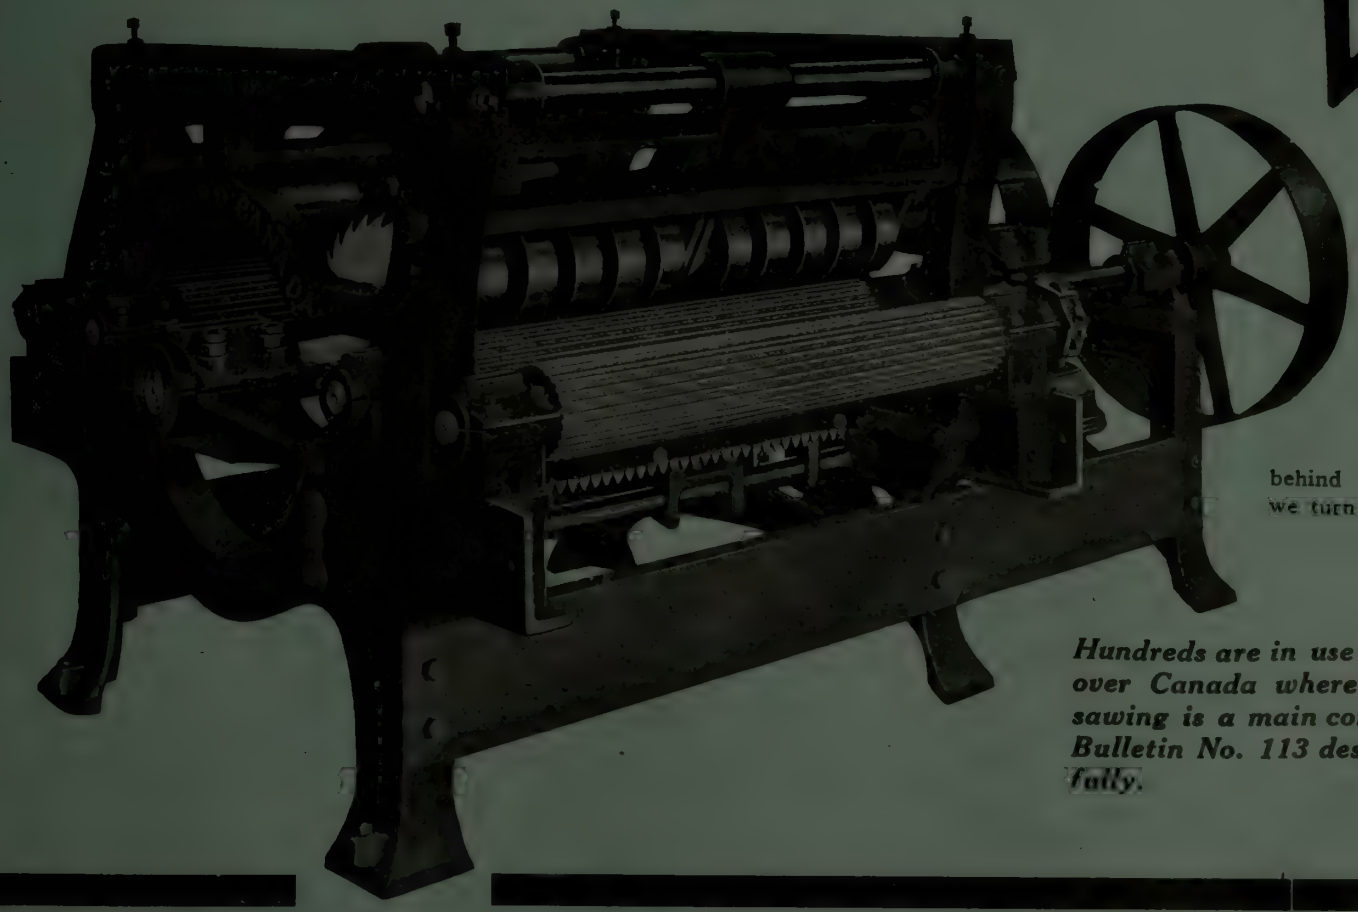
The press rolls are divided, too, making both sides of the machine independent of each other. It's a worth while feature, decidedly.

We build up-to-date Machinery for Sawmills of every capacity—circular or band
Catalogues on request

WATEROUS NEW CHAMPION EDGERS

are built with 40", 48", 56", 60" and 72" opening. They carry as many as four movable and two stationary saws without difficulty.

These edgers cut true and to dimension at all times. The guides are rigid and cannot shift in the cut. They are crowded to correct position and held immovably in place by a steel setting gauge that drops upon them. *No other edger has this feature.*



Waterous New Champion Edgers are fast and accurate cutting, easily operated, and perfectly safe. We stand behind every machine we turn out.

Hundreds are in use in mills all over Canada where quality of sawing is a main consideration. Bulletin No. 113 describes them fully.

The Waterous Engine Works Co., Ltd., Brantford, Canada

$5,000,000.00
worth of mixed metal sold annually.

"FROST KING" METAL

Our thirty-five years experience in metal mixing enables us to place on the market a babbitt that we believe to be absolutely perfect. For high speed machinery and engine work it is without an equal. It is specially designed for saw-mills, planing mills, threshing engines, traction engines, pumps, rolling mills, pulp machinery, and all classes of stationary engines. It is a high grade metal made of the very best selected stock, and carefully compounded.

If your dealer does not stock FROST KING send us a money order for your requirements. Price **30c per lb., Fort William and East; West of Fort William 35c per lb.,** delivered nearest railway station; packed in 30 lb. and 60 lb. boxes.

For extra duty, such as over-hanging saws, our TROJAN BABBITT will stand where all other metals will fail. Price, Fort William and East, **40c per lb.**; West of Fort William, **45c,** delivered to your nearest railway station; packed in 30 lb. and 60 lb. boxes.

HOYT METAL CO., Toronto, Canada

Have factory and office at Eastern Avenue and Lewis Street, Toronto, Canada

Factories also at:— New York, N. Y. London, Eng. St. Louis, Mo.

Not altogether what we say but what users say

"We have used the Alligator or Warping Tug manufactured by you for the last 7 or 8 years, and consider them indispensable to lumbermen on waters of French River or similar streams."

Will move a bag containing 60,000 logs, in calm weather, 30,000 in a head wind.

FOR SALE

Standing Timber

in Large or Small Blocks

and

Sawmill Machinery

The undersigned offer for sale, in large or small blocks all their remaining timber lands, mills and town property situated in the town of Parry Sound, Ont.

We have sold quite a number of timber parcels but still have some good bargains left in Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, McConkey, Mills, Allen, Secord, Falconbridge and Street.

Special bargains in the townships of Falconbridge and Street for small mills.

We have the following Sawmill Machinery For Sale:

1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 3-block right hand steam feed carriage fitted with steam set works, made by Wm. Hamilton, Peterboro, with 10-in. steam feed cylinder.
1 Double cylinder steam nigger, right hand.
1 Log Loader for right hand mill.
1 8 ft. Double-cutting Telescope Band Mill, made by Waterous Engine Works.
1 10 in. Double-cylinder steam feed carriage, left hand, for cutting 24-ft. logs.
1 left-hand steam nigger.
1 Log-loader.
1 Endless chain jack ladder with two kickers complete for right and left hand mills.
2 Roger Gang Edgers for 8-in. cants and lumber.
1 Waterous double edger, 6 saws.
1 2-saw Trimmer.
1 20-ft. Slash Table.
1 16-ft. Revolving Slash Table
1 70-ft. Transfer Chain for sorting lumber, with necessary levers, rolls and transfer chains to complete outfit.
1 Lath Mill with bolter.
2 Lath Trimming Saws.

FILING ROOM

1 Automatic Filing Machine for 12-in. D.C. band saws.
1 Hand Machine for cut-off saws.

POWER PLANT

1 Double Duplex, high pressure Water Pump.
5 60-in. x 16-ft. Return Tubular Boilers, allowed 125 lbs. steam.
2 125 h.p. Water Wheels.
1 Upright Engine for sawdust conveyor.
1 10 h.p. Engine.
1 Wood Machine for 22-in. wood.
1 Edger for ripping dry lumber, installed.
1 30 light arc generator.

There is also a large quantity of shafting, pulleys, hangers, belting, tram cars and turn-tables, particulars of which may be had on application.

All of the above open for inspection at Parry Sound.

TERMS OF SUBSCRIPTION

Canada, United States and Great Britain, $2.00 per year, in advance; other foreign countries embraced in the General Postal Union, $3.00.

Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

Authorized by the Postmaster-General for Canada, for transmission as second-class matter.

Entered as second-class matter July 18th, 1914, at the Postoffice at Buffalo, N.Y., under the Act of Congress of March 3, 1879.

Vol. 37 **Toronto, September 15, 1917** **No. 18**

The Disposal of Logging Slash

The fire season in the woods will soon have come to an end—in fact, the danger may be said to be pretty well a thing of the past for this year, but the commencement of logging operations throughout Eastern Canada makes the subject of fire prevention interesting enough to discuss at this particular time. No doubt a good many loggers and lumbermen sometimes think that they hear too much about this matter, and that they know as well as anyone where the danger lies and how to prevent it. Nevertheles, the subject should not be set aside in such a manner, as its importance is too great. This is being recognized by the public and by governments, and the tendency of governments to introduce legislation making some sort of slash disposal obligatory brings it home to the lumber industry.

It is more than probable that important legislation regarding the disposal of slash will be enacted before long by some of the governments of Eastern Canada. Lumbermen ought to prepare in advance for any such development and do what they can to assist the governments in making the laws effective and satisfactory. The situation in the East is interestingly outlined in an article written by Mr. R. O. Sweezey, who has had long experience in the woods of Eastern Canada, which is published elsewhere in this issue. Mr. Sweezey points out that slash disposal regulations cannot be framed in such a manner as to be applicable alike to all portions of the country; that what is suitable for Ontario is not suitable for Quebec, and that conditions in Eastern Canada cannot be treated in the same manner as conditions in the West. It is of great importance, therefore, that any legislation which is enacted should be elastic enough to permit of the best results being obtained, and that local conditions should be the regulating factor in all cases. Mr. Sweezey's suggestion regarding the disposal of slash along the main highways of travel through the forests, where the fire risk is greatest, is probably the most practical proposal that has been made on this subject. It would furnish a useful amount of protection at a comparatively small cost, and would provide in the course of a short time sufficient experience to serve as a guide in extending the protection by more thorough disposal of slash if this is found to be necessary.

Whatever may be done in the way of introducing compulsory or state-regulated slash disposal, the matter is too important to be handled as some forestry matters have been handled by governments in the past. It is not a case for political treatment, but one which requires handling by practical lumbermen and foresters who appreciate the fire risk know the values of our forest resourses and have learned by experience how such problems are handled. There is a lot of valuable experience already available for dealing with the matter, and when the governments take it up extensively they should be able to adopt mehods which are certain to give immediate and generally satisfactory results.

Reducing Munition Output of Canada

As reported in the Canada Lumberman of September 1st, the British Minister of Munitions has definitely decided to reduce the extent of munitions production in Canada. Only an outline of the situation was available for publication in our previous issue. The matter came up for discussion in the Canadian House of Commons a short time ago, and Sir Thomas White, Minister of Finance, in reply to a question, said that a statement had been given out by the chairman of the Imperial Munitions Board saying that the British Minister of Munitions "has now advised that it is unnecessary to continue production in Canada on the present scale. He has directed that certain lines shall be discontinued; that other lines shall be produced in lessened quantities; while some lines are to be continued as at present.

"The effect of this will be to stop the production of shells and components at some plants which are now producing sizes no longer required.

"In other plants, where shells are made of sizes of which a reduced output only is required, it will mean working during the day only, thus stopping night work. In other plants, however, where sustained production is required, operations will be continued night as well as day.

"These changes have been anticipated by several important firms, who have already resumed, or are planning to resume, their pre-war activities in their own lines, while others are engaged in the production or preparation for production, of equipment needed for ships now under construction or to be built during 1918."

Sir Thomas White added that the Dominion Government had advanced up to date to the Imperial Munitions Board, for the purchase of munitions in Canada, the sum of $285,000,000. There had also been advanced to the Imperial Munitions Board by the chartered banks of Canada in the same connection the sum of $100,000,000. For many months past the Dominion Government had been advancing to the Imperial Treasurer for the purchase of munitions in Canada the sum of $25,000,000 per month. During July they had advanced $35,000,000; during August, $35,000,000, and were arranging to continue the advance of $25,000,000 a month during September, October, November, and December.

A reasonable inference to be drawn from this statement by the Minister of Finance is that, while the munitions industry in Canada is likely to decrease gradually from now on, a quite considerable amount of production will take place during the balance of the present year, at least. It seems probable that the intention then is to reduce the output slowly. Manufacturers in Canada, both of munitions and of other products in general, are likely to look with favor upon this method of handling the situation. While it is to be regretted that so many employees will be put into the awkward position resulting from the decrease in munitions output and the laying off of employees, this is a situation which was inevitable sooner or later, and it is a wise plan to bring about the change as gradually as possible. This will, in a large measure, reduce the disturbance resulting from the change. No large body of unemployed will be thrown upon the market suddenly, and it will be possible for other industries to absorb the employees more effectively and satisfactorily to all parties concerned if the process is a gradual one. It is important, also, to bear in mind the pur-

chasing power of the employees. The sudden withdrawal from the market of their demand for all the necessaries of life, and some of its luxuries, would have a very disturbing effect. As it is, only a comparatively small portion of these employees will be out of work at any one time, and the general trade disturbance will be slight.

Many manufacturers have already expressed themselves as well pleased with the plan that has been adopted. Lumber manufacturers, moreover, are hopeful that the change will be a benefit to them by making a larger number of employees available for woods operations during the coming winter and for mill operations next summer. Of course much can happen between now and then, and it is not wise to bank with any confidence upon an improvement of this nature. Operators who are putting crews into the woods now report conditions similar to those of last winter, when men were very difficult to obtain. This winter, moreover, wages are even higher and equipment and food more expensive, so that such relief as may develop out of the decrease in munitions production is being looked forward to with a great deal of interest.

The Retailer's Local Advertising

The retail lumberman can make more effective use of advertising in his local newspapers than almost any other tradesman in his district. This may seem a little bit exaggerated to some retailers who have not yet learned the full value of publicity of this sort, but experience has shown that very definite and extensive results are produced by retail lumbermen in this way. The matter is a simple one. It comes down to the preparation of attractive and timely advertisements, neatly arranged and frequently changed, so that the dealer's name is continually kept before the local readers, and that they almost unconsciously obtain the conviction that this particular dealer is one of the most wide awake business men of the community.

It is not much use for a retail lumberman simply to publish a business card in his local paper. Probably every one in the district knows just who the lumber dealers are and where their yards are located, so that the business card carries very little weight as an advertisement. In order to know how to make the best use of advertising space the retailer ought to put himself in the position of the man who is in the market for lumber. Instinctively such a man asks himself the question, "Where can I get the best lumber to the best advantage?" This is the time that advertising gets in its best work. Such a man will naturally decide in favor of a dealer who has been advertising in the most progressive manner. If there are two dealers advertising in the same community and one of them simply publishes a business card while the other draws attention from time to time to the suitability and value of his different lines of stock for the construction of comfortable homes and useful farm buildings, etc., the prospective customer will lean favorably towards the latter in 99 cases out of 100. The odd case in which he does not favor the progressive advertiser will probably be found to be influenced by something of a personal nature.

Advertising retail stocks is really a matter of continually appealing to possible customers in the most intimate manner that can be worked out. Probably the reference to the utility of a dealer's stocks in building comfortable homes or making much needed repairs and alterations is as good a line to take in such advertising as a dealer can devise. Even this, however, ought to be alternated with interesting personal material appealing to the prospective customers as definitely as possible, so that there may be no monotony about the advertising. It is possible, for instance, occasionally to use advertisements telling all about the ability of your yard to furnish good stocks and to make prompt delivery. Also it is a good plan to tell of the help you can give in the way of simplifying a customer's difficulties. Many a customer knows little or nothing about plan drawing and practically nothing about the suitability of different kinds of wood for different purposes. The retail lumber dealer can help him out of these difficulties in many cases, and if he draws attention to this every now and then in his advertising the fact will be uppermost in the customer's mind when he happens to be thinking of making a purchase.

The different seasons of the year provide opportunities for introducing new thoughts into advertising. Just at present, with the cold weather approaching, but a sufficient interval of fine weather for considerable building operations, it is a good plan to emphasize the home in advertising. Other seasons each have their definite lines that are in most demand. An example of an advertisement by the Valley Lumber Company, Ltd., published elsewhere in this issue, illustrates the point referred to. It is worked out in such a manner as to convince any farmer who has done well with his season's crops that it will be to his advantage now to spend some money upon building operations. Another point, which is particularly applicable to conditions existing to-day is also well brought out, namely, that nowadays a farmer can do better than he has been able to do in the past, as the prices he is obtaining for farm products are high, while lumber is comparatively cheap. This is a point that cannot be brought out too strongly, and is one that is likely to be overlooked by some dealers. The truth of the matter, however, is very clear, as has been pointed out in several preceding issues of the Canada Lumberman, namely, that a given amount of farm produce to-day is equal in value to a far greater quantity of lumber than was the case a few years ago.

Great Britain's Shortage of Houses

There has not been much discussion lately of the requirements of European countries in the way of new buildings after the war. For a time, when the enormous destruction caused by the war was first brought home to us, this subject was uppermost in our minds, but the continuance of the war over a period of three years and the concentration of our national and individual efforts upon the problems of winning it have led us to lay aside some of these subjects for the time being. In the early days of the war the discussion related chiefly to those countries which had been overrun by the Germans—Belgium, for instance—and the demand for building material that all this destruction involved was well appreciated. Plans were laid for handling this business and sharing in the trade which it would create.

Very few of us in those days had any idea that, in addition to this demand, another demand for buildings was developing which would be so great as to tax the producing efforts of every country. It is the case nevertheless that the necessity for new houses in Great Britain is so great to-day that the government is making plans as far in advance as possible to have the building program well under way, even before peace is declared. Before the war the housing problem in Great Britain had become very acute. There had been a steady stream of population flowing towards large industrial centres for several decades, and the erection of new buildings had lagged far behind the country's requirements. Many of the houses in which the working classes of Great Britain live are more than 100 years old. Even 125 and 150 years is not an exceptional age. An investigation into the older parts of Birmingham which was made in 1914 showed that there were at least 50,000 old dwellings that should be replaced, and a shortage, in addition to this, of from 10,000 to 20,000 houses. Reports from Manchester and other large industrial centres showed a similar state of affairs. For the physical well-being of the people and the industrial development and welfare of the nation it had come to be recognized that a remedy must be found without delay, and the government had promised aid in some form. Then the war intervened and the problem was laid aside for the time being. The government is again attacking the situation to-day and is likely to put its ideas into practice promptly.

In a recent article upon this subject the Timber Trades Journal, of London, England, says: "Scarcely any subject outside of that of the

war has received so much attention during the last few weeks as the housing of the working classes. There is no particular reason why the matter should be decided just at the present time, but every question comes to a head at one time or another, and the need for the announcement of some definite line of action has long been obvious. It will be remembered that just before the war broke out the government had promised aid of some description in order that the crying need for better accommodation might be met; but the solution of the problem, urgent as it was, was perforce postponed. The last three years have naturally brought the matter to a more acute stage, fresh building having been entirely suspended, except in certain munition areas. The government has now formulated the outline of its proposals, and with the authority of the War Cabinet the local government board has issued a circular to the various town, district, and metropolitan borough councils, stating the manner in which the problem is to be tackled. In brief, it is proposed to enlist to the full the services of the local authorities, and, in order to stimulate the activity of the local bodies, substantial financial aid will be given by the state. A striking statement has been drawn up by the joint committee on labor problems after the war consisting of representatives of many important and influential bodies. It is stated that no less than a million new houses will be required when the war ends, and that only by having them ready for occupancy will it be possible to prevent a heavy raise in rates (taxes) as soon as the restriction of rents and mortgages act expires. The cost is estimated at $1,250,000,000 and the suggestion is made that if any local body refuses to build its quota the local government board should itself undertake the work."

If the government of Great Britain continues its policy of restricting imports of timber and utilizing home-grown timber resources as much as possible the commencement of this building program will find inadequate stocks in the country for carrying it out. The end of the war, when it comes, will make the shortage more severe. There will undoubtedly be a pressing need for imports of Canadian timber as soon as this plan is put into effect. This is just one of the great sources of demand that are certain to develop for Canada's forest products. The United States and other lumber-producing countries will be on hand at the same time with large supplies, but the outlook is that there will be a sufficient demand to keep every producing plant busy for a long time to come.

It would not be wise to imagine that, on this account, business in timber and lumber and their manufactured products after the war will knock at the door of any country which is not aggressive enough to seek it. Although the demand will be greater than the world has ever known before, the competition among producing nations will be a great deal more keen. It must be borne in mind that in going after this trade two objects will be obtained. One is the immediate business which results and the other is the securing of a footing for future business. It is probable that a few producing countries will show themselves so thoroughly equipped for doing this business that they will obtain a stronger hold upon the trade than others, resembling the hold which Scandinavian countries, for instance, had upon some of the more important export markets before the war. There is a most important matter here for Canadian exporters to study. Aggressive methods will give them the hold upon this trade which their timber resources entitle them to, but which they will not obtain unless they show to the new markets the values and the services they can give are the best obtainable. When the war is over there will be a great shaking up in trade routes and markets, and the opportunity for Canada to do better in its export trade than it has in the past will be a wonderful one.

The Permanent Advantages of Wood

The permanent advantages of wood are well outlined in an article published by the Retail Lumber Dealers' Association of the State of Pennsylvania in their dealers' directory. It would be difficult to prepare a more convincing and interesting summary of the advantages of wood, so we reproduce it just as it is. The clever and persistent advertising given to many substitutes for wood and timber, the article says, might lead the reader to think that in a few years lumber will be either unnecessary or unobtainable. Wooden sidewalks went out of fashion long ago; wooden buildings and shingle roofs are not permitted in restricted sections of cities; boxes of paper and fibre are used in place of boxes formerly made of boards; steel passenger and freight cars and concrete culverts and bridges are common; while structures of concrete, brick, or tile are found on the farms, and steel rowboats glide about the pleasure parks. As a matter of fact, wood has been so cheap and abundant that it has been used for a multitude of temporary purposes and often for purposes for which other products are better suited.

Another stage of economic development has now been reached. Wood is taking its place as one of the finer materials and the coarser uses are being given over to coarser products. This makes it possible to have a relatively larger supply of wood for the purposes for which it is unquestionably the most suitable material. No doubt, also, some of the present use of substitutes is a temporary fad.

The permanent advantages offered by wood may be summed up as follows:

1. Its general availability. Wood is a natural product more widely distributed and more easily obtainable than any other structural material which the earth affords. The multiplicity of purposes for which it is used is surprising, even to those best informed upon the subject. A recent study of the wood-using industries of Illinois showed that in the factories birch is used in the manufacture of 154 different articles, and red oak, longleaf pine, red gum, yellow poplar, white pine, and basswood are each used for 100 to 140 different purposes. Moreover, the new uses developed for wood yearly through discovery and invention offset to some extent the lessened demand because of substitutes in other directions.

2. Wooden structures can be altered and moved or built over more easily and cheaply than can structures of any other material.

3. Wood is very strong for its weight, compared with other structural materials. The average weight of the woods ordinarily used is some 30 pounds per cubic foot; that of iron and steel is fourteen to fifteen times as much. This is a great advantage in handling. A bar of hickory greatly surpasses in tensile strength a bar of steel of the same weight and length. Similarly a block of hickory or longleaf pine will sustain a much greater weight in compression than a block of wrought iron of the same height and weight. Indeed, practically any piece of sound, straight-grained, dry wood is stronger than steel, weight for weight. Moreover, wood will sustain a far greater distortion of shape than metal without suffering permanent injury, while, of course, no such distortion can be sustained by either concrete or clay products.

4. Wood is easily worked with common tools, while to work the metals requires special tools and much power and time. Anyone with saw and plane and auger can build a structure of wood; an ironworker is a skilled mechanic, whose services come high.

5. Wood is a non-conductor of heat and electricity, as compared with metal; and of moisture, as compared with ordinary concrete and brick. These are points for serious consideration in home-building. They also explain why we prefer to sit on wooden seats, work at wooden desks, and eat at wooden tables.

6. Wood does not contract and expand with changes of temperature, while its tendency to shrink and swell with atmospheric conditions can be completely overcome by proper seasoning and painting; hence wood can be made to "stay where it is put."

7. Wood has a varied and beautiful figure, with which no other material can hope to compete, for furniture, house trim, and general decorative purposes. It gives a comfortable, homey atmosphere that can be obtained in no other way.

8. Wood offers a combination of strength, toughness, and elasticity not possessed by any other material. Imagine, if one can, a baseball bat, a golf club, or an axe handle of anything but wood!

Labor Situation Puzzles Operators

The Outlook from a Manufacturer's Viewpoint

Chapleau, Ont...

Editor Canada Lumberman:

As I see it, the lumber trade has reached about the same critical situation that almost every other line of business in the country has, as a consequence of the war. When war broke out, lumber, in contrast with many other stable commodities, was fairly plentiful. Mill yards throughout Ontario were pretty well filled up, and the dislocation of trade for a few months after the outbreak of war meant that the cut of 1915 moved very slowly, and a very considerable quantity was not marketed until late in 1916 and early in 1917.

With the gradual shrinkage in the supply of labor and the increase in cost of all supplies that entered into the lumber business during 1915-16 and 1916-17, the output of logs, and consequently the supply of lumber, has been very conbly reduced until the sawing season of 1917 found practically every mill in Northern Ontario either empty or sold right up to the last board, and the demand for lumber possibly more active than it has been for many years, with the result that, I believe 75 to 90 per cent. of the entire 1917 cut has already been placed in the hands of the wholesaler or distributor, and the demand still continues active. Under normal conditions, this would be an ideal situation, but under 1917 conditions it cannot be looked upon in that light.

Lumbermen naturally are anxious to keep abreast of the market and to feel that their mill yards will at least take care of all the demands placed upon them, so that, commencing with the logging season of 1917-18, almost every man in the business is anxious to take out as large a cut as their mills will handle; and, from the standpoint of the wholesaler and the consumer of lumber, this is as it should be. The difficult point, however, is here, and the question is, can the lumberman, under existing conditions, take out a sufficient quantity of logs to meet the demands that 1918 is likely to place on the lumber market? My own opinion is that it is going to be extremely difficult, for these reasons: The demand for labor in other lines of business is so great and the profits that it is possible to make in other lines of business are so far above normal that I do not believe the lumbermen can compete in the labor market without taking serious chances of not being able to produce lumber, even at the prices prevailing to-day, and without competing, the necessary men cannot possibly be secured. For example: The increase in the wholesale price of lumber has possibly been 30 per cent., while the prospective increase in the cost of operating for the season of 1917-18 is at least 80 to 100 per cent. The direct increase in the rates of wages that are being offered this season in comparison to the rates prevailing in 1913-14 and 1914-15 is 90 per cent. I believe I am well within the mark when I say the decrease in the efficiency of the men that it is possible to secure has been at least 20 per cent.

The increase in the cost of supplies that enter into the logging and sawmill business has been from 50 to 250 per cent. and an average of 100 above normal. I trust you will not look upon this letter as coming from a pessimist. I am one of those who believe that everything will ultimately adjust itself to meet prevailing conditions, but as you asked for a frank statement of what the outlook was as I saw it, I have just given you my frank opinion.

Geo. B. Nicholson.

Labor Very Scarce for Logging

Little Current, Ont., Sept. 4.

Editor Canada Lumberman:

Our intention is to operate three camps, if we can get the men. Labor seems to be very scarce, and chances are that, on account of shortage of labor, very few operators will be able to get in more than half a crop of logs during the coming season.

Little Current Lumber Company.

* * *

A Puzzling Situation for the Manufacturer

Editor Canada Lumberman:

In a few words, a lumbering operation this coming season looks like a huge gamble. While prices for lumber were never so high, there are so many elements that enter into the situation that, to my mind, it is impossible to make a forecast as to whether they will continue to be as high or go higher, or take a big slump some day. The logging conditions are something unheard of. Men are extremely scarce and very expensive to get, and hard to keep when you get them, and wages are now running at $50 to $55 a month and board. Board will be 30 per cent. higher than last year also.

Lumbermen with large amounts invested in sawmills and plants feel compelled to do something in order to keep the organization together, or, rather, that is about the way I look upon it. Others may take the view that prices of lumber will go higher, and probably think they see a profit even at the extraordinary cost. Cost of sawing this season has also advanced 30 to 35 per cent. over last year. If conditions remain as they are at the present time, by strenuous efforts we may succeed in getting enough logs to run one mill next season. After the harvest is gathered and a number of men are thus let off the farms, and a number of the munition plants are closed down, it is possible that labor may become a little easier a couple of months from now, in which case the production of logs might be added to to some extent.

Ontario Monufacturer.

Branding Canadian Timber Not Recommended By Australian Merchants

Glebe, Australia, July 10.

Editor Canada Lumberman:

We are in receipt of your letter dated 20th April, together with copy of the Canada Lumberman of April 15.

I have carefully read articles on pages 21 and 29 regarding the proposal to brand all Canadian timber exported to Australia. The writer of the latter seems very earnest in what he says, but there are many reasons why branding lumber in such a manner will neither be an acceptable nor a payable proposition. I went through Canada and the United States in 1901 and inspected all Oregon mills of any consequence. The Hastings sawmills, in Vancouver, at that time seemed to be about the best organized of them all, and these people have always, so far as the writer can remember, branded the whole of their product loaded for Australia with "H.S.M." on one end and the size and length on the other end of the timber. They have also seen to it that the quality has been right up to the average merchantable standard; but the only part which appealed to the merchants here was the fact that the lengths and sizes were branded on the end. We have purchased hundreds of million feet of Oregon since we have been in business, and the only United States mills that we know have branded their timber was one on the Columbia River; and the fact of their having branded it was a detriment if they only knew it, because I have never yet seen one of their cargoes up to the standard. Timber merchants of New South Wales in the past have had their individual initials branded on the timber by the importers, and some of them found it a great advantage when they have run short and had to buy the other fellow's brand, as they considered they were only advertising his business. Branding has, therefore, lapsed into any old form now, and is only used as a shipping precaution where a number of specifications for the various merchants are loaded in the one vessel. Latterly the United States mills have made a charge for this branding, and we, for one, do not purpose paying such charge, as we do not consider it necessary, especially as we usually buy full cargoes.

I have always been a stickler for preferential tariff within the Empire, as I believe this is the only way the difficulty could be overcome; but this war has altered the whole of the ideas of every person in the community. The fact of America entering the war on our side must entitle her to some consideration.

Your Melbourne correspondent refers to the fact of Baltic being branded by the various millers in Norway and Sweden; but where this has been a good thing for some mills who have supplied superior quality it has been a detriment to other millers who supplied ordinary quality timber. When you come down to bare bones you will find that the only concrete fact that weighs with any consumer is his pocket, and if your millers want to get into this market they will have to get their coats off. It seems to me useless incurring costs in spending money in branding timber when the other fellow does not do it, and we do not know any body who is able to tell the difference between Canadian and American Oregon. The better idea would be for the Canadian lumberman to combine together, build vessels made out of their own lumber to carry lumber here (as this would give them a great pull over American millers) and would make a profit by organization, both out of their timber and freight. This would obviate exploitation by private owners of vessels, and enable them to capture this market and hold it against competitors, both now and after the war.

Yours faithfully, George Hudson & Son, Ltd.,

George W. Hudson, Managing Director.

Hon. G. Howard Ferguson, Minister of Lands, Forests, and Mines for Ontario, reports that there have been fewer forest fires this year in Northern Ontario than for a number of years past.

No business can go far towards true success if suspicion and fear are the impulses which govern its members. Trade associations are the machinery of co-operation. Through them ignorant competition can be destroyed to a large extent merely by throwing light upon it, and the basis upon which business is conducted can generally be made more intelligent. . . . Trade associations are, in a way which we do not yet appreciate in this country, the means of salvation for business. In a thousand ways they can help to lift business to a higher plane of efficiency.—E. N. Hurley.

Court Decisions in Lumber Cases

Workmen's Compensation and Woodmen's Lien Problems Subjects of Legal Findings—Ownership of Young Timber

In the case of King vs. Berlin Mills Company (N.H.), 99 Atl. 289, an important judgment was recently given regarding the meaning of "at work in a shop, mill, or factory," under the laws of the State of New Hampshire. According to the judgment, a person employed in building a pulp carrier at a distance of over a mile from a pulp mill is not "at work in" the mill within the meaning of the Workmen's Compensation Act. The finding of the court includes the following statement: "It was held in Boody vs. K. and C. Manufacturing Company that work in a mill included not only the mill buildings in which the business is conducted, but also everything appurtenant to them, such as the dam, flume, yards, and the ways provided for the use of employees—the entire manufacturing plant. But this construction of the statute would not constitute labor performed in erecting a pulp carrier for the defendants more than a mile from their mills work in the defendants' mills, and in no sense a part of their manufacturing plant. To hold that building a pulp carrier for the defendants more than a mile from their mills is working in the mills within the meaning of the statute would lead to results never contemplated by the legislature. Under such an interpretation of the statute those engaged for the defendants in felling trees and hauling them from the forest many miles from their mills could be said to be working in their mills. Indeed, it is dufficult to imagine any manual or mechanical labor that employees of a manufacturing concern could do that might not be construed as work in a shop, mill, or factory. The English Workmen's Compensation Act of 1897 (60 and 61 Vict., c. 37) contained the following clause: 'This act shall apply not only to employment by the undertakers as hereinafter defined, on or in or about a railway, factory, mine, quarry, or engineering work.' This provision is somewhat similar to that portion of our statute that is under discussion, although it is more comprehensive and elastic than our law, in that the word 'about' is used. The English courts in construing the above clause have held that employment at places separate and at some distance from factories, mines, quarries, or engineering works was not work on or in or about them, but that the employment must be at a place contiguous or in close proximity to them, to bring it within the purview of the statute."

Who Owns the Young Growth?

"Does a limit-holder own the young growth?" A most interesting decision on this point was rendered recently in the courts of Quebec by Judge L. J. A. Desy, of the Superior Court, Three Rivers District. Judge Desy decided that a licensee could sue on fire damage caused not only to his timber of legal size, but to what had not yet attained the dimensions on which his cutting rights were based.

The dispute arose through a suit instituted by a licensee against a railroad contractor who, in the face of warnings, had set fire to a pile of old ties, and caused a serious burn in adjoining timber and young growth, but particularly to the latter. The defendant's lawyer entered the ingenious plea that as the licensee was permitted by the government to cut only what was of a given diameter that, therefore, the government was the owner of what fell under that diameter. Licenses being renewed year by year, argued the defendant, it was preposterous to assert that a license-holder had more than a year's cutting rights, or could assert that certain trees would become his property many years hence when they had reached maturity.

Judge Desy, however, looked upon the licensee as the proprietor of the young growth for the reason that his rights in future increment could not well be cancelled unless by violation of the government regulations. The defendant was obliged to settle the claim, which was in the neighborhood of four thousand dollars.

Court Denies Company's Right to Block Creek

Mr. Justice Morrison has given judgment in favor of the plaintiff in the case of T. B. Buchanan against the Barclay Shingle Mills, Ltd., Vancouver, B.C., for damages for alleged blocking of Kanaka Creek with shingle bolts. His lordship held that the company had no right to block the creek in the manner they had done. The form of the injunction against future blocking and the amount of damages will be the subject of further consideration. The judgment is subject to the right of the defendants to carry on their operations on the creek in a legal manner.

Logging Time-Keeper Not Entitled to a Lien

A time-keeper in a logging camp in British Columbia recently brought suit against his employers, under a woodmen's lien claim. His Honor Judge Schultz, after hearing the evidence and arguments, decided that a time-keeper in a lumber camp is not entitled to a woodman's lien, although a time-keeper in a mill is entitled to it. The point arose in the case of Vickery vs. Crockett & Olds.

Robert Dollar Reports Expanding Trade

Mr. Robert Dollar, of the Dollar Steamship Line, Vancouver, B.C., in a recent interview, stated that his company was now handling more freight for overseas than the C.P.R., and the C.P.R. was handling more than it had ever handled previously. "We have not taken a ton of freight from that company," said Mr. Dollar, "but it is all new business that we have transferred from San Francisco when we made Vancouver our home port. The prospects are good, and would be brighter only for the difficulty encountered because of the government stepping in and commandeering space. For instance, we might agree to take some freight for the far East and then the government might come along and say that it required the space. It would make no difference that the space had already been allocated—the government would take it, and the other freight would have to be left."

Mr. Dollar has just returned from a trip across the Pacific, and he reports that trade is going through Vancouver in larger quantities than ever before. There is a shortage of tonnage, and freight rates are abnormally high. Since the establishment of the Dollar line at Vancouver the port's trade has almost doubled. The Robert Dollar Company has a number of lumber mills in China and Japan. Mr. Dollar reports that he is expecting a large extension of trade when conditions become normal. His firm will then build a number of new vessels.

Silver Spruce Demand Very Heavy

The urgency of the demand on the part of the allied governments for silver spruce for aeroplane construction is referred to by the Timber News, of London, Eng., as follows:

"This much-wanted wood cannot nowadays be secured in large enough quantities. The demand, in other words, is greater than the supply. Requirements to-day are for clear spruce of the finest quality, but this grade unfortunately cannot be produced on a very large scale. The proportion of logs coming strictly under this classification is very small indeed. Thus the price of silver spruce to-day has reached a very high level (anything from £100 to £130 per standard landed), and it is likely to go still higher unless some substitute can be found, which is very unlikely. The requirements for aeroplanes alone are very large, and for this work only the very best wood can be used. Wood of an inferior quality, and that cannot stand the required test, is quite useless for the purpose. Consequently, the government have to be very careful in selecting their purchases.

"America is also buying largely of silver spruce, and is going far afield to secure supplies of the wood. Thus it comes about that this particular wood is of great importance to both countries, not to speak of France and Italy, who are also much concerned over the question of supplies. Something, therefore, will certainly have to be done in order to regulate supplies to the respective allies. Canada, whence most of the better class of silver spruce comes, ought to be able to help in this direction, if she is not already doing so. Labor in Canada, unfortunately, is very difficult to obtain nowadays, and this is not helping the felling of the wood. The production of silver spruce, however, is of such extreme importance that the difficulty of procuring sufficient labor ought to be overcome in some way—even at the expense of recruiting."

Hardwood Markets Active and Firm

A summary of market conditions issued by the Hardwood Manufacturers' Association, says that the hardwood market generally continues active and strong with a heavy demand for all that the manufacturers are willing to sell, and production below normal. The dominating factor in the hardwood trade is government business, but furniture factories are running to the capacity of labor available; box factories are running full time, and the truck, vehicle and implement manufacturers are heavy buyers for the kinds of stock used in these industries. The demand for oak is good in the regular grades and thicknesses and unusually heavy for timbers, railroad material, etc., with an increased demand for the manufacture of furniture.

Government Orders Many Railway Cars

In the House of Commons recently the Minister of Railways and Canals stated that contracts had been awarded to the Canada Car Company for 4,000 cars, to the Eastern Car Company for 1,000, and to the National Car Company for 1,000. Four thousand of these are required for government railways and the remainder for Canadian Northern, Grand Trunk, and other lines. Delivery is to be made between October 1 and February 1.

A New Cargo Carrier in the B. C. Trade

The schooner Malahat has been fitted out at Victoria, B.C., for her maiden voyage, on which she will carry a full cargo of lumber from Port Alberni to Australia. The Malahat is the first windjammer to visit Alberni for a number of years. During her maiden trip she will be a real windjammer, as her auxiliary Bolinder engines have not yet arrived from Sweden.

A Diagnosis of Retail Lumber Ailments

Failure to Keep Abreast of Modern Selling and Serving Ideals Responsible for Falling Behind in the Race for Business

At the annual meeting of the National Retail Lumber Dealers' Association, on September 7, Mr. Julius Seidel, of St. Louis, delivered an excellent address, in which he pointed out some of the reasons why the retail lumber business has suffered in comparison with other lines of business. Mr. Seidel's remarks were as follows:—

The subject of my address was assigned to me by the secretary and is not of my own choosing. However, it covers a broad spread. It demands: First, a diagnosis on what appears to be a very sick patient, and secondly, after the diagnosis is finished, asks for suggestions as to corrective treatment to bring the patient back to good health, with resultant happiness and long life.

Well, why does the retail lumber business suffer? Suffering comes after an ailment has taken hold of us. Unless in case of an accident, suffering is the aftermath of sickness long endured. Thus it is a foregone conclusion that if suffering there be, it was occasioned by errors of many years ago, not a few of which are easy to locate. For a nucleus let us turn the dial back about twenty-five years, to a time when white pine was king of woods and the carpenter was master of construction. That was the period when we were so ruddy with good health that we believed nothing could befall us. We lived in an era in which we simply sold lumber. The carpenter boss was the intermediary between the actual consumer and the retail dealer. Upon the carpenter evolved the promotion of lumber. His word "went" as an authority for the public on uses of lumber. No retail lumber merchant, generally speaking, professed to have a knowledge of building construction. Very few could read plans or make a study of them. The use of the correct grade was of little concern to the retailer, and he rarely traced an item to its ultimate use. He sent what was ordered —without a care. The demands of the home owner were not so exacting as now. The carpenter could sketch a building that "went" and satisfied the modest home-owner.

Everybody for Himself

The concern of the carpenter boss then was his own livelihood, and as there then were many more items on a building, which were commercial for lumber uses than there are now, both he and the retailer fared well. Foundation planks, then of lumber, are now of concrete. Posts and underpinning, then of cedar and oak, are now of cinder, gravel or crushed stone concrete. Cellar posts, then of lumber, are now brick or iron. Exposed stairways and outside porches have turned on lumber and are now built of substitute materials.

The failure to use a correct species of durable lumber for exposures has, furthermore, changed outside work to inclosed work inside the brick walls. Inside stairs and screened porches are fair illustrations of my thought. Perhaps custom has changed, but I claim custom and the present-day ways of building have also been largely influenced by faulty construction, causing fire hazard and, through the use of wrong species of wood, causing premature dry-rot and decay.

Studding, because not fireproof, has been dropped for expanded metal and wire partitions. Roof coverings have been changed from shingles to substitutes. Basement flooring was short-lived because of the failure to use a preservative, hence lost to lumber, gave way to cement, brick and asphalt. Out-door fences are now being built of wire, and garages and barns of metal or metal covering. Even benches are now constructed of tile products or concrete. These, in part, and many more symptoms, got into the system of the lumber business, with no effort whatever on our part to find an antidote. Every curtailment of lumber uses affected the carpenter boss and so from year to year fewer carpenters were boosting for lumber.

The New Booster

The newly created trade resulting from this state of affairs, viz., cement works, tile and sewer pipe, roofing paper, wallboard, etc., brought out competitors who are boosting for the substitute products. Every man, if he is an adept at his trade, can do his work well, becomes an enthusiast and sows the seed for his own future.

So we note that we had gotten away from the public, the ultimate and real user of any product. We had a feeling that we had no right to approach an owner directly to influence his preference for wood; it might offend the carpenter. He, the carpenter, was looking after our interest. We had a horror about seeing the architect; he might resent our suggestions as a reflection on his judgment as to the proper material to be used. The fact of the matter is that we did not mix with the public sufficiently to feel the pulse of progressive thought about building, and we are a far way off from it today.

Our methods of selling were, and still are, indirect. Instead of leading right up to a subject, we figured on the carpenter's protection, little realizing that his prominent position had been wrested from him and that the general contractor, engineer or architect had superseded him on the job. Less carpenter work for the mechanic meant a holding on by him of all he could get out of lumber for his work.

Saving of labor to reduce costs of lumber was not his concern, but it should have been ours. Carpenter work had risen from twenty-five cents and thirty cents to sixty-five cents an hour, thus putting lumber, when finally trimmed and prepared by hand, under an extreme handicap. He went the way of least resistance, and putting lumber in a more utilitarian shape was not even suggested by us—it was so much easier to sell it in the crude. We have thus forced higher ultimate costs on lumber and suffered defeat as a consequence.

A Comparison with Other Lines

We have failed to grasp the "big idea" that our business has become intensely scientific. Just for comparison, let me say that when brick for walls was found too absorbent, science made it possible to produce a vitrified brick that would shed water. When paving-bricks failed, the manufacturer produced a paver that would withstand heavy traffic. When it was discovered that a change in color schemes, or face effects, interested the public, the brick manufacturers surely did not consult the bricklayers first before acting, but proceeded to preserve their business and thereby hold the job for the merchant, too.

The use of iron and steel products has been expanded by preparing at the factory, and that with the modern machines, many articles that were formerly fitted or prepared on the building site. Only the final placing of iron is now done by the erector. Beams, girders, grills, sills, in fact, all similar articles, are measured in advance and delivery made at a building in finished condition. Are the foundry and steel works selfish in so doing? No, indeed, and by reducing costs they expanded the uses of all kinds of iron and steel products and made more jobs for the iron-working craft, too.

The plumber formerly had rolls of lead pipe and accessories delivered at the building and there prepared them. The plumbing supply houses today have their showrooms where the public can see the latest in fixtures. Material now comes in units. The plumber is an erector of these wares. Has the plumbing supply house hurt the plumber? Why, no, it has developed the plumber's business beyond the dreams of the most utopian mind in the business. The mechanic on the job is still working overtime and the best evidence to show that we love him is the fact that a monthly plumber's bill is considered a part of the legitimate overhead of a well-regulated home.

I might add more illustrations, but the foregoing should be convincing. Gentlemen, I repeat that in comparison with other lines, we have failed entirely to realize that our business has drifted from a purely selling counter to a scientific business, an intensely scientific business at that. Less business means more competition to secure what little is offered. We have, in consequence, depraved our business to meet a price, instead of elevating it to a scientific trade. We, as retailers, have not served the public well because we try to do business on too low an overhead.

Erroneous Service Ideas

With a flourish of printer's ink we advertise service. Wherein do you serve much better than of old? The purchase of a motor truck does not expand the use of lumber. It is simply a convenience for quicker delivery. Warehousing of high-grade lumber in sheds is not a service, but only the common sense thing to do in order to save yourself from a loss. Having telephones is not service in the sense of expanding the use of lumber, because there was a greater demand for lumber before the telephone existed. The telephone serves the customer as a means of getting more competition, but is not a promotion expander. After all, the service of the retail lumberman has been incidental.

Surfaced lumber has, perhaps, been the longest forward step. End-matched flooring, I take it, was introduced rather to get a larger percent. of uppers out of the wood than with a view of reducing the ultimate cost to the consumer, when laid.

Now, having set out causes and drawn comparisons with other lines, we will discuss a few remedies. Let us set aside entirely the thought of immediate gain or profit, for that has been the goal which has put us on the rocks. Rather let us view broadly the necessities for the economic and practical development of our business, even though we may not reap the resultant benefits thereof for many years.

Individual discernment in this direction fails of accomplishment: First, because the expense of an investment in promotion propaganda is too great for one man to bear where the entire trade benefits, and,

secondly, because many a progressive thought fails of fruition on account of the "knocker" who stamps it under foot, either through ignorance or for the sake of prejudice, or hate and envy.

The Lumber Patch-Quilt

The lumber business in its many ramifications is, as I have often said, still a patch-quilt of units. The question of "burden" is at the root of all our trouble. In figuring the benefits of lumber promotion, I have found it difficult to reach a foundation for cost distribution or assessment. Of course, the timber holder should be interested, but to what extent? If the timber is in possession of private owners, these do not, perhaps, as fully appreciate what we are up against as does the combined timber holder and sawmill operator. The wholesaler, as a distributor of stock only, cannot be expected to be as deeply involved in the subject as millman and retailer, since his investment is not as large, hence not so greatly affected. Because the retail yard is directly as much concerned as the sawmill, the conclusion that the burden is largely on mill operator and retail dealer lies very near.

When it comes to co-operative lumber promotion, the retailer has done nothing of a state or national scope. The retailer has accepted the paternal offerings of the sawmill associations and is almost wholly dependent upon them for the big work. Not until the National Lumber Manufacturers' Association developed authoritative data on stresses, did we have anything in our business that was of real benefit to the public.

We simply must look at our business more seriously, if we hope for better things in the future. That means greater thought and effort by the individual and his shouldering a greater share of the burden of cost. We all owe an obligation to our business, and if there is a supreme body to show the way to success, we must co-operate with that body.

The next remedy is the knowledge of costs. The distribution of expense in an efficiently conducted retail yard is the fundamental thing that spells success. Our very first consideration, and one that needs a more thorough understanding, is as to what constitutes overhead.

With a correct interpretation of cost, promotion of lumber will require its just recognition as part of the overhead of retailing. The sooner you open this new account on your ledger and take a delight in seeing the amount charged to it spreading, the sooner will you see the light. High-grade advertising is nothing else than promotion and properly belongs to a fixed expense of doing business. Putting your name before the public is identification only, it is not advertising. Attracting the public to your product, irrespective of the fact that that public now is a customer or may at any future time become one, is building wisely and is true promotion. It puts a sale "across the plate" for someone who sells lumber—although you may not be the "someone."

Selling Methods of Now-a-Days

Now, to sell lumber well requires a thorough knowledge of lumber, therefore do not expect of your salesman qualifications which you do not possess yourself. The world moves, and so should you if you want to stay in the retailing of lumber, although you do not have to make 25,000 miles in 24 hours to be in the running. The larger percent of the retail salesmen are untrained, that is, they are not versed in grades, have not the technical knowledge of woods and are put on the streets with limited commercial training. These are lumber's representatives and are supposed to make a "hit" with a prospect.

Gentlemen, I picture our future salesman in the retail business as quite a different man from our present employee. He must be trained to meet the demands of the hour. He must have a college education to begin with, a thorough manual training in wood construction, a course in architecture and engineering, a course in forestry and a course in inspection—commercial training—and salesmanship will follow in the wake. Gift of knowledge stands and impresses where gift of tongue alone fails.

It requires intelligence, education and thorough training to fascinate, to attract to you, and to win for you the respect and confidence of the public you serve. You can only dominate over brains by having a greater knowledge of a subject than has the man to whom you are talking. Our present salesmen have been trained in the "go-to-it" school, that is, "down to a price." If they are not money makers it is because they were not graduated in promotion work and trade building.

The larger cities can change this condition tomorrow if they care to, by engaging a disciplined body of authortative men. We can jointly well afford to have on our payroll, in fact, it will be imperative to do so, a competent architect and an engineer in an advisory and promotive capacity. Their duties would include visits to architects, structural engineers, real estate dealers, building commissioners, street commissioners, and others. In the interest of all the yards of a city they could also visit owners and lessees, in short, the public and ultimate users of lumber, for the purpose of influencing them in considering the use of wood. They would offer free service upon questions of best modes of construction and free data on advisable species of wood to use.

The ratio of efficient salesmen to inefficient is overwhelming. We must stand ready to get bigger men to evolve big ideas, for it's a bigger problem before us that we must solve, if we survive. We might have influenced many a man, who is now spending all he saved on his auto, to invest in a home. The auto dealers, however, have got the public to thinking that an auto is a first consideration and the home investment will keep. Renting, you know, is good everywhere, but buyers of homes are on the wane.

Our business having become more scientific and our stocks more diversified, I am prompted to say that we must pay a price for better shed labor. It is difficult to get an apprentice in the lumber business, because the future does not offer sufficient inducements. Skilled labor and intelligent workmen are commanding better salaries in other lines and lumber must do equally as well to get good help.

Getting Closer to the Public

If we are out to interest the public we must be prepared to offer a "store service" or intelligent presentation. That means getting away from retailing on the tonnage basis. Talk to the public so they will understand you. Give the consumer a price by the piece or per board. Take the time to make up a list that way and give it to the clerk and yard loader. He will like it better, too. The man in the trade understands board feet prices and per thousand quotations, but the public does not. The impression that lumber is high can always be traced to the small consumer, to whom you quoted, to illustrate: $35 per thousand when he wanted only one piece 2 x 4-12, worth 28 cents.

A trade school for our business, where employees can get an education that would better fit them for their positions, is an essential. I know our superintendent of public schools has introduced special training courses, fostered by and asked for by certain lines of business. Then why not we also? These lines of business, you understand, pay a large part of the expense, and this is what we must meet and can meet. State associations should long ago have encouraged this more, for there are enough educational institutions, even outside of the public schools of large cities, that we could select for the training of which I speak.

A school of instruction should be fostered by local, state and national asociations, to the end that our business be elevated and the public thereby better served. Just as soon as the heads of retail yards get away from detail and devote more time to policies, just so soon will we advance our trenches. Then, indeed, will we full appreciate progressive initative.

It is not many years back when we ridiculed the introduction of ready-cut lumber—probably because it came from the outside, namely, mail order concerns—but it has been proved and has justified itself, because many companies have since moved a peg further and are building sectional houses of all kinds. There must be a demand judging from the number engaged in the work, then why not fit yourselves to this evolution? No matter in what form it may be used, be careful to see that the use of wood is continued. We can sell ready-cut and sectional houses just as well as the other fellow, if not singly then by a co-operative move of several concerns. Building sectional houses is here "for keeps." These houses have been proved a success in Germany and England, where they are produced in a more ornate and superior type than in our country. It's a progressive departure, so why condemn it? Really, aren't we just a bit jealous because we could not read the future as well as the outsiders who beat us to it and got there first?

Benefiting by the Progress of Others

A closer scrutiny of ourselves, and a comparison of our methods with those of others who have been successful, would lead an unbiased mind to reason that the retailer of lumber who is constantly complaining of his competitors' methods is not efficient. Do not forget that the advertising of ready-cut lumber and sectional houses is helping you, because it is advertising wood construction. Then ask yourself the question, "How much am I chipping in on this asset to help further the sentiment for wood?" When it comes to advertising, therefore, our business needs to be so revamped that the story of the use of wood will be absorbed by the public through having it told in their language.

An Important Sale of Horses, Wagons, Sleighs, Etc.

The Imperial Munitions Board, Aviation Department, have instructed Mr. Walter Harland Smith, Toronto, to sell by auction at the Union Stock Yards, Toronto, their entire plant used in construction work. This includes 200 horses, 100 sets of harness, and 100 wagons, sleighs, etc. The sale will take place on September 17, 18, and 19—next Monday, Tuesday, and Wednesday.

Some Ideas in the Planing Mill

By G. H. O.

The reason the planing mill man does not make stock sash is because he can't compete with the methods in use in the large Western plants that specialize in this particular line of work, but I recently happened on a planing mill owner who is turning his large trade in Western-made sash to account and diverting a few extra dollars into his own pocket.

He buys the sash K.D., in carload lots, all of a two-light size, and has them piled in his storeroom, with each size in a different rack and each rack marked so there is no trouble in locating the right size. If an order comes in for a four or six-light sash, he takes the stiles and centre-bar and makes the necessary tenons for the bars, one tenon for four lights and two tenons for six lights, etc. Most of any kind of a freak window, two lights on the bottom and six on top, or other combinations, can be made from a two-light window.

After the window is put together it is cleaned up thoroughly, and cannot be distinguished from a sash made to order right in the shop—and that is what he charges for, a window made to order. Why not? He has put the sash together in a substantial manner—just the same kind of work he would have performed had he gotten out the stock—and if someone else can furnish the stock and machine the stiles and rails cheaper than he can that is nobody's business but his own.

This man also goes a step farther in his figuring, and buys most of his lumber dressed and kilned. Remember, he is getting out house finish, store fittings, etc., instead of furniture. He has been in business a long time and never had a drykiln. He figures that the cost of a kiln is large and the upkeep still larger, and, as he operates his shop with electric power, he can keep his shop and office warm in winter on the waste from his shop, and save buying the coal that would be necessary in operating a kiln.

In regard to the drying of lumber, he claims he can get more uniform results by letting someone who specializes in the work do it. When the lumber is shipped to him he places it in a dry shed and allows it to adjust itself to the natural conditions of the atmosphere, so that when it is worked up into interior fittings it stays put. As to buying the lumber already dressed, which, of course, applies principally to oak, chestnut, and whitewood, he claims it is generally dressed to a standard thickness anyway, so why not let someone else do it especially as the cost is much less than he can perform the same work for?

This idea seems to be in line with a gradual change that is taking place in all its branches. The progressive furniture manufacturer no longer makes his own tops, panels, backs; and drawer bottoms. He has found that the panel manufacturer can do a better job and do it cheaper than he can. His shop has become to a certain extent an assembly plant. The piano-maker no longer manufactures his own action, but devotes his energies and skill to the building of the case, letting some other specialist attend to the rest. This idea of specialization is found in use in all branches of manufacturing, and the planing mill man is the last one to adopt it.—The Wood-Worker.

Effect of High Speed on Band Saws Ably Discussed by An Expert

The following interesting and instructive article on "The Effect of High Speed on Band Saws" appeared in the August issue of the Disston Crucible:

While we know there are still quite a number of operators who advocate high speeds, our own experience and observation has clearly shown that the band mills that run their log band saws at a speed of about 8,000 feet per minute are obtaining better results, both in quantity and quality of output of lumber than those who run at speeds of 10,000 feet per minute or more.

This, of course, applies more strongly where the power is ample, the appliances in perfect order and alignment, and the saws are operated and taken care of by thoroughly competent sawers and filers.

It is, of course, well understood that excessive speed tends to extra vibration, no matter how firm the foundation of the mill or how thoroughly installed. When the saw is running at very high speed it naturally tends to the same vibration and waving motion that applies to highly-speeded belts, and it is a rare thing to see a straining device that is sensitive enough to compensate fully for the excessive vibration in the blades. Consequently, under the feed pressure, high-speeded band saws are more apt to deviate from a true line than those of a normal or moderate speed.

Quite a number of operators still hold to the idea that high speed means high capacity, but it does not always follow by any means, for unless the apparent excess elasticity occasioned by the high travel of the saws can be absolutely compensated for by extra-weighted and highly sensitive straining devices the feed must necessarily be reduced per revolution of the saw on a moderate speed to compensate for a reduction in speed.

To specify more plainly, take for an illustration a 50-foot band saw, making 200 revolutions per minute, which equals 10,000 feet If this saw were cutting continuously at the rate of 12 inches per revolution that would equal 200 feet of feed per minute. Our experience has shown that it is easier to maintain a feed of 14 inches on 180 revolutions of the same saw than it is to maintain a feed of 14 inches on 180 revolutions of the same saw than it is to maintain a feed of 12 inches on the 200 revolutions, and a very little figuring will show you that a rate of 14 inches feed on the 180 revolutions is greater than 12 inches on the 200 revolutions, to say nothing of the wear and tear on all machinery, belts, and saws, besides enabling the operators to produce better manufactured lumber.

This principle will hold good at a less speed than 8,000 feet per minute, and to those who have not gone into this point thoroughly, and are inclined to feel a little skeptical on the subject, we will mention mills where the practice of quick stopping of the band saws at saw changing time by sawing a few lines from a "cant" left on the carriage for that purpose. It will be noted that as the speed of the saw decreases the feed per revolution of saw is increased, and this, too, at a time when the saw is dull, and therefore in a poor condition to stand the higher rate, but this is made possible only by the absence of vibration in the blade.

Of course, it is understood that we never advocate a reduction of speed at the expense of leverages in driving and receiving pulleys, as that would be sacrificing power, but a decrease in the size of the driver or an increase in the size of the receiving pulley to bring about the desired reduction in speed of saw without reducing leverages of pulleys and traction belts is bound to give better results, all other conditions being up to a good standard.

U. S. Government Orders 2½ Cent Newsprint

A great deal of excitement has been caused among paper manufacturers in the United States by an order issued by the Secretary of War to the International Paper Company directing the company to furnish to the government printer 200 tons of newsprint paper in 48-in. rolls at a price of 2½ cents per pound. The International Paper Company, of course, are complying with the order, but have protested that it is unjust, as the price is not enough to give them any profit.

Retail Advertising That Pulls

The two great things to bear in mind in retail lumber advertising are attractive appearance, from a typographical point of view, and a strong appeal to the reader. It would be hard to improve upon the accompanying example of an advertisement, used by the Valley Lumber Company, Ltd., of Minnedosa. It catches the reader's eye easily and interests him unfailingly. It is brief enough not to be a burden to the reader, but contains a strong and direct appeal to him, both from a cost and a service point of view. Such advertising can be counted upon to pull:

A Good Year to Build a Home

It certainly is.

You may never see a better year.

You live just once, and each year that you delay building your GOOD home the less time you have to enjoy it.

Waiting for an ideal year is slow, tedious work—the ideal year you look for may never come.

This year is as good as any; better than many.

Prices for all farm products are HIGH. Lumber is comparatively cheap, probably cheaper than it will be again for some time to come.

Let Us Help You Plan a Good, Comfortable Home

at once, so you can get it up before cold weather.

We make plans to order and furnish them free with material.

The Valley Lumber Co., Ltd.

Geo. W. Bridgman, Manager — *Minnedosa*

A Well Designed Advertisement for a Retail Lumber Dealer

The Banker's Relation to the Lumber Industry

By Col. Rowland E. Harvey, of Everett, Wash.

I know something about the lumber industry, perhaps more than the average man of my age. I was born and reared in a country that produced a man who for years was the greatest single-handed lumberman in the whole world—Alexander Gibson, of New Brunswick, who, when I was about 10 years old, had a fleet of 57 ships carrying his manufactured product to Europe.

You may think that strikes are an institution of the present day only. I well remember when the stevedores of St. John struck for more pay. Mr. Gibson was finally located and introduced at the Labor Temple. In a few words he told the strikers that the spruce deals he was shipping cost him more than he was receiving for them in Liverpool, meaning a loss of much money that year. He insisted that he was paying good wages, and would bring men from the States to take the places of the strikers if they did not go on with their work, which he did, placing a large guaranty fund as a matter of good faith. Other lumbermen and the banks joined him, and outside men were brought in, while St. John labor fought and looked on.

After making considerable money in the lumber business, Gibson, being a democrat and free trader, thought he could compete with the pauper labor of Europe in the manufacture of cotton. He built a great plant and went at it. He ran the mill about sixteen months, when he was obliged to close down, and the bats have been building nests in that mill ever since. Mr. Gibson died comparatively a poor man.

My father was enaged more or less in getting out logs, ship timber, and knees, which were floated down the St. John River to St. John, where they were shipped to Europe. I have no doubt that some of the ships being sunk these days by the submarine contain some of these timbers and knees. About thirty-nine years ago I went to Minnesota, where I worked for years in the several departments of the lumber business, and finally came to Washington about fifteen years ago, when the lumbering industry was in its infancy here. I have, therefore, followed the lumber business across the continent. When I went to work in the pineries of Minnesota the lumber business was in its infancy in that state, as it was in Wisconsin and Michigan. I have seen those three states pretty well cleared up. While they are still cutting a lot of lumber in Minnesota, Wisconsin, Michigan, and even in old New Brunswick, at the same time Washington is to-day the great lumber-producing state. This state cut 4,500,000,000 feet last year. The number of shingles manufactured was 7,700,000,000. In 1910 we manufactured 10,108,000,000 shingles. The lumber business is 40.4 per cent. of the entire manufacturing business of the state; 18.7 per cent. of the population is employed in the industry and receives 59.5 per cent. of the total wages paid in the state.

Of the total taxes of the state for all purposes, 47.3 per cent. is paid by the lumber industry and those engaged in it.

Aside from agriculture the lumber industry is three times greater than all other industries combined.

As a direct result of the work of the malcontent, street corner blatherskite, and agitator, labor has lost on an average of $4,000,000 a year for the last ten years in the lumber industry alone. This, added to a larger loss to the logger and manufacturer, constitutes by far the greatest economic waste in the state.

Including federal, state, and privately owned merchantable timber still standing in this state, there are 392,000,000,000 feet board measure. At the rate we are cutting to-day, figuring the natural increase, it will take about 100 years to clean it up. To assist in conserving this, the state's greatest resource, we should be reasonable in taxing standing timber. Exorbitant taxes on timber, which is only one crop, means overproduction, no profits, and the leaving of billions of feet of the poorer grades in the woods to be burned. Many holders of timber are compelled prematurely to slaughter their timber in order to save some of the money invested. In making this statement, gentlemen, I wish you to know that I do not own an acre of standing timber in the state.

If we could induce Congress to forget politics long enough to enact reasonable laws for the development of our water-powers it would mean cheaper manufacturing, and consequently cheaper lumber and nitrogen for the farmer. Congress should forget these hair-brained, self-appointed "conservators of the public interest," whose chief purpose is to keep their names before the public.

The lumberman has been the brave, sturdy, optimistic pioneer who blazed the trail and swamped out the tote-road over which the banker, the merchant, and all other lines came into the wilderness and began to develop a new country. He has always been at the front first, and by herculean effort and indomitable energy overcame every obstacle. His closest ally and about the first to join him at the front has been the banker. The timorous merchant, so often afraid to stand for his convictions, is sometimes ahead of the railroad, but the human parasite—the agitator—waits for comfortable, easy transportation—the railroad.

This rough, hardy life and frontier command accounts for the fact that every lumberman considers himself a major-general. Have you not noticed that there are no privates; that they are all leaders—generals?

This characteristic accounts for their inability to get together for the common good of the business and community. They have a hard time deciding who is to be king, and in the meantime combinations are put up, to the hurt of everybody.

Gentlemen, have you not noticed the great need of co-operation among lumbermen How often you have seen them shipping out their product for less than cost, and you worried to death about the loan you made? All for the lack of two things—honest co-operation and courage enough to sell the manufactured article.

Why should the lumbermen of this state go through all the agony and grief of producing the best article in America and then permit an irresponsible broker, without a dollar invested, to call them on the phone and put a price on the goods? This irresponsible broker is always beating down prices, and is a menace to the business.

The general run of our lumbermen may be generals, but they surely are not salesmen-merchants.

The environment of the lumberman, the big, broad life he has lived, makes him a general, but, being equal in rank, they don't like to take suggestions from one another.

Now, here is what I am getting at: The banker is really a partner, because he furnishes the money in most cases, and he is something of a general himself, and the lumberman will listen to him. That is why I am pointing out these shortsighted policies in the hope that you gentlemen will use your good offices in helping to correct these defects.

There is another important matter where the banker can help the lumberman and the whole state and nation. We are at war; the government needs ships. Washington has the best timber in the world for shipbuilding, but we must have steel cable to haul this timber to the mill. The government is taking practically all the cable made, and the logger can't get logs without steel cable. Can you not help us bring this shortsighted policy to the attention of Josephus Daniels, who, we understand, is grabbing all the steel cable? Remember, he needs ships as badly as submarine nets.

There is a common enemy to labor, the banker, business man, lumberman, and society in general, and that is the agitator under whatever name, who, under the guise of "free speech," is traveling about, preaching arson, murder, and treason.

Our courts and juries are impotent when it comes to prosecuting organized crime. There should be laws enacted defining the difference between "free speech" and treason or free license to burn and kill. In other words, "free speech" should not be made the goat to serve the arson and murder munger.

Co-operation and organization, together with "eternal vigilance," means liberty to-day.

U. S. Industry Shipments Exceed Production

Statistics compiled by the National Lumber Manufacturers' Association of the United States, show that during the twelve months ending July 31 the mills reporting to the Association cut 15,602,000,000 feet of lumber and shipped 15,741,000,000 feet, or 8.9 per cent. more than production. Shipments the first seven months of this year were 7.7 per cent. more than last year, with no increase in cut. During July this year 732 mills in all parts of the country and operating in all kinds of timber, cut 1,389,000,000 feet and shipped 1,566,000,000 feet, or 12.7 per cent. more than production. The cut in July this year was 1.3 per cent. less than July last year, with shipments 19.6 per cent. greater. During the four weeks just closed 320 southern and western mills have cut 606,000,000 feet of lumber, shipped 778,000,000 feet, and accepted orders for 613,000,000 feet.

Newsprint Production Increasing

The Canadian and United States production of newsprint paper during 1917 is estimated to be 1,940,000 tons, as compared with 1,816,000 tons total for 1916 and 1,644,000 tons for 1915. The actual production up to July 31 indicates that the estimated production for 1917 will be reached, unless there is some further interference in manufacture during the remainder of the year due to labor shortage.

According to the official statement of receipts and expenditures of the Province of Quebec for the fiscal year ending June 30 last, the receipts from lands and forests were $1,753,624, while the expenditure was $361,150.

The British Board of Trade has taken possession of all stocks in Great Britain of mahogany and American walnut lumber in logs, planks and boards containing more than 5,000 feet.

A meeting of sawmill employees was held recently at Vancouver, in the Labor Temple, to discuss a proposal for organizing the employees in the industry. Further meetings are expected to be held.

Cost Accounting for Wooden Box Plants

National Association of Box Manufacturers Adopt System Worked Out by Special Committee and Recommend It for Use

The wooden box industry, like a great many other important industries, has never had a uniform system for cost finding and cost accounting. To know what it costs to produce a finished product, not only in its complete form, but the cost of each operation which goes to make up the completed article, is just as necessary and essential to every manufacturer as it is to keep a factory supplied with raw materials and a sufficient amount of labor to produce a finished product. The conditions prevailing in the wooden box industry have changed rapidly during the past few years, and still greater changes will take place during the succeeding years. All raw materials from which wooden boxes are constructed have inceased in value; labor is demanding more money, less hours, and an apparent shortage prevails, as well as inefficiency.

It is a recognized fact in all business, particularly those that are well established through the efforts of their respective associations, that one of the most important factors confronting the business man of to-day is the keeping of a cost record in such a manner as will show him in every detail what it is costing to produce. In order to compete intelligently with their special line of production they must know what it costs to produce, and this cost of production should be so segregated that each department will bear its proper proportion of the cost, and that the sales will, of necessity, show the result of such cost finding and cost keeping. Further, the man who is operating his business without any idea of what it is costing to produce a certain article is, generally speaking, the most vicious competition existing.

Every man who is producing a product of a manufactured nature has a right to expect a legitimate profit from his efforts, and it is the man who does not keep any record of costs that sets the mark of ridiculous competition. Unless each manufacturer knows what it costs to do certain things he is not in a position to know what a legitimate selling profit is. With all of these facts confronting the wooden box industry, the National Association of Box Manufacturers saw the imperative necessity of developing some system for cost finding and accounting, simple in construction, easy of application, adaptable for any kind of a wooden box manufacturing plant, yet accurate, and which when installed and in operation, would place the manufacturer in a position to know all those details which in the past have been a matter of guesswork.
